their bodies, due to the very same cause as the human beings also do; for in this respect they are similar. That is why the four-footed animals also bend their front legs forward in the way just stated. For if in fact their bending takes place in this way, the animals will be able to raise their feet from the ground high in the air. But if they bent their front legs in the contrary direction, they would raise them from the ground only a little, because the entire thigh and the joint from which the shin naturally grows would be underneath the belly as the animal moves forward. On the other hand, if the bending of the back legs were forward, the raising of the feet would be like that of their front legs (for the bending that is in accord with leg lifting would be short in these animals, since both the thigh and the joint would fall under the abdomen). But if they bend their back legs backward, as they actually do, nothing impedes their progression in such a movement of the feet. Further, for those among them that are nursing, and with a view to this sort of service, it is necessary or better, at any rate, for their legs to be bent in this way; for it would not be easy for them to have their children underneath and to protect them if their legs were bent inward.

13
Limb Bending

712a1 There are four ways of bending when the legs are taken in pairs; for it is necessary for both front and back legs either to bend toward the concave, as in A [Fig. 2], or in the contrary way, toward the convex, as in B, or else in converse ways, not both in the same direction, but rather the front legs toward the convex and the back legs toward the concave, as in C, or in a way contrary to this, each pair of legs toward the convex in relation to the other with their concave facing outward, as in D.

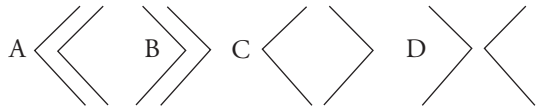

Fig. 2

None of the two-footed or four-footed animals bends its legs as in A or B; the four-footed animals bend their legs as in C, whereas none of the four-footed animals, except the elephant, bends its legs as in D. The human being bends its arms and legs in this way: it bends its arms toward the concave and its legs toward the convex.

The bending of limbs is always alternately and in contrary directions in human beings: the elbow bends toward the concave, while the wrist toward the convex, and again the shoulder toward the convex. It is likewise too with the legs: the hip bends toward the concave, the knee toward the convex, and the foot in a contrary

way toward the concave. And clearly the lower limbs bend in a contrary way to the upper limbs; for the starting-point of movement bends in contrary directions: the shoulder bends toward the convex, and the hip toward the concave. That is also why the foot bends toward the concave, and the wrist of the hand toward the convex.

14
Diagonal Leg Movement in Four-Footed Animals

The bendings of the legs are arranged in this way and due to the causes stated. The back legs move diagonally relative to the front legs: after the right front leg, four-footed animals move the left back leg, then the left front leg, and after it the right back leg. The cause of this is that if they moved the front legs at the same time and first, they would be strained, or else their walking would even be a case, as it were, of falling forward with their back legs dragged after. Further, such a movement would not be progression but jumping, and it would be difficult to produce continuous change by jumping. Here is a sign of this; for all the horses that in actual fact move in this way quickly get tired—for example, procession horses. Because of these things, then, the four-footed animals do not make their movement separately with their front and back legs, while if they made it with both right legs first, they would be outside of their supports, and would fall. If it **712b1** is necessary, then, for them to move in one or another of these two ways or else diagonally, and neither one of the first two ways is possible, it is necessary for them to move diagonally. For by moving in the way stated they can avoid suffering either one of these things.[26] That is why horses and all animals of this sort stand after having advanced with their legs diagonally, and not with both right or both left legs at the same time.

And those animals with more than four feet make their movement in the same way; for in the next set of four feet, the back legs always move diagonally relative to the front legs. This is clear in animals that move slowly. Crabs move in the same way too, for they are among the many-footed animals. For they too always move in accord with the diagonal, in whichever direction they make their progression. In fact, this animal makes its movement in a special way, for it is the only animal that does not move forward but rather obliquely. But since what is forward is distinguished in relation to the eyes, nature has made the eyes [of the crab] able to follow its legs; for their eyes move obliquely, so that, in a way, crabs too move, because of this, forward.

26. I.e., jumping and tiring, or straining and falling.

15
Leg Bending in Birds and Four-Footed Egg-Laying Animals

The birds bend their legs just as the four-footed animals do; for in a way the nature of their legs is pretty much the same; for in the birds wings are in place of front legs. That is also why they are bent in the same way as the front legs of four-footed-animals, since when it comes to their progressive movement, the starting-point of movement that is in accord with their nature is from the wings; for flight is their proper movement. That is why, if its wings were removed, no bird would be able to stand or move forward.

Further, because the bird is two-footed and not upright, and the front parts of its body are lighter, it is either necessary or better for its being able to stand that the thigh be placed under the animal, as is in fact the case. (I mean growing toward the back.) But if the thigh must be placed in this way, it is necessary for the bending of the leg to be toward the concave, just as in the case of the back legs of four-footed animals, and due to the same cause that we stated[27] in the case of the four-footed live-bearing animals.

In general, in the birds, the flying animals that are whole-winged, and the animals that swim in water (those that make their progression in water by means of instrumental parts), it is not difficult to see that it is better for the attachment of the parts mentioned to be oblique, just as appears to be in actual fact the case in the birds and the whole-winged animals. This very same condition also holds for the fishes. The feathered wings in the birds, the fins in the aquatic animals, and the wing-like membranes in the whole-winged animals are attached obliquely. For in this way they can make their movement most quickly and most efficiently, the ones by dividing the air, the others by dividing the water; for the back parts of their body can follow forward too, since they are carried along in a medium that gives way, the ones in water and the others in air.

As for the egg-laying four-footed animals that are hole-dwellers (for example, the crocodiles, the lizards, the geckos, the freshwater turtles, and the sea turtles), they all have their legs attached obliquely and stretched out upon the ground, and they bend them obliquely, because in this way their legs are useful for ease of retiring underground and for sitting on their eggs and protecting them. Since their legs project outward, these animals must tuck in their thighs and put them underneath themselves in order to make their whole body rise. But when this happens, they cannot bend their legs in any other way than outward.

27. 711b12–28.

16
Leg Bending in Bloodless Animals

We stated earlier[28] that the footed animals that are bloodless are many-footed, and none is four-footed. That it is necessary for their legs, except for the extreme pairs, to be attached obliquely, to have their bending upward, and to be somewhat bowed backward is evident. For in all animals of this sort, the intermediate legs must both lead and follow. If, then, the legs were underneath them, they should bend both forward and backward; forward to lead, and backward to follow. But since their **713b1** legs must do both, because of this they are bowed and also bend obliquely, except for the extreme pairs; these move more naturally: one pair of legs leads, the other pair follows. Further, their legs are bent in this manner also due to their number; for in this way they would be less likely to impede each another in their movement and to hit against one another. And they are bow-legged because either all or most of these animals are hole-dwellers; for it is not possible for animals living in this way to be tall.

17
Leg Bending and Leg Movement in Crabs

Crabs have the most extraordinary nature of all the many-footed animals; for they do not progress forward except in the way stated previously,[29] and they alone among animals have many leading feet. The cause of this is the hardness of their feet and the fact that they use them not for the sake of swimming but of progressing on land; for their mode of living is to proceed along the ground.

All the many-footed animals, then, have their bends obliquely, just like those four-footed animals that are hole-dwellers—for example, the lizards, the crocodiles, and many of the four-footed animals that lay eggs are of this sort. The cause is that they live in holes, some only during the breeding season, and others throughout their entire life. But the legs of all the other many-footed are bowed because they are soft-skinned; the legs of the crayfishes, though, being hard-skinned, are used for the sake of swimming, not of walking.

The bending of the crab's legs is oblique, and they are not bowed as in the four-footed egg-laying animals and the bloodless many-footed ones; the legs are hard-skinned and hard-shelled because the crab is not a swimmer and lives in holes; for its mode of life is on the ground. And it is round in shape and does not have a tail like the crayfish; for a tail is useful to the crayfish for swimming, but the crab is not a swimmer. And the crab alone has the side like the back because of having

28. 707a20–23.
29. 712b13–21.

many leading feet; the cause of this is that its legs do not bend forward and are not
714ᵃ1 bowed. The cause of their not being bowed was stated previously;[30] the skin of the crab is hard and is like that of a hard-shelled animal. It is necessary, because of this, for it to lead off with all its legs and obliquely: obliquely, because the bending is
5 oblique; with all its legs, because otherwise those at rest would be an impediment to those moving.

18
Animals That Live in Water

The *psetta*-like fishes[31] swim in the way one-eyed humans walk; for their nature is distorted. Web-footed birds swim with their feet, and because they take in air and
10 breathe, they are two-footed; but because they have their mode of life in liquid, they are web-footed; for their feet, since they are of this sort, serve them in place of fins. They have their legs, not in the center of their body like the other birds, but placed rather toward the back; for since they are short-legged, their legs, being set back, are useful for swimming. Birds of this sort are short-legged because nature has taken
15 away from the length of their legs and added to their feet, that is, it has provided the legs with thickness instead of length and the feet with broadness; for, being broad, they are more useful than if they were long for pushing away the water when they are swimming.

20 It is also reasonable that winged animals have feet while fishes have none. For the mode of life of the former is on dry land and they cannot always remain in the air, so they necessarily have feet. But the mode of life of the fishes is in liquid, and they take in water, not air. Their fins, then, are useful for swimming, whereas feet would be useless. If they had both, they would be bloodless. But the birds in a way resemble the fishes; for the birds have their wings in the upper part, while the fishes have two
5 fins near the head; and, while the birds have feet on their underpart, most of the fishes have fins on their underpart near their front fins; also, the birds have a tail, the fishes a tail fin.

19
Hard-Shelled Animals

As regards hard-shelled animals, one might raise a puzzle as to what their movement is, and if they have no right and left side where they move from; for they do appear
10 to move. Or must one posit that this entire kind is deformed—moving as a footed

30. 713ᵇ14–16.
31. *HA* 538ᵃ20.

animal would do if one were to cut off its legs—like the seal[32] and the bat; for these animals are four-footed, but in a bad way. The hard-shelled animals do move, then, but they do so in a way contrary to nature; for they are not really able to move, but rather taken as animals that are stationary and attached, they can move, and taken as animals that move by progression, they are stationary.

Crabs too have their right side defective, since they do have it. The claw makes this clear; for the right claw is bigger and stronger, as though the right and the left wished to be differentiated.

As for the parts, both the other parts and those that have to do with the progression of animals and with all change with respect to place, things are arranged in this way. With these determinations in place, the next thing is to get a theoretical grasp on the soul.[33]

32. *HA* 498ᵃ31–ᵇ4, *PA* 697ᵇ1–13.

33. The order of treatises suggested by this epilog is *PA*, *IA*, *DA*, but *PA* refers back to *IA* three times (690ᵇ15, 693ᵃ17, 696ᵃ10–13), and *DA* seems to logically precede *PA*, making the precise order difficult to determine with certainty.

ON THE GENERATION OF ANIMALS*

BOOK 1

1.1
The Focus of the Treatise; Male and Female as Starting-Points

The other parts present in animals have been spoken about,[1] both in common and with respect to the special affections of each particular kind separately, and what way each part is due to this sort of cause—I mean, the for-the-sake-of-which; for there are four underlying causes: the for-the-sake-of-which as end, the account of the substance (and these must be taken pretty much as one[2]), third and fourth, the matter and where the starting-point of the movement comes from. The others, then, have been spoken about (for the account and the for-the-sake-of-which as end are the same, and the matter for the animals is their parts—for the animal as a whole, the non-uniform parts, for the non-uniform parts, the uniform ones, and for these, the so-called elements of bodies), but it remains to speak about the parts that contribute to the generation of animals, about which nothing was determined previously, and about what sort of starting-point the cause of the movement is. And to investigate this latter cause and to investigate the generation of each animal is in a way the same. That is why the account has brought them together as one, by putting these parts at the end of our accounts of the parts, and the accounts of the starting-point of generation next after them. **715ª1**

Among the animals, some come to be from the copulation of female and male, namely, in those kinds in which there exist both the female and the male; for they do not exist in all, but rather in those blooded ones, with few exceptions, in which the male and the female are completed, and in those bloodless ones which, though some have the female and the male, so that they generate offspring of the same kind as themselves. Others, though they do generate offspring, the offspring are certainly

1. *PA*.

2. *PA* 639ᵇ11–21.

not of the same kind. The ones that come to be not from animal copulation but from putrefying earth and from residues[3] are of this sort.[4]

Generally speaking, however, among all those that are capable[5] of changing with respect to place, whether by swimming, flying, or walking, the female and the male exist—and this applies not only to the blooded ones, but also to some bloodless ones. And among the latter, sometimes it applies to the whole kind (for example, the soft-bodied animals and the soft-shelled animals), but in the insect kind [only] to the majority. Among these, the ones that come to be from the copulation of animals of the same kind also generate in accordance with sameness of kind. On the other hand, those that come to be not from animals but from putrefying matter generate something of a distinct kind, and what is generated is neither female nor male. Some of the insects are of this sort.[6] And this happens reasonably; for if from the ones that are not generated from animals, animals came to be by copulating, if these were of the same kind as themselves, then from the start the coming to be of their procreators should have been the same way (for this is what we reasonably expect; for it is evident that it is so in the case of the other animals). But if they are not of the same kind but capable of copulating, there should again be generated from them things of a distinct nature, and again from these something of a distinct nature, and this should go on without limit. Nature, however, avoids the unlimited; for the unlimited is without an end, while nature always seeks an end.

Those that do not move by walking, like the hard-shelled animals and those that live by being attached to something, because their substance is much the same as that of the plants, just as in the latter ones, so in these, the female and the male do not exist—although they are in fact said to be female or male by way of similarity and by analogy; for the difference of this sort that they exhibit is small. For even in plants we find in the same kind some trees that are fruit-bearing and others that, while not bearing fruit themselves, contribute to the concocting of what is borne by the others, as happens, for example, with the fig and the caprifig.[7]

{It is the same way in plants too; for some come to be from seeds, others, as it were, by the spontaneous operations of nature. For they come to be when either the earth or certain parts of [other] plants putrefy; for some of them are not composed separately by themselves but come to be on other trees—for example, mistletoe.}[8]

Plants, however, must be investigated separately by themselves.[9]

1.2
The Sexes and Sexual Parts

As for the generation of the various animals, we must speak about it in accord with the account that falls to each of them, connecting it to what has just been said. For, as we have said, one may posit as the starting-point of their generation nothing less than the female and the male, the male one as containing the starting-point of the movement and the coming to be, the female one as containing that of the matter. One may be most persuaded of this by getting a theoretical grasp on how the seed comes to be and from where; for though what is composed by nature comes to be from seed, we must not fail to notice how it comes to be from the female and from the male. For it is because a part of this sort is secreted from the female and the male, the secretion being in these and from these, that the female and the male are starting-points of the generation. For by a "male animal" we mean what generates in another, by a "female" what does so within itself. That is why even in the case of the whole universe people consider the nature of the earth as female and mother, but address heaven, the sun, or anything else of this sort as progenitors and fathers.

The male and the female, however, differ with respect to their account, because each is capable of a distinct thing, and with respect to certain of their perceptible parts: with respect to their account, because the male has the capacity to generate in another, as was said previously,[10] while the female has the capacity to generate within itself, that is, it is what the thing that comes to be, which was present in the progenitor, comes to be from. But since they are distinguished by their capacity and by a certain work, and since instruments are needed for all work, and since the parts of the body are the instruments of the capacities, it is necessary for there to be parts for procreation and copulation, and for these to differ from each other, and with respect to which the male will differ from the female. For even if the whole animal is said to be, on the one hand, the female and, on the other, the male, it is not in virtue of it as a whole that it is female or male, but in virtue of a certain capacity and in virtue of a certain part (just as with both seeing and moving by walking), precisely the one that is evident to perception.

In all blooded animals, in fact, such parts in the female are called the "uterus," and in the male "the ones having to do with the testicles and the penis"; for some of them have testicles and other ducts of this sort. But there are differences too between the female and the male in those bloodless ones that among themselves have this contrariety, although in the blooded ones the parts for intercourse differ in their configurations. One must understand, however, that when [even] a small starting-point changes, it is usual for many of the things that follow the starting-point to change along with it. This is clear in the case of castrated animals; for though the generative part alone is destroyed, pretty much the whole shape of the animal changes

10. 716[a]14.

along with it to such an extent that it seems to be female or not far short of it, suggesting that it is not in virtue of some random part or in virtue of some random capacity that the animal is female or male. It is evident, then, that the female and the male appear to be a sort of starting-point. At any rate, when an animal changes in that wherein it is female or male, many things change along with it, suggesting that a starting-point is undergoing a change.

1.3
Testicles and Uterus in Different Animals

As regards the testicles and the uterus—and in the first place as regards the testicles in the males—they are not the same way in all the blooded animals; for some animals of this sort do not have testicles at all (for example, the fish kind and the snake kind), but only two spermatic ducts. Others do have testicles, but have them inside, near the loin, by the region of the kidneys, and from each of them a duct runs (as in the animals that have no testicles), and these join together into one (again like those others)—for example, among animals breathing air and having a lung, all the birds and the egg-laying four-footed animals. For all these too have their testicles inside, near the loin, with two ducts leading from them in a similar way to the snakes—for example, the lizards, the turtles, and all the hard-scaled animals. But all the live-bearing ones have their testicles in the front, though some of them (for example, the dolphin) have them inside, at the end of the abdomen, and have no ducts but rather a sex organ reaching from them to the outside (for example, the ox fish[11]). Others have the testicles outside, either detached (like the human being) or near the fundament (like the pigs). More exact determinations about these have been made in the *History of Animals*.[12]

Every uterus[13] is bipartite, just as the testicles in all males are two. Some animals have it near the sexual parts (as do women, all animals that are live-bearing not only externally but also internally, and all fishes laying eggs that are visible to the eye), others near the diaphragm (as all the birds and live-bearing fishes). The soft-shelled and soft-bodied animals also have a bifurcated uterus. For the[14] membranes encompassing their so-called eggs are uterus-like.

The uterus is most indistinct in the octopuses,[15] so that it appears to be unipartite. The cause of this is that the mass of the octopus's body is similar at every point. It is bifurcated too in the larger insects, while in the smaller ones it is invisible due to the smallness of the body.

This, then, is the way the parts that were mentioned are in the animals.

1.4
Differences in the Spermatic Instruments in Males (1)

With regard to the difference in the spermatic instruments in males, if we are going to get a theoretical grasp on the causes it is due to, it is necessary first to grasp what the testicles are composed for the sake of. If nature makes everything either because of what is necessary or because of what is better, this part too should exist because of one of these two things. That it is not necessary for generation is evident; for then every progenitor would have it. But as things stand neither the snakes nor the fishes have testicles; for they have been seen copulating and with their ducts full of seminal fluid. It remains, then, for it to be for the sake of what is better.

The work of most animals is pretty much nothing other than that of plants, namely, [to generate] seed and fruit. But just as in the case of nourishment, where animals with straight intestines are greedier in their appetite for nourishment,[16] so the ones that have no testicles but only ducts, or that do have them but have them internally, are all quicker in the activity of copulation. But those that need to be more temperate, as in the one case they have non-straight intestines, so in the other case they have helices in their ducts, to prevent their appetite from being quick or greedy.[17] It is for this that the testicles have been contrived; for they make the movement of the spermatic residue more still: in the live-bearing ones (for example, in the horses and others of this sort and also in the human beings), they do this by preserving the doubling-back [of the ducts] (one must observe the way they do this with the help of the *History of Animals*[18]). For the testicles are no part of the ducts, but attached to them, just like the stone weights that women attach to their looms when weaving—for if these are removed, the ducts are drawn up internally, so that castrated animals are incapable of generating, since if the ducts were not drawn up, they would be capable of it. In fact, a bull immediately after castration has been known to mate with and impregnate a cow because the ducts had not yet been drawn up.

In the birds and the egg-laying four-footed animals the testicles receive the spermatic residue, so that its emission is slower than in the fishes. This is evident in the case of the birds; for their testicles are much larger around mating time.[19] And those birds that mate at one season of the year have such small ones when this time has passed that they are pretty much indiscernible, but around mating time they are very large.

The ones having the testicles internally mate more quickly; for in fact those having them externally do not emit seed before the testicles are drawn up.

18. $510^{a}12–^{b}4$. The ducts are the epididymis and the vasa deferentia.
19. *HA* $509^{b}35–510^{a}7$.

1.5
Differences in the Spermatic Instruments in Males (2)

Further, the four-footed animals have the instrument for copulation; for it is possible for them to have it, but for the birds and the footless animals it is not possible, because the former have their legs under the middle of their abdomen, and the latter have no legs at all, and it is the nature of the sex organ to hang there and the position for it is to lie there. (That is also why in sexual intercourse there is tension of the legs; for the sex organ is sinewy and the nature of the legs is sinewy too.) So, since it is not possible for them to have this instrument, it is necessary either for them also to have no testicles, or else not to have them there; for in those animals that have [both penis and testicles], the position of both is the same.

Further, in those animals, at any rate, that have external testicles, it is because of the movement of the heated-up sex organ that the seed is gathered together before emission: it is not ready immediately on making contact, as with the fishes.

All the live-bearing animals have their testicles in front, either inside or outside, except the hedgehog. This one alone has them near the loin. This is due to the very same cause as it is also due to in the birds. For it is necessary for their copulation to take place quickly; for unlike the other four-footed animals, they do not mount on the back, but have intercourse standing upright because of their spines.

The cause due to which animals that have testicles have them has now been stated, as has the cause due to which some have them outside, others inside.

1.6
Differences in the Spermatic Instruments in Males (3)

The ones that do not have testicles do not have this part, as was said, not because not having it is good but only because it is necessary, and because it is necessary for their mating to take place quickly. The nature of the fishes is of this sort, as is that of the snakes; for the fishes mate by placing themselves side to side and quickly ejaculating. For just as in the case of the human beings and in all the others of this sort it is necessary to hold in the breath before emitting the semen, so fishes at such times must not take in seawater, and they easily pass away if they do not do this. Therefore, they must not concoct their seed during copulation, as the live-bearing terrestrial animals do, but instead have their seed concocted and gathered together at the proper time, so that they do not concoct it while making contact with each other but emit it already concocted. That is why they have no testicles, but rather straight and simple ducts, like the small part around the testicles that four-footed animals have; for of the part of the duct that is doubled back one part is blooded and another bloodless,[20] and

20. The latter is the vas deferens, the former the epididymis.

this latter part receives the liquid that, when already seed, travels through it, so that when the seed has arrived there, ejaculation takes place quickly in these animals too. In fishes the whole of the duct is like this latter part of it in the case of the human beings and other animals of this sort, that is, the other [straight, bloodless] part of what is doubled back.

1.7
Differences in the Spermatic Instruments in Males (4)

The snakes mate by twining around each other, but do not have testicles or even a sex organ, as was said previously[21] (no sex organ, because they have no legs either; no testicles because of their length), but rather ducts just as the fishes do; for because their nature is to be so long, if there were further delay having to do with testicles, the semen would get cooled down because of its slow progress. This is precisely what happens in the case of those with large sex organs; for they are less fertile than those who have more moderately sized ones because cold seed is not fertile, and it gets cooled down by traveling too great a distance. Due to which cause some animals have testicles while others do not have them has now been stated.

The snakes intertwine with each other because they are not naturally suited for placing themselves side to side. For being so long, and the part by which they attach themselves being so small, they are not easily fitted together. Since, then, they have no parts with which to embrace, instead of this they make use of the suppleness of their bodies, twining around each other. Because of this too they seem to be slower to ejaculate than fish, not only because of the length of the ducts, but also because of the care taken about these proceedings.

1.8
The Uterus; Live-Bearing and Egg-Laying Animals; Complete and Incomplete Eggs

In the case of females, one might raise a puzzle about the way the uterus is; for many contrarieties are found in this. For not even all the live-bearing ones have it in a similar way, but rather the human beings and all the terrestrial animals have the uterus low down near the sexual parts, while the live-bearing selachians[22] have it higher up near the diaphragm; nor do the egg-laying ones, but rather the fishes **718^{b}1** have it low down just like the human being and the live-bearing four-footed animals,

21. 717^{a}18 mentions only a lack of testicles.
22. *HA* 6.10–11.

while the birds have it higher up as do the egg-laying four-footed animals. Yet even these contrarieties are in accord with reason.

For first of all the egg-laying ones have different ways of laying their eggs; for some eggs are incomplete when emitted—for example, those of the fishes; for the eggs of the fishes are completed and do their growing outside. The cause is that the fishes are prolific; in fact, this is their work, just as it is of plants. If, then, the fishes were to complete their eggs inside themselves, it would be necessary for these to be few in number. But as things stand, they have so many that each uterus seems to be [all] egg, at any rate, in the small fishes; for these are the most prolific of all, just as in the case of other things—both among the plants and among the animals—that have a nature analogous to theirs; for growth in size turns in them to seed.[23]

The birds, however, and four-footed egg-laying animals lay eggs that are complete, which must, for preservation, be hard-skinned (for they are soft-skinned until they have grown). But their shell comes about due to heat, which evaporates the liquid from the earthen material. It is necessary, then, for the place where this will happen to be hot. And the one around the diaphragm is like this; for it in fact concocts the nourishment. If, then, it is necessary for the eggs to be within the uterus, it is also necessary for the uterus to be near the diaphragm in those animals that lay eggs that are complete, but to be low down in those that lay incomplete ones. This way it will be advantageous. Also, it is more natural for the uterus to be low down rather than high up, whenever there is not some other work of nature to prevent it; for the limit of the uterus[24] is low down too; where the limit is, there the work is too, and the uterus is where its work is.

1.9
Internally and Externally Live-Bearing Animals

The live-bearing animals too exhibit difference in relation to each other. For some live-bear, not only externally but also internally[25]—for example, the human beings, the horses, the dogs, and all those having hair, and among aquatic animals, the dolphins, the whales, and the soft-bodied animals of this sort.

23. Because both blood and seed are residues from nourishment, which is what produces growth (726[b]1–11).

24. Probably, the opening from which the eggs emerge.

25. I.e., without first producing an egg. The microscopic mammalian egg was unknown to Aristotle.

1.10
Internally Egg-Laying and Externally Live-Bearing Animals

The selachians and the vipers, though they live-bear externally, first lay eggs internally. And the egg they lay is a complete one; for this is the way an animal is generated from the egg, while from incomplete ones nothing is generated. They do not lay eggs externally because they are cold in their nature, and not, as some people say,[26] hot.

1.11
More on the Uterus and Its Placement

At any rate, the eggs the [selachians and vipers] generate are soft-skinned; for, because they have so little heat, their nature does not dry the extremity [of the egg]. It is because of their being cold, then, that they generate soft-skinned ones, and because they are soft-skinned they do not do so externally; for they would have been destroyed. **719^{a}1**

When the animal comes to be from an egg, the way it comes to be is mostly just the same as the one in which the birds come to be, that is, [the egg] descends and the animal comes to be near the sexual parts, just as in those animals too that are live-bearing from the outset. That is also why in animals of the sort we are discussing the uterus is dissimilar to that of both the live-bearing and the egg-laying animals, because they participate in both forms; for in all the selachians it is at once near the diaphragm and stretching along downward. (But one must observe the way this and the other sort of uterus are with the help of the *Dissections* and the *History of Animals*.[27]) So, because they are egg-laying and lay complete eggs, the selachians have their uterus high up, but because they are live-bearing, they [also] have it low down, participating in both.

Animals that are live-bearing from the outset all have the uterus low down; for this impedes no work of nature nor do they double-bear.[28] In addition, it is impossible for an animal to come to be near the diaphragm; for fetuses necessarily possess heaviness and movement, and that place, because it is vital for life, would not be capable of enduring these things. Further, delivery would necessarily be difficult because of the length to be traveled, since, even as things stand, in the case of women, if they draw up the uterus around the time of giving birth, by yawning or doing something of this sort, they have a difficult delivery. But even when empty the uterus produces a stifling sensation if moved upward. And in fact it is necessary, if it is going to contain an animal, for the uterus to be stronger [than in egg-laying animals], which is why it is fleshy in all the live-bearing ones, while those that are near the diaphragm are

26. E.g., Empedocles (*Juv.* $477^{a}32$–$^{b}5$).
27. $510^{b}5$–$511^{a}34$.
28. I.e., they are not both egg-laying and live-bearing.

membranous. And in the case of those that double-bear it is evident that this is so; for they hold their eggs high up and on the side, but hold the living young in the lower part of the uterus.

What the cause is due to which the uterus is present in contrary ways in some animals, and, in general, why in some it is low down, in others high up near the diaphragm, has now been stated.

1.12
Placement of Uterus and Testicles

Why do all animals have the uterus inside, while some have their testicles inside, others outside? The cause of the uterus being inside in all animals is that what is coming to be is in this, and it needs safeguarding, shelter, and concoction, while the place outside the body is easily harmed and cold. The testicles are outside in some animals, inside in others. But because[29] they also need shelter and a covering to preserve them, and for the concoction of the seed (for when chilled and stiffened, it is impossible for them to be drawn up and emit semen), those animals that have their testicles visible have a shelter of skin over them called the "scrotum." Those, on the other hand, the nature of whose skin opposes this arrangement, because it is very hard and is neither capable of enclosing them nor of being softened and is like [true] skin,[30] necessarily have them inside—for example, those that have fish-like skin or are hard-scaled. That is why the dolphins and those cetaceans that have testicles have them inside, as do the hard-scaled animals that are egg-laying and four-footed. And the skin of the birds is also hard, so that it will not conform to the magnitude of anything and enclose it—in fact, this is a cause in all these cases [of their having their testicles inside] that is in addition to the others stated previously, stemming from facts about the necessities of mating. Due to the same cause the elephant and the hedgehog also have their testicles inside; for in their case too the skin is not naturally well-disposed to keeping the sheltering part separate.

{Contrary positions for the uterus are also found in those animals that are live-bearing internally and in those that are externally egg-laying, and in the latter again some have it low down, others near the diaphragm—for example, the fishes in comparison to the birds and the egg-laying four-footed animals. And [it is different again] in those that generate in both ways, being egg-laying internally and live-bearing externally. For those that are live-bearing both internally and externally have their uterus placed on the abdomen—for example, the human being, the cow, the dog, and the others of this sort. For it is advantageous for the protection and the growth of the fetus that no weight be put on the uterus.}[31]

31. Perhaps to be secluded as an inaccurate recollection of the preceding chapters.

1.13
Excretory and Spermatic Ducts in Females and Males

The duct through which the dry residue and that through which the liquid one issues are also distinct in all these animals. That is why all animals of this sort, both male and female, have sex organs by which the liquid residue is excreted, and in males the seed, and in females the embryo. This duct is above and in front of the duct for [the excretion] of the dry nourishment. {All animals that are egg-laying animals but lay incomplete eggs—for example, the egg-laying fishes—have their uterus not under the abdomen but near the loin; for the growth of the egg does not impede this, because what is grown is completed and develops outside.}[32] The duct is the same as that for the solid nourishment[33] in those animals that have no generative sex organ, all the egg-laying ones, even in those of them that have a bladder—for example, the turtles; for it is for the sake of generation, not for the excretion of liquid residue, that the ducts are twofold. And because the nature of seed is liquid, the residue of the liquid nourishment also shares the same duct. This is clear from the fact that though all animals bear seed, liquid residue does not occur in all of them.

Since, then, the spermatic ducts in males must be fixed in position and not wander about, as must the uterus in females, and it is necessary for this fixing to take place at either the front or the back of the body, in live-bearing animals, because of the fetuses, the uterus is in the front, in egg-laying ones it is at the back near the loin, and those that are internally egg-laying but externally live-bearing have them both ways, because they participate in both, being both live-bearing and egg-laying; for the upper part of the uterus, where the eggs come to be, is under the diaphragm near the loin and the back, but its continuation[34] is low down near the abdomen; for it is in this part that it is actually live-bearing. And there is one duct in these animals for the dry residue and for mating; for none of them, as was said previously,[35] has a detached sex organ.

The ducts of males, whether they have or do not have testicles, are similar to the uterus of the egg-laying animals; for in all of them they are attached near the back over against the place of the spinal column; for they must not wander about, but rather be fixed in position, and the place at the back is of this sort; for it provides continuity and stability.

In those that have their testicles inside, indeed, they are fixed in position from the outset, and similarly in those that have them outside. Then they meet and unite near the place of the sex organ.

32. This sentence clearly belongs with the other bracketed material at the end of 1.12.
33. Secluding καὶ.
34. Reading προϊοῦσα.
35. $716^{b}13$–32, *HA* $509^{a}35$–$^{b}3$.

The ducts are also similar in the dolphins, although they have their testicles hidden under the abdominal cavity.

How the animals have the parts positioned that have to do with contributing to **720[b]1** generation, and due to what causes, have now been stated.

1.14
Soft-Shelled Animal Copulation

In the case of the other animals, the bloodless ones, the way they have the parts contributing to generation is neither the same as among the blooded ones nor among themselves. We have four kinds remaining: first, the soft-shelled animals; second, the soft-bodied animals; third, the insects; and fourth, the hard-shelled animals (but though it is not clear about all of them, it is evident that most of them do not copulate; in what way they get composed must be stated later[36]).

The soft-shelled animals copulate like the animals that urinate backward, when, with one supine and the other prone, they fit their tails together; for their tails, because they have long flaps attached to them, prevent them from mounting with underneath parts to back parts. The males have thin spermatic ducts, while the females have a membranous uterus alongside the intestine, divided on either side, in which the egg is generated.

1.15
Soft-Bodied Animal Copulation

The soft-bodied animals intertwine at the mouth, pushing against each other and twining together their tentacles. This way of twining together is of necessity; for nature has turned around the end of the duct for residues and brought it near the mouth, as was said previously.[37] The female in each of these animals, it is evident, has a uterus-like part; for it contains an egg which at first is indistinct, but then becomes disaggregated into many, each of which is incomplete when it is laid, as with the egg-laying fishes. And the same duct is for the residues and for the uterus-like part both in the soft-shelled animals and in these. For it is through this duct that the animal emits its ink, and it[38] is on the underneath parts of the body where the mantle is open and the seawater enters in.

That is why the copulation of the male with the female takes place at it; for if indeed the male emits something, whether seed or a part,[39] or some other capacity,

38. Reading ἔστι γὰρ ᾗ τὸν θολὸν ἀφίησι διὰ τοῦ πόρου, τοῦτο δ᾽ἐστὶν.
39. Perhaps the so-called hectocotylized tentacle.

it is necessary for him to have sex with her at the uterus-like duct. But in the case of the octopuses, the insertion of the tentacle of the male through the funnel of the female, by which tentacle the fishermen say he mates, is for the sake of their twining together, not as an instrument useful for generation; for it is outside the duct [of the male], indeed outside his body.

Sometimes too the soft-bodied animals copulate front down, but whether for the sake of generation or due to some other cause has not been observed yet. **721^{a}1**

1.16
Insect Copulation; "Spontaneous Generation"

Among the insects, some copulate, and the generation of them is from synonymous[40] animals (just as in the case of the blooded animals)—for example, the locusts, the cicadas, the spiders, the wasps, and the ants. Others, although they copulate and generate, do not generate things of the same kind as themselves but larvae only, nor do these come to be from animals, but rather from putrefying liquids, and some from putrefying dry materials—for example, the fleas, the flies, and the cantharides. Others again neither come to be from animals nor do they copulate, like the gnats, the mosquitoes, and many such kinds.[41]

In most of the sorts that copulate, the females are larger than the males; and the males do not appear to have any spermatic ducts. And the male, speaking of what holds in the majority of cases, does not insert any part into the female, but rather the female does so upward from below into the male. This has been observed in many cases, the contrary in few. But we have not yet been able to see how to divide them by kind.

And this is so too in the case of pretty much the majority of the egg-laying fishes, also in the case of the four-footed animals that are egg-laying; in fact, the females are larger than the males because of its being advantageous to them due to the mass of eggs generated during pregnancy. And in the females of these the part analogous to the uterus is divided and alongside the intestine, as in the other animals, and the embryos come to be in it. This is clear [only] in the case of the locusts and whatever, having the size of these, naturally copulates; for most insects are too small [for this to be clear].

These, then, are the ways the generative instruments in animals, which were not spoken about previously,[42] are. Of the uniform parts left aside there, semen and milk, about these it is now the opportune time to speak—about semen immediately, about milk in what follows.[43]

1.17
Do All Animals Emit Seed? Pangenesis

It is evident that some animals emit seed—for example, those whose nature is to be blooded. But whether the insects and the soft-bodied animals do so or not is unclear. So this is something we must get a theoretical grasp on, whether all male animals emit seed, or not all of them do, and if not all of them do, what the cause is due to which some do while others do not. Also, whether the females too contribute any seed or not, and if not seed, whether nothing else at all, or though they do contribute something, it is not seed. Further, we must also investigate what the ones that do emit seed contribute to generation by means of their seed, and, in general, what the nature of seed and of so-called menses is, in the case of those animals that emit these liquids.

It seems that all come to be from seed, and the seed from the progenitors. That is why it belongs to the same account to ask whether both female and male emit it or only one of the two, and whether it comes from all the body or not from all; for it is reasonable to suppose that if it does not come from all of it, neither does it come from both progenitors. That is why, since some people say that it comes from all the body,[44] we must investigate how things stand on this question first.

There are pretty much four things that someone might use as proofs. First, the intensity of the pleasure involved; for a feeling is more pleasant when it is more intense, and what happens to all the parts is more intense than what happens to one or a few. Further, that from docked[45] things docked things come to be; for because a part is missing [from the progenitor], no seed, they say, proceeds from there, with the result that the part from which no sperm comes does not come to be. In addition to these, the similarities to the progenitors; for the young look like them not only as regards the body as a whole but also part for part. If indeed, then, the cause of the similarity of the whole is the seed coming from the whole, the cause of the similarity of the parts should be its also coming from each of the parts as well. Further, it would seem reasonable to suppose that just as there is also some primary thing[46] from which the whole comes to be, it is this way too with each of the parts. So if there is a seed for the whole, there should also be a special seed for each of the parts.

And things of this sort are taken as persuasive evidence for these beliefs; for children are born who are like their parents not only in innate characteristics but also in acquired ones; for when the progenitors have had scars, certain of the offspring have been known to have the imprint of the scar in the same places, and there was a case in Chalcedon where the father had a brand on his arm and the letter was marked on the child, though blurred, to be sure, and not clearly articulated.

44. This view is usually referred to as "pangenesis."
45. *Met.* 5.27.
46. I.e., some primary matter. See 729a32–33, 733b26.

It is pretty much on the basis of these considerations above all, then, that some people are persuaded that the seed comes from all [of the body]. **722^{a}1**

1.18
Pangenesis Criticized; What Seed Is; Residues and Colliquescences

On examining the argument, however, the contrary appears more [persuasive]; for to refute the things just stated is not difficult, and in addition the argument involves saying other impossible things. First of all, then, similarity is no sign that the seed comes from all the body, because similarities occur in the voice, the nails, the hair, and even in movement, from which nothing comes. And there are some things that people do not yet have when they generate—for example, a beard or gray hair. Further, children are like their distant ancestors from whom nothing has come; for these likenesses recur after many generations—for example, the woman in Elis who had intercourse with an Ethiopian;[47] for it was not her daughter but her daughter's son who became Ethiopian. And the same argument applies to plants; for it is clear that in their case as well the seed would have to come from all the parts. But many parts are in some cases not possessed, in others may be removed, and in others still they grow on afterward. Further, the seed does not come from the seedcase either, and yet this too is generated having the same shape [as in the parent plant].

Further, does the seed come only from each uniform part (for example, from the flesh, the bone, and the sinew) or also from the non-uniform ones (for example, the face and the hand)? For if only from the former, [we object that] they are like their parents more in the latter (the non-uniform ones, such as the face, the hands, and the feet[48]). If indeed, then, not even similarity in the non-uniforms parts is due to the seed's coming from all the parts, what prevents similarity in the uniform ones from being due not to its coming from all of them either, but to some other cause? And if the seed comes only from the non-uniform parts, it therefore does not come from all the parts. And it is more fitting for it to come from the uniform ones because they are prior and the non-uniform ones are composed of them, and just as likenesses occur in the face and the hands, so they do too in the flesh and the nails. If, however, it comes from both, what would be the mode of generation? For the non-uniform parts are composed from the uniform ones, so that to come from the former would be to come from the latter and from their composition. It is just like if something came from a written name: if it came from all of it, it came from each of the syllables, and, if it came from these, it came from the letters and from their composition. So, if indeed the flesh and the bone are composed of fire and things of that sort, the seed would come rather from the elements; for how could it possibly come from their

47. The woman was white, the man black; their daughter was white, her son black.
48. Retaining τὰ ἀνομοιομερῆ οἷον πρόσωπον καὶ χεῖρας καὶ πόδας.

composition? Without composition, however, there would not be the similarity. If
722ᵇ1 something posterior crafts this, it would be the cause of the similarity, not the seed's coming from all the parts.

Further, if the parts are torn asunder in the seed, how are they alive? On the other hand, if they are connected, they would be a tiny animal.

And what about what belongs to the sex organs? For what comes from the male and what comes from the female are not similar.

Further, if the seed comes from all parts of both progenitors alike, two animals come to be; for it will have every part of each parent. That is why, if indeed one must speak in this way, Empedocles seems to speak most in agreement with this account; for he says that there is a sort of token in the male and in the female, and that the whole offspring comes from neither one, "torn asunder is the nature of the limbs, this part in man's . . .";[49] for otherwise why do the females not generate from themselves, if indeed the seed comes from all the parts and they have a receptacle? But, as it seems, either it does not come from all the body or it does so in the way Empedocles says, not the same thing from each parent—which is why in fact they need to have sexual intercourse with each other. Yet even this is impossible—as impossible, in fact, as it is for the full-grown parts, when torn asunder, to survive and be animate, which is how Empedocles speaks of them as coming to be under the influence of love, "as many heads sprouted without necks"[50]—and later, in this form, growing together. But it is evident that this is impossible; for neither having a soul nor being alive, they would be incapable of surviving—nor, if they were like living animals could several of them grow together so as to be one again. Yet saying that it is this way follows from saying that seed comes from all the body, and just as it was then in the case of the earth under the influence of love, so, on this view, it is in the case of the body. For it is impossible for the parts to come to be [already] connected, that is, come from [the bodies of progenitors] and go off together into one place. Next, how were the upper and lower parts, right and left ones, and front and back ones torn asunder? For all these things are unreasonable.

Further, some parts are distinguished by capacity, others by affections: the non-uniform ones (for example, the tongue and the hand) by their capacity to do something, the uniform ones by hardness and softness and other affections of this sort. It is not in any and every state, then, that a part is blood or flesh. It is clear, therefore, that what has come from them cannot be synonymous with the parts—for example, blood from blood or flesh from flesh. But then if it is from something
723ª1 else that blood comes to be, the cause of the similarity would not be—as those who speak this way say—the coming of seed from all the parts; for it is enough that it come from one part, if indeed it is not from blood that blood comes to be. For why could not all come to be from one? For their account seems to be the same as that of

49. B63 DK.
50. B57 DK.

Anaxagoras, in having none of the uniform things come to be—except that he makes it apply to all things, these thinkers to the generation of animals.

Next, in what sort of way will these parts—the ones that come from all the body—grow? For Anaxagoras reasonably says that [particles of] flesh from the nourishment are added to [particles of] flesh. But if they do not say this, yet say that [seed] comes from all, how, by the addition of something else, will something get bigger, if what is added is not changed? But then if it is admitted that what is added is capable of changing, why not say that from the outset the seed is such that blood and flesh can come to be from it, instead of saying that it itself is blood and flesh? For it certainly is not open to them to say that later growth is due to mixing, like wine when water is poured into it; for each part would have been most of all itself when still unmixed. But as things stand it is rather later on that it is flesh, bone, and each of the other parts. And to say that the some of the seed is sinew and bone is beyond us, as the saying goes.

In addition, if female and male differ during pregnancy, as Empedocles says, seeds "were poured into pure places; some became women when they encountered cold,"[51] then it is evident that just as both women and men change from infertile to fertile, so they also change from female-bearing to male-bearing, which suggests that it is not in the coming from all or not from all that the cause lies, but in the proportion or disproportion between what comes from the woman and what comes from the man, or else it is due to some other cause of this sort. It is clear, therefore, if we assume it to be this way, that[52] the female is not due to the seed's coming from a certain thing, with the result that neither is the part special to the male nor the one special to the female—if indeed the same seed is capable of becoming either female or male, implying that the part is not present in the seed. What difference is there, then, between saying this about this part and saying it about any of the others? For if seed does not come to be even from the uterus, the same argument will apply to the other parts as well.

Further, certain animals come to be neither from those of the same kind nor from those of a different kind—for example, the flies and the kinds called "fleas." And though animals come to be from these, they are no longer ones of a similar nature, but a kind of larvae. It is clear, then, that offspring of a distinct kind do not come to be from every part; for they would be similar to [the progenitors] if indeed similarity were a sign of coming from every part.

Further, from one act of sexual intercourse even some of the animals generate several offspring (and the plants in fact do so always; for it is clear that from one movement these bear all their yearly fruit). And yet how is this possible if the seed were secreted from all the body? For then it is necessary for one secretion to come to be from one act of sexual intercourse and one disaggregation [of seed]. It is not

51. B65 DK.
52. Reading οὕτως, ὅτι.

possible for it to get separated up in the uterus; for by then the separation would be, as it were, from an animal, not from seed.

Further, plant cuttings bear seed from themselves. It is clear, then, that even before they were cut, they bore the fruit from their own magnitude, and not from seed coming from all of the plant.

But a greater proof than these is one we have adequately observed in the case of the insects. For if not in fact in all, yet in most cases, during mating the female extends a part of itself into the male. (That is why in fact they mate, as we said previously,[53] the way they do; for it is evident that the ones below insert something into the ones above, not in all cases, but in most of those observed.) So it is evident, even in those males that emit semen, that the seed's coming from all the body is not the cause of generation, but it occurs in some other way that must be investigated later on.[54] For even if it did indeed happen to come from all the body, as they say, still they should not claim that it comes from everything, but only from what does the crafting—from the carpenter, as it were, but not from the matter. But as things stand, they speak as if it even came from shoes; for it is pretty much the case that a son who is similar to his father wears shoes that are similar to his.

The cause of pleasure's being very intense during sexual intercourse is not that the seed comes from all the body but that there is a strong titillation. That is why if this intercourse happens often, the enjoyment is less for those having sex. Further, the **724ᵃ1** enjoyment is at the end, but [on the view under discussion] it should be in each of the parts, and not at the same time, but earlier in some and later in others.

Docked offspring are come to be from docked progenitors due to the same cause as that due to which they are similar to them. But offspring that are not docked also come to be from docked ones, just as some are not similar to their procreators. We must get a theoretical grasp on the cause of these things later on;[55] for the problem here and there is the same.

Further, if the female does not emit seed, by the same argument the seed does not come from all the body either. And if it does not come from all, there would be nothing unreasonable in its not coming from the female, but for the female to be in some other way a cause of generation. This is the next thing to be investigated, since it is now evident that the seed is not secreted from all the parts.

As starting-point both of this investigation, however, and of the ones that follow, the first thing to grasp about the seed is what it is; for in this way it will be easier to get a better theoretical grasp both on its works and the facts concerning it.

"Seed" means the sort of thing whose nature is to be the first from which what is composed in accord with nature comes to be, not from that thing which is the

53. 721ᵃ9–17.
54. 1.21.
55. 4.3.

progenitor—for example, the human being; for it comes to be from it because the seed belongs to it.[56] But there are many ways in which one thing comes to be from another—for there is a distinct way in which we say night comes to be from day and man from boy, because this one comes after this one. Another is as a statue comes to be from bronze, a bed from wood, and whichever other things come to be as things are said to come to be from matter—from something preexisting having been given a certain configuration the whole thing exists. Another way is as non-musical comes to be from musical, sick from healthy, and, in general, contrary from contrary. Further, beyond these, there is the way Epicharmus produces his climax: from slander abuse, from abuse a fight. In all these cases, the "from something" is the starting-point of movement. And in some cases of this sort the starting-point of movement is within the things themselves as in the case mentioned (for the slander is a part of the entire disturbance), while in some it is external—for example, the crafts [as the starting-points of movement] are outside the things crafted and the torch outside the burning house.

It is evident, however, that the seed is one or other of two ways; for it is either from it as its matter, or from it as the primary mover,[57] that what comes to be has come to be. For it certainly does not do so as this comes after this (for example, from the Panathenaean festival comes the sea voyage[58]), nor as contrary does from contrary; for it is from the passing away of its contrary that the contrary comes to be, and there must be some other subject underlying and remaining present from which it will first come to be. Of the two, then, it is necessary to grasp in which the seed must be put, whether as matter and affected, as form of a sort and affecter, or indeed as both. For at the same time it will perhaps also be clear how generation from contraries belongs to everything that comes to be from seed; for generation from contraries is natural too; for some things come to be from contraries, from male and female, others from one thing only—for example, the plants and certain of the animals in which the male and the female are not distinct and separate.

{What comes away from the progenitor in whatever naturally copulates is called "semen," the first thing containing a starting-point of generation, while seed is what contains the starting-points from both copulators (like the seeds of plants and of certain animals in which male and female are not separated), as the first mixture that comes from female and male, being, as it were, a sort of embryo or an egg; for in fact

56. Reading τούτου.

57. I.e., the proximate mover—the first mover one encounters in proceeding from what is moved.

58. Legend had it that Athens was once obliged to send King Minos of Crete an annual tribute of seven young men and seven maidens to be given to the Minotaur—a monster, half man and half bull, that he kept in a labyrinth. With the help of a thread given to him by Minos' daughter Ariadne, Theseus, a legendary king of Athens, made his way through the labyrinth, killed the Minotaur, and escaped, thus ending the tribute. Each year, Athens commemorated these events by sending a mission of thanks to the sanctuary of Apollo on the sacred island of Delos. This is the sea voyage referred to.

these already contain what comes from both progenitors. Seed and fruit differ by the prior and the posterior; for fruit [is posterior] in that it is from another thing, seed [is prior] in that another comes from it, since both are in fact the same thing. But it must be stated again what the primary nature is of what is called "seed."}[59]

It is necessary for everything that we find in the body to be either a part in accord with nature (and it either non-uniform or uniform) or contrary to nature, like a tumor, a residue, a colliquescence, or nourishment. (By a "residue" I mean a leftover of the nourishment, by a "colliquescence," what has been secreted from a growth-producer by a contrary-to-nature dissolution.)

That it could not be a part is evident; for although it is uniform, nothing is composed of it as of sinew and flesh. Further, neither is it separated, though all the other parts are. But then it is not one of the contrary-to-nature ones either, nor a deformation; for it is present in all and the nature comes to be from it. Nourishment, on the other hand, is manifestly something brought in from outside. So it is necessary for seed to be either a colliquescence or a residue.

The ancients seem to have thought it to be a colliquescence; for saying that it comes from all the body because of the heat from the movement [in copulation] has the force of saying it is a colliquescence. But colliquescences are something contrary to nature, and from things contrary to nature nothing comes to be that is in accord with nature. It is necessary, therefore, for it to be a residue. But now every residue is surely either from useless or from useful nourishment. I call "useless" that from which nothing further is contributed to the nature, while much injury is done by using up too much of it, and "useful," the contrary. That seed could not be the former sort of residue is evident; for those in the worst condition because of time of life or disease have the most of this sort of residue present in them, but the least seed; for either they have none at all or it is not fertile because of being mixed with useless and morbid residue.

The seed, then, is some part of the useful residue. The most useful is the last residue, that is, the one from which each of the parts comes to be from the outset. For there is some residue that is earlier, some later. The one from the first stage of the nourishment is phlegm and anything else of that sort; for even phlegm is a residue of the useful nourishment, a sign of which is that when mixed with pure nourishment it is nourishing and is used up in cases of disease. But the last residue from a large quantity of nourishment is extremely small. One must understand, however, that animals and plants grow day by day [only] a little; for if [even] a very small quantity of the same material were added, the thing's size would become excessive.

We must, therefore, say the contrary of what the ancients said. For they said that the seed is what comes from all the body, but we say that it is what naturally goes to all of it, and while they thought it a colliquescence, it is evident that it is a residue instead. For it is more reasonable for the last thing going there to be similar to what is

59. The status and position of this passage are uncertain.

left over from it, as painters often have flesh-colored pigment left over that is similar to what they used up. But everything that undergoes colliquescence is destroyed and departs from its nature.

A proof that seed is not a colliquescence, but rather a residue, is that large animals have few young, while small ones are prolific. For it is necessary for there to be more colliquescence in large animals, but less residue; for since the body is large most of the nourishment is used up for it so that little residue occurs.

Further, no place is assigned to a colliquescence in accord with nature; rather, it flows wherever there is an easy route in the body, while to all the residues a place in accord with nature is assigned—for example, that of the dry nourishment is the lower stomach, that of the liquid nourishment is the bladder, that of the useful one is the upper stomach, and of the spermatic residues the places are the uterus, the sex organs, and the breasts; for it is into these that it is gathered and flows together.

The things resulting from it are also evidence that seed is what we have said it is. These result because the nature of the residue is the sort it is. The exhaustion that occurs from the smallest departure of seed is noticeable, suggesting that bodies are being deprived of the final thing to come from the nourishment. (A few individuals, it is true, for a short time, in accord with the time of life, obtain relief through its departure when it is excessive in quantity, just as with the first nourishment if it is excessive in quantity; for on its emission too the body thrives more.) Further, this results when other residues depart with it; for what departs is not seed alone, but rather other capacities that are mixed with it also depart along with it in these cases, and these are morbid ones. That is why in certain cases at least what departs is in fact infertile due to its containing little of what is spermatic. But speaking of most cases and for the most part, the result of acts of sexual intercourse is exhaustion and incapacity [rather than relief], due to the causes just stated.

Further, no seed is present either in the first time of life, in old age, or in illnesses—in sickness because of incapacity, in old age because the nature does not concoct enough of it, in childhood because, due to growing, all is used up beforehand; for in pretty much five years, in the case of the human beings, at any rate, the body seems to gain half of the total size that it comes to have in all the rest of its lifetime.

In many animals and plants, however, a difference results in this regard both between one kind in relation to another kind and, within the same kind, between things of the same form in relation to each other—for example, human being in relation to human being, or vine in relation to vine. For some have abundant seed, some have little seed, and others no seed at all—not because of weakness but, in some cases, at any rate, because of the contrary; for it is all used up on the body, as in the case of some human beings; for being in good condition and becoming very fleshy and rather too fat they emit less seed and have less appetite for sexual intercourse. A similar thing is the affection having to do with "goatish" vines, the ones that because of their nourishment become rampant (since goats also mate less when they are fat, which is why in fact they thin them down before [the mating season], the vines are

called "goatish" after the affection of the goats). And fat people, women as well as men, appear to be less fertile than those who are not fat, because the residue when concocted in well-fed bodies becomes fat; for fat too is a healthy residue caused by abundant feeding.

Some bear no seed at all—for example, the willow and the poplar.[60] This affection too has both sorts of cause.[61] For in fact, due to incapacity, they do not concoct [their nourishment] and, due to capacity, they use it up, as was said.[62] Similarly, both being prolific and having abundant seed are due in some cases to capacity and in others to incapacity. For much useless residue is mixed together with it, so that some even become ill when there is no easy route for its evacuation with this.[63] And though some regain their health, others actually die. For they [the useless residues] get dissolved in it [the seed] as also in the urine; for this is also an ailment that has been known to befall some people.

Further, the duct is the same for the residue and for the seed. And in those in which both the liquid and the dry [residues from] nourishment occur, the duct for the liquid one is the very same as the one for the secretion of the semen (for it is a residue of the liquid; for the nourishment for all things is more wet), but in those that do not have a liquid residue the secretion of the semen is by the way of the dry sediment.[64]

Further, a colliquescence is always morbid, while the subtraction of a residue is beneficial. But the emission of seed plays a double game because it takes with it some of the nourishment that is not useful. If it were a colliquescence, however, it would always cause harm. But as things stand it does not do this.

That the seed, then, is a residue of the useful nourishment, that is, the last stage of the nourishment, whether emitted by all or not, is evident from what was said.

1.19

Semen as a Residue of Nourishment and Blood; Menses as a Residue

After these issues we must determine of what sort of nourishment the seed is a residue, and of what sort the menses; for menses occur in some of the live-bearing animals. For through this means it will also be evident whether the female emits seed like the male and what comes to be is a mixture of two seeds, or whether no seed is secreted from the female; and if no seed, whether she contributes nothing else at all

60. A false view, explaining why the trees are connected with the dead (e.g., Homer, *Odyssey* 10.510).

64. The dry residue.

to generation but only provides a place, or does contribute something, and if so how and in what way.

That blood is the last stage of the nourishment in blooded animals, and its analog in bloodless ones, was said previously.[65] And since semen too is a residue of nourishment, that is, from its last stage, it will be either blood, its analog, or something composed of these. And since each of the parts comes to be from blood as it is being concocted and somehow divided into parts, and since the seed (although quite distinct from blood when, having been concocted, it is secreted), when unconcocted and when forced out by too frequent indulgence in sexual intercourse, is sometimes still bloodlike when it has emerged, it is evident that the seed must be a residue of bloodlike nourishment, the one that is finally distributed to the parts. And because of this it has great capacity (and in fact the emission of the pure and healthy blood is cause of exhaustion) and that offspring should be like their parents is reasonable; for what has gone to the parts is like what is left over. So the seed of the hand, the face, or the whole animal is in an undifferentiated way a hand, a face, or a whole animal—that is, as each of the latter is actually, such the seed is potentially, either in virtue of its own mass or in virtue of having a certain capacity within it (for it is not yet clear from these determinations whether the body of the seed is the cause of generation, or whether it contains a certain state and starting-point of movement that is capable of generation); for neither the hand nor any other part at all, without being soul-involving or having a certain other capacity, is a hand or any other part whatever except homonymously.[66]

{It is also evident that in cases where a colliquescence occurs that is spermatic, it too is a residue. This happens when it is resolved into what went before, just as when a fresh coat of plaster falls off immediately (for what comes away is the same as what was first applied). Similarly, the final residue is the same as the first colliquescence.}[67] And let these things be determined in this way.

Since, however, it is necessary for a more abundant and less concocted residue to occur in what is weaker, and [seed] being of this sort, it is necessary for it to be a quantity of bloodlike liquid, and since the weaker is what has a lesser share of heat in accord with nature, and the female is of this sort, as was said previously,[68] it is necessary for the bloody secretion that occurs in the female to be a residue as well. And the so-called menstrual secretion is of this sort.

That menses are a residue, therefore, and that they are the analog in females of semen in males, is evident. The results associated with it are signs that this statement is correct. For at the same time of life semen starts to appear in the males and be secreted and menses to be emitted in the females, and the voice changes and the

67. This should be read after 726ᵃ25.
68. *PA* 648ᵃ12.

breasts give signs of appearing. Also, at the time of life's declining the capacity to generate ceases in the one and the menses cease in the other.

Further, there are also the following signs that this secretion in the females is a residue. For, for the most part, neither hemorrhoids, nosebleeds, nor anything else [of the sort] occurs in women unless the menses are ceasing, and if something of this sort does occur, the menstrual purgations become more difficult, suggesting that the secretion is being diverted to it.

Further, the females do have blood vessels that are as large as the males', and are more hairless and smoother, because the residue that goes to these is secreted along with the menses. And this same thing must be considered as the cause of the body masses of the females being smaller than those of the males among the live-bearing animals; for it is only in these that the menses flow out externally. And among these it is most noticeable in women; for woman emits more secretion than other animals. That is why she is always noticeably pale and without conspicuous blood vessels, and has an evident deficiency of body as compared with the males.

Since this is what occurs in the females as semen does in the males, and since it is not possible for two spermatic secretions to occur at once, it is evident that the female does not contribute seed[69] to generation. For if there were seed, there would be no menses. But as things stand, because the menses occur, there is no seed.

Why, then, just as the seed is a residue so too are the menses has now been stated. As evidence of this one may take what some of the resulting facts are for the animals. For fat animals are less generative than non-fat ones, as was said previously.[70] (The cause is that the fat too is a residue just as seed is, namely, concocted blood, but not concocted in the same way as seed is. So it is reasonable that when the residue has been used up to make fat what has to do with the semen is deficient.) And among the bloodless animals, the soft-bodied and soft-shelled animals are at their best around the time of pregnancy; for because they are bloodless and no fat occurs in them, what is analogous to fat in them is secreted to make the spermatic residue.

A sign that the female does not emit the sort of seed that the male does, and that generation is not due to the mixing of both, as some people say, is that often the female conceives without the pleasure in sexual intercourse occurring in her; and, again, when pleasure occurs no less [in her], and that, even though the male and the female keep an equal pace,[71] nothing comes to be unless the wet secretion of the so-called menses is present in proportion. That is why the female does not generate either when the menses are wholly absent or, for the most part, when they are present but being exuded, but rather after the purgation. For, at the one time, the capacity coming from the male and present in his semen has no nourishment or matter from which to compose the animal, while at the other time, the semen gets washed out

69. I.e., pure seed (728[a]26–27) or semen (729[a]22), since the menses are themselves seed (728[a]26), as are eggs (718[b]15).
70. 725[b]32–34.
71. *HA* 636[b]14–24.

because of the quantity of menses. But when the menses have occurred and have departed, what remains is composed [into an embryo]. And if the females conceive when the menses are not occurring, or during their occurrence but not later, the cause is that in the former case as much wet secretion occurs as remains after purgation in the fertile ones, but no excess liquid occurs to depart externally, while in the latter case the mouth of the uterus closes after the purgation. When, then, what departs is plentiful but the purgation is still taking place, although not enough to wash out the seed, that is when they conceive if they have sex. And there is nothing strange in the fact that it should continue after conception; for in fact the menses even recur afterward up to a point, but in small quantity and not throughout [pregnancy]. This, though, is a morbid condition, which is why it occurs in few females and infrequently. It is what occurs for the most part that is most in accord with nature.

That what the female contributes to generation is the matter, then, that this lies in the composition of the menses, and that the menses are a residue, is clear.

1.20
Menses as Impure Seed

The seed that some people think is contributed by the female during sexual intercourse, because an enjoyment much the same as that of the males sometimes occurs in females at the same time as a liquid secretion, this liquidness is not the spermatic one, but is special to the place in particular females.[72] For it is a secretion from the uterus and occurs in some but not in others; for it occurs in the pale-skinned and womanly, speaking for the most part, not in the dark and masculine-looking. Its quantity, when it occurs, is sometimes not in accord with that of the seed emitted, but far exceeds it. Further, one foodstuff's distinctness from another makes a great difference to whether less or more of this sort of secretion occurs—for example, some of the bitter ones make a noticeable difference to the quantity of the secretion.

The occurrence of pleasure in sexual intercourse is due to the emission not only of seed but also of breath, from the composition of which the emission of seed results. This is clear in the case of boys who are not yet capable of its emission but are near the age for it, and in infertile men; for, in all these, pleasure is produced by friction. And in those who have lost the capacity to generate, the bowel is sometimes loose because of the residue secreted into the bowel that is incapable of being concocted and becoming seed.

A boy too is like a woman in shape, and a woman is like an infertile man; for the female exists due to a certain incapacity, namely, due to being incapable of concocting seed from the nourishment in its last stage (which is either blood or its analog

72. The liquid may be vaginal mucus and the "sweating" produced during sexual arousal and vasocongestion.

in bloodless animals) because of the coldness of her nature. Just as in the bowel non-concoction produces diarrhea, then, so in the blood vessels it produces various hemorrhages, in particular the menses; for they too are a hemorrhage, but while the others are due to disease, this one is natural.

Evidently, then, it is reasonable that generation occurs from this. For the menses are seed that is not pure but needs work, just as in what has to do with the generation of wheat, when it has not yet been sifted, though the nourishment is present in it, but work is needed for their purgation. That is why, when the former is mixed with the semen and the latter with pure nourishment, the one generates and the other nourishes.

A sign that the female does not emit seed is that the pleasure in sexual intercourse is produced by touch in the same place as in males. And yet they do not emit this wet secretion from there.

Further, this secretion does not occur in all females, but in those that are quite sanguineous, and not even in all of them, but in those that do not have the uterus by the diaphragm and are not egg-laying. Further, nor does it occur in those that have not blood but its analog; for the precise thing that is blood in the former is a distinct aggregation in the latter. The cause due to which the purgation occurs neither in them nor in certain blooded animals, except the ones mentioned (those whose uterus is down below and are not egg-laying),[73] is the dryness of their bodies, which leaves little residue over, enough only for generation but not for external emission. But in all the ones that are live-bearing without first laying an egg—these are the human being and those four-footed animals that bend the hind leg inward (for all these are live-bearing without first laying an egg)—menses occur, unless they are deformed in the process of generation like the mule, but the purgation is not conspicuous as it is in the human beings. But how this occurs in each of the animals is described with exactness in the *History of Animals*.[74]

Among the animals, the greatest quantity of purgation occurs in women, and in men the emission of seed is greatest in proportion to their size. The cause is the composition of their body, which is wet and hot; for in the ones of this sort it is necessary for the greatest quantity of residue to occur. Further, they do not have the sort of parts in their body to which residue is diverted, as the others do; for they do not have a great quantity of hair on their body, nor excretions for bones, horns, and tusks.

Here is a sign that the seed is in the menses: at the same time of life, as was said previously,[75] this residue occurs in the males and the females show signs of menses, suggesting that the places receptive of the residue in each of the two become distinct at the same time, and as the neighboring places are made porous, a growth of pubic hair bursts forth. And when they are about to be distinct, the places get swelled up

73. Reading τισὶ πλὴν τοῖς εἰρημένοις, τοῖς κάτω ἔχουσι καὶ μὴ ᾠοτοκοῦσιν.
74. *HA* 521[a]21–31, 572[b]29–573[a]16, 574[a]31–[b]6, 581[b]1–11, 582[a]34–583[a]12 (but only some cases are described in these passages).
75. 727[a]5–10.

by the breath, more noticeably around the testicles in males, though it shows signs around the breasts as well, and in females more around the breasts; for when these are two fingers high, it is then that the menses occur in most females.

In those living things in which male and female are not separated, the seed is, as it were, an embryo. By an "embryo" I mean the primary mixture of female and male. That is also why one body comes from one seed—for example, one stalk from one grain of wheat, just like one animal from one egg (for twin eggs are two eggs). But in all kinds in which female and male are distinct, it is possible for several animals to come from one seed, suggesting that the seed in plants and that in animals are different in nature. There is a sign of this, for several young come from one mating in animals capable of generating more than one. It is also clear from this that the semen does not come from every part [of the body]; for separate [parts of it] would not from the outset be secreted by the same part [of the body], nor would they, having arrived there together, become separate in the uterus. Instead, it happens as is reasonable, since the male provides both the form and the starting-point of movement, while the female provides the body, that is, the matter. Like in the curdling of milk, where the body is the milk, and the fig juice or rennet is what contains the starting-point that provides the composition, so is what comes from the male when it is partitioned in the female. But due to what cause it is partitioned here into a larger number, here into fewer, and here not partitioned at all, will be for another account.[76] But because there is no difference in the form, at any rate, but only the proportion between what is divided and the matter, and neither so little that it does not concoct or compose the matter nor so much that it dries it up, it generates in this way many offspring. But from the primary thing doing the composing, from [what is] already one, only one offspring comes to be.

That the female does not contribute semen to the generation, then, but does contribute something, what the menses is composed of (or its analog in bloodless animals), is both clear from what was said and is in accord with the account based on universal investigations.[77] For it is necessary for there to be a progenitor and a from which. And, even if these are one, it is necessary for them to differ, at any rate, in form, and for the accounts of them to be distinct. And in those that have these capacities separated, it is necessary for both the bodies and the nature of the affecting one and the affected one to be distinct. If, then, the male exists as mover and affecter, and the female, insofar as it is female,[78] as capable of being affected, the female's contribution to the male's semen would be not semen but matter. And it is evident that this is precisely what happens; for the nature of the menses corresponds to the primary matter.

76. 771^{b}14–772^{b}12.

77. I.e., into coming to be generally, not just animal coming to be.

78. Reading ἢ θῆλυ.

1.21
How Male Seed Is a Cause of What Comes to Be

As regards these things, let them be determined in this way. At the same time, the answer to the next question to be investigated is evident from these considerations: **729ᵇ1** how it is that the male contributes to generation, and how it is that the seed from the male is a cause of what comes to be. Is it by being present in, and from the outset being a part of, the body of what comes to be, mixing with the matter provided by the female? Or does the body of the seed not have a share, but only the capacity and movement in it? For it is the latter that is the affecter, while what is composed and takes the shape is what remains of the residue in the female. This is evident both in accord with the account and with the facts.

For if we investigate the question in universal terms, it is evident that whenever one thing comes to be from an affected and an affecter, it is not by way of the affecter being present within what comes to be, nor, in general, is it so when one thing moves something and another is moved. But now the female, insofar as female, is a thing capable of being affected, while the male, insofar as male, is a thing capable of affecting and from which comes the starting-point of the movement. So, if we take the extremes of each, in which case the one is capable of affecting and moving something, the other capable of being affected and being moved, it is not from these that the one thing comes to be, except in the way in which the bed does from the carpenter and the wood, or the sphere from the wax and the form. It is clear, therefore, that it is not necessary for something to come away from the male, nor, if something does come away, is it necessary because of this for what comes to be to do so from that something by way of its presence within, but only by way of being mover and form, in the way that the cured person is also due to the craft of medicine.

And what happens in agreement with the account is also in agreement with the facts. For that is why some males, even though they copulate with the females, do not, it appears, insert any part into the female, but on the contrary the female inserts one into the male, as in the case of certain insects. For in those that do insert one, the effect that the seed produces in the female is produced in these insects by the heat and the capacity in the [male] animal itself, when the female brings into it the part that is receptive of the residue. And because of this these sorts of animals remain intertwined a long time, but when untwined generate quickly. For they copulate until [the capacity in the male] has composed [the matter in the female] in the way semen does. But after untwining they quickly emit the embryo; for they generate an incomplete thing; for all [animals] of this sort give birth to larvae.

But what happens in the birds and in the fishes of the egg-laying kind is the greatest sign that the seed does not come from all parts and that the male does not **730ª1** emit any part of the sort that will remain present in what comes to be, but generates

an animal only by the capacity in the semen, as we said[79] of insects in which the female inserts [a part] into the male. For if a hen happens to be conceiving wind-eggs and is then mated before the egg has changed from being wholly yellow to turning white, the eggs become fertile instead of wind-eggs; and if it is mated with a second cock while the egg is still yellow, the kind of all the chicks turns out to be in accord to the cock that mated it last. That is why some people who are serious about well-bred birds do things in this way, changing [the cocks] for the first and second matings, on the supposition that the seed is not mixed together with [the egg] and present within it, and that it did not come from all parts; for it would then have come from both cocks, so that the same parts would be possessed twice. Instead, by its capacity, the male seed establishes a certain state in the matter and nourishment that is in the female. For it is possible for the seed that came in second to do this by heating and concocting; for the egg gets nourishment as long as it is growing.

The same happens too in the generation of the egg-laying fishes. For when the female has laid the eggs, the male sprinkles the seminal fluid over them, and those eggs it reaches become fertile, while those it does not reach are infertile, suggesting that the male's contribution to the animals is not quantitative but qualitative.

That the seed, then, does not come from all [parts] in those that emit seed, and that the female does not contribute in the same way as the male to the generation of the offspring that are composed, but instead the male contributes a starting-point of movement and the female the matter, is clear from what has just been said. That is why, in fact, the female does not generate by itself; for it needs a starting-point, that is, something that will cause movement and give definition (although in some animals certainly, such as hens, their nature is capable of generating up to a point; for these do compose something, but the things they compose are incomplete, the so-called wind-eggs).

1.22
How the Male Contributes to Generation

It is also why the generation of what comes to be takes place in the female, although it is not into the male that either the male itself or the female emits semen, but rather both contribute to the female what comes to be from them, because the matter is in the female from which what is crafted comes. And it is necessary for some to be present from the outset, gathered together, from which the embryo is composed in the first instance, while other matter must continually be added in order that the embryo may grow. So it is necessary for giving birth to take place in the female; for the carpenter too is in close contact with the wood, the potter with the clay, and, in

79. $729^{b}26–28$.

general, every work on a thing and every last movement takes place in contact with the matter—for example, building takes place in what is being built.[80]

One may grasp from these cases how the male too contributes to generation; for not every male emits seed, and in the case of those males that do emit it, it is no part of the embryo that comes to be, just as nothing comes away from the carpenter to the matter of the pieces of wood he works on, nor is there any part of the craft of carpentry in what is being produced, but the shape—that is, the form—comes to be from the carpenter by means of the movement in the matter, that is, his soul, in which the form is present, and his scientific knowledge move his hands or some other part with a certain sort of movement—distinct when what comes to be from it is distinct, the same when what comes to be from it is the same—and the hands move the instruments, and the instruments move the matter. Similarly, the nature present in the male, in those that emit seed, uses the seed as an instrument and as possessing active movement, just as in craft productions the tools are in movement; for the movement of the craft is in a way in them.

Those, then, that emit seed contribute in this way to generation. But those that do not emit it, where the female inserts some part of itself into the male, do so like someone bringing the matter to the craftsman. For because of the weakness of these sorts of males, their nature is not capable of producing by other means, but even when it persists the movements have scarcely enough strength, and produce like modelers, not carpenters; for it is not by means of touching something else that it crafts what is being composed, but it does so itself by using its own parts.

1.23
Plant Reproduction

In all animals that move by walking the female is separated from the male, one animal being female and another male, though they are the same in form—for example, both human or both horse. In plants, on the other hand, these capacities are mixed and the female is not separated from the male. That is why in fact they generate from themselves and emit not semen but an embryo, which we call "seed." And this is well said by Empedocles in his poem: "Thus tall trees lay eggs, first the olive trees";[81] for the egg is an embryo, and from a certain part of it the animal comes to be, while the remainder is nourishment. And from part of the seed the growing plant comes to be, while the remainder becomes nourishment for the shoot and for the first root.

In a certain way the same thing happens too in those animals that have the female and the male separated. For when there is need for them to generate, they become inseparable, as in plants, and their nature tends to become one. This is precisely what

80. *Met.* 1050ᵃ28–34.
81. B79 DK.

is evident to the eye when they mix together and copulate, one animal coming to be from both.[82]

And for those that do not emit seed it is natural to remain intertwined for a long time until [the male] has composed the embryo—for example, the insects that copulate. But others so remain only until the male has emitted some part of what he introduces that will compose the embryo in a longer time—as, for example, in the case of the blooded animals. For the former keep together for some part of a day, while in the latter the semen takes several days to compose the fetus, though they let go when such a thing has been released. And animals are just like divided plants, as if, when they bear seed, one were to untwine and separate them into the female and male present within them.

And nature crafts all this in a reasonable way. For of the substance of plants there is no other work or action at all except the generation of seed, so that since this occurs through the copulation of the female and the male, nature has mixed these and arranged them together with each other. But these things have been investigated elsewhere.[83] The work of the animal, on the other hand, is not only to generate (for this is common to all living things), but also they all participate in a sort of knowledge, some in more, some in less, some in altogether little. For they have perception, and perception is a sort of knowledge. And its esteem or lack of esteem differs greatly as we look at it in relation to practical wisdom and in relation to things of the inanimate kind. For in comparison to being practically wise, participating only in touch and taste seems like nothing at all, but in comparison to plant or stone it **731^{b}1** seems a wondrous thing; for it seems that one would be content with even this share of knowledge, rather than lying dead and not being. It is by perception that animals differ from things that are merely living. But since it is necessary for it also to live, if it is an animal, when there is a need for it to accomplish the work of a living thing, it then copulates, mixes, and becomes like a plant, as we said.[84]

Among the animals, the hard-shelled animals are intermediate between the animals and the plants, and, as being in both, do the work of neither; for, as a plant, they do not have the female and the male, and do not generate in another, while, as an animal, they do not bear fruit from themselves as plants do, but are composed and come to be from a certain earthen and wet material. But their generation must be spoken about later.[85]

BOOK 2

2.1
Sexual Dimorphism; Classification of Animals in Terms of Generation; Preformationism and Epigenesis

That the female and the male are starting-points of generation was said previously,[86] as was what their capacity is and the account of their substance. As for why the one becomes and is female and the other male, how it is so in virtue of necessity, of the first mover, and of a certain sort of matter, our account must try to explain as it proceeds, but how this is so because of the better and the cause-for-the-sake-of-which belongs to [the account of] a higher starting-point.

For since some beings are eternal and divine, while others admit of both being and not being, and since the good and the divine is always, in accord with its own nature, a cause of the better in the things that admit of it, while the non-eternal does admit of being and not being and of partaking in both the worse and the better, and since the soul is better than the body, and the animate than the inanimate because of the soul, and being than not being, and living than not living—due to these causes there is generation of animals; for since it is impossible for the nature of this sort of kind to be eternal, what comes into being is eternal in the [only] way that is possible for it. In number, of course, it is not possible (for the substance of the beings is in the particular one), but if indeed it were so, it would be eternal; in form, however, it is possible. That is why there is always human kind, animal kind, and plant kind.

732ᵃ1 Since the starting-point of these is the female and the male, it would be for the sake of generation that the female and the male exist among the beings.[87] But since the first cause of movement—in which belongs the account and the form—is better and more divine than the matter, it is also better that the more excellent be separated from the worse. That is why, in those in which it is possible and as far as it is possible, the male is separated from the female; for the starting-point of the movement, what the male stands for in what comes to be, is better and more divine—while the female is matter. The male, however, comes together and mixes with the female for the work of generation; for this is common to both.

Something lives, then, in virtue of participating in the male and the female (which is why even plants participate in life), but the animal kind is [what it is] in virtue of perception. And in pretty much all of those that move by walking, the female and the male are separated due to the causes stated; and some of these, as was said,[88] emit seed in copulation, while others do not. The cause of this is that the more estimable

86. 1.1–2.
87. Reading οὖσιν.
88. 721ᵃ30–ᵇ6.

animals are also more self-sufficient in their nature, so that they have greater size. But this cannot be had without soul-involving heat; for it is necessary for what has a greater size to be moved by a greater capacity, and the heat is something capable of causing movement. That is why, taking a general view, we may say that the blooded animals are larger than the bloodless ones, and those that move by walking larger than the stationary ones. And these are precisely the ones that emit seed because of their heat and size.

The cause due to which each of the two, the male and the female, exists has now been stated.

Among the animals, some complete and send forth externally an offspring similar to themselves—for example, those that are externally live-bearing. Others bring forth something unarticulated that has not yet acquired its own shape. Among the latter sort, the blooded ones lay eggs, while the bloodless ones generate larvae. An egg is different from a larva; for an egg is that from a part of which what comes to be comes to be (the remainder being nourishment for what comes to be), while a larva is that from the whole of which the whole of what comes to be comes to be.

Among the live-bearing animals that bring to light a complete offspring similar to themselves, some are internally live-bearing from the outset (for example, the human being, the horse, the cow, and—of the sea creatures—the dolphin, and the others of this sort). Others are at first internally egg-laying, then externally live-bearing (for example, the ones called "selachians").

Among the egg-laying animals, some release complete eggs—for example, the birds, the egg-laying four-footed animals, and the footless animals—for example, the lizards, the turtles, and most of the snake kind (for the eggs of these, when they have come out, do not take on growth). Others lay incomplete eggs—for example, the fishes, the soft-shelled animals, and the so-called soft-bodied animals; their eggs do grow in size once they come out.

All the live-bearing[89] animals are blooded, and the blooded ones that are not wholly infertile are either live-bearing or egg-laying. Among the bloodless ones, the insects give birth to larvae, whether they come to be from copulation or copulate themselves. For there are some insects of this sort, which, though they come to be spontaneously, are yet female and male, and from their copulation something comes to be, even though it is incomplete. The cause of this was stated previously elsewhere.[90]

Much overlapping of genera, however, occurs; for the two-footed animals are not all live-bearing (for the birds are egg-laying) nor all egg-laying (for the human being is live-bearing); nor are the four-footed animals all egg-laying (for the horse, the cow, and countless others are live-bearing) or all live-bearing (for the lizards, the crocodiles, and a large number of others are egg-laying). Nor does the having or not having of feet differentiate them; for there are also live-bearing footless animals (for

89. Secluding ἢ ᾠοτοκοῦντα.

90. A promise unfulfilled in the extant treatises.

example, the vipers and the selachians) and egg-laying ones (for example, the fish kind and the other snake kinds); and of the ones having feet many are egg-laying, many live-bearing (for example, the four-footed animals mentioned); and the internally live-bearing include both ones that have feet[91] (for example, the human being) and footless ones (for example, the whale and the dolphin). There is no dividing, then, in this way, nor is any of instruments for movement by walking the cause of this difference. Instead, the live-bearing ones are the animals that are more complete in nature and participate in a purer starting-point; for nothing is internally live-bearing if it does not take in breath and inhale. And the more complete ones are those that are hotter in nature and wetter and not earthen. And the defining mark of natural heat is [the presence of] the lung, when it is [well] blooded; for, in general, the ones that have a lung are hotter than those that do not, and of the former, the ones whose lung is not spongy nor firm nor poorly blooded, but rather [well] blooded and soft. And **733a1** just as the animal is complete, while the egg and the larva are incomplete, so what is complete naturally comes to be from what is complete.

The ones that are hotter due to having a lung, but drier in their nature, or are colder but wetter, either lay a complete egg or first lay an egg and then are live-bearing internally. For the birds and the hard-scaled animals, because of their heat, generate a complete thing, but because of their dryness they lay an egg [only]—the selachians are less hot than these, but wetter, so that they participate in both; for they are both egg-laying and internally live-bearing; they are egg-laying because they are cold, live-bearing because they are wet; for the wet is characteristic of life, while the dry is farthest from the animate. And since they are neither feathered, hard-scaled, nor soft-scaled (which are signs rather of a dry and earthen nature), the egg they generate is soft; for the earthen material does not rise to the surface in the egg any more than in themselves. And that is why they lay their eggs internally; for if it were to go outside, the egg, not having any protection, would be destroyed.

The animals that are rather cold and dry also lay eggs, but the egg is incomplete, and is hard-skinned because they are earthen, and because it is incomplete when emitted, in order that it be preserved it has a shelly protection to safeguard it. The fishes, then, being soft-scaled, and the soft-shelled animals, being earthen, generate hard-skinned eggs.

The soft-bodied animals, as themselves having bodies that are viscous in nature, preserve in the same way the incomplete eggs they emit; for they emit a large amount of very viscous material around the embryo.

The insects all give birth to larvae. On the other hand, all insects are bloodless, which is why in fact they give birth to larvae externally. But the bloodless animals do not all give birth to larvae, unconditionally speaking; for the insects, the ones that give birth to larvae and the layers of incomplete eggs (for example, the soft-scaled fishes, the soft-shelled animals, and the soft-bodied animals) overlap each other. For

91. Reading πόδας ἔχοντα.

the eggs of the latter are larva-like (for they take on growth externally), while the larvae of the former become egg-like after being emitted. The way they do so we will determine later on.[92]

We must understand how well and successively nature renders generation. For the more complete and hotter animals render their young complete with respect to **733ᵇ1** quality (though with respect to quantity no animal at all does so; for all, after they have come to be, take on growth), and these are the ones, of course, that generate animals internally from the outset. Those that come second do not generate complete ones internally from the outset (for they are live-bearing after first laying eggs), but it is externally that they are live-bearing. Others [coming third] generate not a complete animal but an egg, and this egg is complete. The next [coming fourth], having a nature yet colder than these, generate an egg—not, however, a complete egg, but one that is completed externally, as with the soft-scaled fish kind, the soft-shelled animals, and the soft-bodied animals. The fifth and coldest kind does not even lay eggs from itself, instead, this sort of affection happens externally, as was said;[93] for the insects give birth to larvae at first, and after being emitted, the larva becomes egg-like (for the so-called chrysalis has the capacity of an egg), then from this an animal comes to be, reaching in this third change the end of its generation.[94]

There are, then, some animals that do not come to be from seed, as was said previously.[95] All the blooded ones, however, come to be from seed, when they come to be from copulation, the male emitting semen into the female, on the entering of which the animal is composed and takes on its proper shape, some within the animals themselves when they are live-bearing, others in eggs, {. . .}[96] seeds, and other such secretions.

About these things there is a large puzzle as to how the plant, or any animal, comes to be from the seed. For it is necessary for what comes to be to come to be from something, to be due to something, and to be something. That from which is the matter. Some animals have their primary matter within themselves, having got it from the female—for example, those that come to be not as a live-born offspring but as a larva or egg. Others get it from the female for a long time through being suckled, as do those that come to be as live-born offspring not only externally but also internally. That from which a thing comes to be, then, is the matter of this sort.

But what is now being sought is not from what the parts come to be, but rather due to what; for either something external generates them, or something present in the semen and the seed, and is either some part of soul, or soul, or something that would have soul. For something external to generate each of the viscera or other **734ª1**

92. 3.9.
93. 733ª30.
94. We count two changes, from larva to egg, from egg to animal. The Greeks count the first as well as the last member of the series—larva, egg, animal.

96. There is a lacuna in the text at this point.

parts would seem unreasonable; for it is impossible for something to move a thing without making contact with it, or, without that something moving it, for the thing to be affected by it. In the embryo itself, therefore, something [of the relevant sort] is already present, either as a part of it or separated from it. But for it to be some other separated thing is unreasonable; for after the animal has come to be, does this thing pass away or does it remain? But nothing of this sort appears to be in it, nothing that is not a part of the whole plant or animal. But then again for it to pass away after having generated either all of the parts or some of them is absurd; for if it makes [only] some, what will make the rest? For if it makes the heart and then passes away, and the heart another part, by the same argument either all pass away or all remain. Therefore, it is preserved. Therefore, it is a part that is present in the seed from the outset. If, then, there is no part of the soul that is not in some part of the body, it would also be a part that is animate from the outset.

How, then, does it generate the other parts? For either all the parts—heart, lung, liver, eye, and each of the others—come to be simultaneously, or successively, as is said in the so-called Orphic poems; for there the author says that an animal comes to be like the weaving of a fishing net. That it is not simultaneously is evident even to perception; for some of the parts are already noticeably present [in the embryo], others not. And that this is not because they are too small to be visible is clear; for the lung is larger than the heart but is noticeable later in the initial stage of generation. Since, then, one is earlier and another later, does the one generate the other, and is the latter due to the contiguous one, or rather does this come to be [only] after that? I mean, for example, not that the heart, when it has come to be, generates the liver, and it something else, but that this is after that, as after a child a man comes to be but not due to it. The reason for this is that, in the things that come to be by nature or by craft, what is potentially such-and-such comes to be due to what is actually such-and-such, so that the form and shape [of the later thing] would need to be in the earlier thing—for example, the form of the liver in the heart. And in other ways too, the account is an absurd fabrication.

But then for any part of the animal or plant that comes to be to be present in the seed from the outset—whether it has the capacity to generate the other parts or not—is also impossible if all come to be from seed and semen. For it is clear that it is due to what produced the seed that it came to be, if indeed it is present in it from the
734b1 outset. But seed must come to be beforehand, and this is the work of its progenitor. Therefore, no part can be present in it. Therefore, the seed does not contain within itself, either, what generates the parts. But then neither can this be external. But it is necessary for it to be one or other of these two.

We must try, then, to resolve this [puzzle]; for perhaps something of what was said is not simple—for example, in what way exactly it is not possible for the generation of the parts to be due to something external. For there is a way in which it is possible, and another way in which it is not. Whether we speak of the seed, or of what the seed comes from, makes no difference, insofar as the seed has within it

the movement with which that other moved it. And it is possible for this to have moved that, and that this other, and for it to be like those wondrous automata. For their parts somehow contain a capacity when at rest, and when something external has moved the first of them, immediately the contiguous one becomes active. As, then, in the case of these automata the external thing is in a certain way moving them, not by making contact with any part now, but by having made contact with one, it is likewise in the case of what the seed came from, or what generated the seed, it moves by having once made contact, not by making contact still. In another way, however, it is the internal movement that does this, as [the process of] building does the house.

That there is, then, something that generates [the parts], though it does not do so as a this something nor as something present in it as an already completed thing, is clear.

But we must grasp how each part comes to be there, first positing as a starting-point that whatever comes to be by nature or by craft comes to be due to something actively being, from something potentially being, of the relevant sort. The seed, then, is of such a sort, and contains a movement and a starting-point of such a sort, that as the movement ceases each part comes to be and comes to be animate. For it is not a face without having soul, nor is it flesh; rather, when they have passed away, the one will be homonymously said to be a face and the other flesh, just as it would be if they were made of stone or wood. And the uniform parts come to be at the same time as the instrumental ones. And just as we would not say of an axe or other instrument, nor likewise of a foot or hand, that fire alone made it. And in the same way, neither would we say it of flesh; for of it too there is a certain work. Heat and cold would make them hard and soft, viscous or brittle, and whatever other affections of this sort belong to the animate parts, but when it comes to the ratio in virtue of which one is already flesh and another bone, this is no longer so; rather this is due to the movement that stems from the progenitor, which is actually what the thing potentially is, from which what comes to be comes to be, just as in the case of what comes to be in accord with craft; for heat and cold make the iron hard and soft, but what makes it a sword is the movement of the instruments containing the account belonging to the craft. For the craft is starting-point and form of what comes to be, but in another thing, while the movement belonging to the nature is in the thing itself, which stems from another nature that contains the active form.

Also, has the seed soul or not? The same argument applies to it as to the parts; for no soul will be in anything else whatever except in what it is in fact the soul of, nor will there be a part (other than homonymously, like a dead man's eye) that does not participate [in soul]. It is clear, then, that seed both has [soul] and is [a soul] potentially. But it is possible to be nearer and further potentially, as the geometer asleep is further than the one awake, and the latter than the one [actively] contemplating.

Of this process of generation, then, no part is a cause, but rather the primary external mover.[97] For nothing generates itself. But once it has come to be, from that point on it causes itself to grow. That is why indeed something comes to be first and not everything at the same time. And this first thing that comes to be is necessarily what contains the starting-point of growth; for whether plant or animal, this belongs to all alike, the nutritive part. (And this is what is generative of another like oneself; for this is the work of everything that is by nature complete, both animal and plant.) And this is necessary, because once something has come to be, it is necessary for it to grow. Therefore, though it was generated by something synonymous (for example, human being by human being), it grows because of itself. Therefore, it itself must be something if it causes growth. If, then, it is one something, and this a first thing, it necessarily comes to be first. So if the heart is the first thing to come to be in certain animals, and in those that do not have a heart the analog of this, the starting-point would be from this in the ones that have it, and in the others from its analog.

What the cause as starting-point is, then, in each case of generation, the primary mover and crafter, has been stated in response to the puzzles gone through previously.

2.2
The Nature of (Male) Seed

About the nature of the seed, someone might raise a puzzle. For seed when it emerges from the animal is coarse-grained and white, but when it cools it becomes liquid like water and its color is that of water. And this may seem strange; for while water does not become coarse-grained due to heat, the seed, on emerging from within the hot [animal], is coarse-grained, and on cooling becomes water. And yet watery liquids solidify, seed does not solidify if exposed to frost in the open air but liquefies, suggesting that the contrary of [cold] makes it coarse-grained. But then it is not reasonable either for it to be made coarse-grained by heat. For it is the things that
735[b]1 contain much earth that get composed and coarse-grained on boiling—for example, milk. It should, then, solidify on cooling. But as things stand nothing of it becomes solid, instead all of it becomes like water.

This, then, is the puzzle. For suppose it is composed of water: it is evident that water does not get coarse-grained due to heat, while the seed on emerging is coarse-grained and hot and the body it emerges from is hot; but if it is composed of earth, or is a mixture of earth and water, then it should not all become liquid and [like] water.[98]

Or is it that we have not distinguished all the results? For it is not only liquids composed of water and earthen material that get coarse-grained, but also those composed of water and breath—for example, foam becomes more coarse-grained and

97. I.e., the proximate one.
98. Reading καὶ ὕδωρ.

white, and the smaller and less clear the bubbles in it, the whiter and firmer the mass appears. Olive oil[99] is also affected in the same way; for on mixing with breath it gets coarse-grained, which is why the whitening [oil] becomes more coarse-grained—the watery material in it gets disaggregated by the heat and becomes breath. Lead ore[100] too, when mixed with water and olive oil and beaten, makes from a smaller mass a bigger one, from something liquid something firm, and from something black something white. The cause is that breath gets mixed in with it, and it makes the mass [bigger] and the whiteness show through, as in foam and snow; for snow too is a foam. And water itself on mixing with olive oil becomes coarse-grained and white; for, in fact, due to the friction breath gets enclosed and the oil itself also contains much breath; for oiliness is characteristic of breath, not of earth or water. That is also why it floats on the surface of water; for the air in it,[101] as if in a vessel, bears it up and makes it float and is the cause of its lightness. And in cold spells and frosts too oil gets coarse-grained, but does not solidify; in fact, because of its heat it does not solidify (for the air is hot and not freezable), but because the air is condensed and compacted by the cold, the oil becomes coarse-grained.

Due to these causes seed too is firm and white when it emerges from within, that is, due to the internal heat [of the animal], it contains much hot breath, but having emerged, when the heat has evaporated and the air has cooled, it becomes liquid and black; for, as in the case of phlegm, the water, and any small quantity of earthen material there may be, remain in the seed too as it dries.

Seed, then, is jointly composed of breath and water, and the breath is hot air. **736^{a}1** That is why it is liquid in nature, because it is composed of water. For what Ctesias of Cnidos said about the seed of the elephants is manifestly false. For he says that it hardens so much in drying that it becomes like amber. But this does not happen; for though one seed is of necessity earthier than another, and most so in those to which, in accord with the mass of their bodies, much earthen material belongs, it is coarse-grained and white because of being mixed with breath. For, in fact, the seed is white in all cases; for Herodotus[102] is not speaking the truth in saying that the semen of Ethiopians is black, as if it were necessary for everything belonging to someone with black skin to be black—and this even while seeing that their teeth are white! The cause of the whiteness of seed is that the semen is a foam, and foam is white, and most so that composed of the smallest particles, and small in the way that each bubble is invisible, precisely as happens indeed in the case when water and olive oil are mixed and beaten, as was said previously.[103]

99. *Mete*. $383^{b}20$–$384^{a}2$.
100. Lead sulfide.
101. Olive oil has breath in it and "breath is hot air" ($736^{a}1$).
102. 3.101.
103. $735^{b}21$–23.

Even the ancients[104] did not fail to notice that the nature of seed is foam-like (*aphrôdês*). At any rate, they named the goddess [Aphrodite] who is in control of sexual intercourse after this capacity.

The cause of the puzzle mentioned has now been stated, and it is evident that it is due to it that seed does not solidify either; for air does not solidify.

2.3
Male Seed Contributes Movements Alone; the Inheritance of Nutritive and Perceptual Soul and Understanding; the Role of Breath; Active and Potential Possession of Soul

The next puzzle to be stated is this. If, in the case of the animals in which semen is emitted into the female, what enters is no part of the embryo that comes to be, where is the corporeal part of it diverted to, if indeed it does its work by means of the capacity it has within itself? It is necessary to determine whether what is being composed in the female receives something, or nothing, from what has entered her, but also, concerning the soul in virtue of which an animal is so called (and it is an animal in virtue of the perceptual part of the soul), whether it is present within the seed and the fetus or not, and where it comes from [if it is]. For one could not regard the fetus as soulless, as in every way deprived of life; for both the seeds and the embryos of animals are no less alive than plants, and are fertile up to a certain point. That they have nutritive soul, then, is evident (and why they must acquire this first is evident from the determinations about the soul made elsewhere[105]), but as they proceed they **736b1** also have perceptual soul in virtue of which they are animals {. . .}.[106] For they do not at the same time become animal and human, or animal and horse, and likewise in the case of the other animals; for the last thing to come to be is the end, and the end of the coming to be of each thing is what is special to it. That is why as regards understanding, when, how, and from where it is acquired by those that participate in this starting-point involve a very great puzzle, and we must try hard to get a grasp on [these things] in accord with our capacity and to the extent possible.

As for the seeds and fetuses that are not yet separable, it is clear that they must be regarded as possessing the nutritive soul potentially, but not actively, until, like separated fetuses, they are drawing in nourishment and doing the work of this sort of soul; for, at first, all things of this sort seem to live the life of a plant. And it is clear that perceptual soul and understanding soul must be spoken about accordingly; for it is necessary for all soul to be possessed potentially before being possessed actively.

104. E.g., Diogenes of Apollonia A24 DK.
105. *DA* 2.4.
106. There is a lacuna in the text at this point.

For either they must all come to be [in the menses or matter] without existing beforehand, or they must all preexist, or some must, but not others; and they must be generated either in the matter without having entered in the male's seed, or in it having come from there; and in the male they must either all come to be [in the seed] from outside it, or none from outside, or some but not others. It is evident from the following that it is impossible for all to be present beforehand; for it is clear that it is impossible for all starting-points whose activity is bodily to be present without body (for example, walking without feet). So they cannot enter from outside; for they can neither enter by themselves, being inseparable, nor enter in a body; for the seed is a residue that comes to be by a change in the nourishment. It remains, then, that the understanding alone enters from outside and alone is divine; for bodily activity has nothing in common with its activity.

The capacity of all soul seems to be associated with a body distinct from and more divine than the so-called elements. And as souls differ from each other in esteem and lack of esteem, so too this sort of nature differs. For within the seed of everything there is present precisely that which makes the seeds be fertile, the so-called hot. This is not fire or that sort of capacity, but the breath enclosed within the seed and within the foamy part—that is, the nature in the breath, which is an analog of the element belonging to the stars. That is why fire does not generate any animal, nor, it is evident, anything composed in things affected by fire, whether wet ones or dry ones. But the heat of the sun and that of animals do generate—and not only does the heat due to the seed do so, but also if there happens to be some other residue belonging to its nature, still it too possesses a life-giving starting-point. That, then, the heat in animals is neither fire nor comes from fire is evident from these considerations.

As for the body of the semen, in which comes away part of the seed of the soul-involving starting-point,[107] part of which is separable from the body in all the ones in which a divine something is enclosed (and what is called "the understanding" is of this sort) and part inseparable—this body of the semen dissolves and evaporates, having a liquid and watery nature. That is why one should not look for it always to emerge outside, nor for it to be any part of the composed shape, any more than the fig juice that composes the milk; for it too changes and is no part of the mass that is being composed.

In what way, then, embryos and semen possess soul, and in what way they do not, has been determined; for they possess it potentially, but actively they do not.

Because the seed is a residue, then, and is being moved with the same movement as the one with which the body grows when the nourishment in its last stage is being partitioned, when it comes into the uterus, it composes and moves the female's residue with precisely the same movement that it is moving with itself. For that too is a residue, and it contains all the parts potentially, but none actively. For it even contains potentially the sorts of parts due to which there is a difference between

107. Reading τὸ σπέρμα τὸ τῆς ψυχικῆς ἀρχῆς. See *MA* 703^{a}9–27.

male and female. For just as from deformed progenitors sometimes deformed offspring come to be and sometimes not, in the same way too from a female a female sometimes comes to be, and sometimes not a female but a male. For the female is like a deformed male, and the menses are seed, but not pure seed; for there is one thing alone that they do not contain, the starting-point of soul. And because of that, in those animals in which wind-eggs occur, the egg that is being composed has the parts of both, but does not have the starting-point, which is why it does not become animate; for this starting-point is brought in by the male's seed. But once the residue of the female has partaken of this sort of starting-point, an embryo comes to be.

{Things that, though liquid, are of a corporeal nature when heated get surrounded by a crust, like the crusts that form on boiled ones as they cool. And viscosity holds all **737[b]1** bodies together. And it is precisely this, as they develop and become larger in size, that is acquired by what is sinewy in nature, which is precisely what holds together the parts of an animal, being sinew [itself] in some and its analog in others. And of the same shape are skin, blood vessel, membrane, and everything of that kind; for these differ in the more and the less and, in general, in excess and deficiency.}[108]

2.4
Generation of the Human Beings and Other Complete Animals; Development and Nutrition of the Embryo (1)

Among the animals having a more incomplete nature, once a complete embryo, though not yet a complete animal, has come to be, it is emitted externally; the causes of this were stated previously.[109] A fetus is complete from the moment when it is either male or female—that is, in the case of those animals where this distinction exists among the offspring; for there are some that generate offspring that are neither female nor male: the ones that themselves come to be neither from male and female progenitors nor from sexual intercourse between animals. About the generation of these we will speak later.[110]

The complete animals, the ones that are internally live-bearing, until they have generated a [complete] animal and sent it forth externally, keep the animal that comes to be naturally united with and within themselves.

The ones that are externally live-bearing but first internally egg-laying, once they have generated a complete egg, in some cases the egg is released, just as in the externally egg-laying animals, and the animal comes to be from the egg inside the female; in other cases, when the nourishment in the egg has been used up, the animal is completed by [nourishment] from the uterus, and that is why the egg is not released

108. This paragraph seems misplaced.
109. 732[a]24–733[b]23.
110. 3.9 (insects), 3.11 (hard-shelled animals).

from the uterus. This is the difference the selachian fishes exhibit, which later must be discussed by themselves.[111]

Now, however, we must first start with the first ones. And these are the live-bearing ones, and of these the human being is first.

In all animals the secretion of seed comes about just like that of any other residue. For each residue is spatially moved to its proper place without being forced by breath or being compelled by any other cause of this sort, as some people say it is, claiming that the sex organs draw the residue like cupping-glasses, forcing it by means of the breath (as if it were not possible either for this residue or that of the dry or liquid nourishment to have spatially moved elsewhere except by being forced), on the supposition that they aid in the emission of these residues by holding the breath. But this is common to all cases in which one must move something; for it is because of holding back the breath that strength springs up. Besides, even without this force **738^{a}1** the residues are secreted during sleep if the [proper] places are full of residue and relaxed. One might as well say that it is by the wind that the seeds of plants are on each occasion secreted to the places where they are in the habit of bearing fruit. Now, the cause of this, as was said,[112] is that in all animals there are parts receptive of the residues, both for the useless one (for example, for the dry and the liquid one[113]) [and for the useful ones]; and for the blood there are the so-called blood vessels.

In the case of females, there is the place around the uterus. The two blood vessels, the great blood vessel and the aorta,[114] are partitioned higher up into many thin blood vessels that end in the uterus. When these are overfilled from the nourishment, and the [female] nature, because of its coldness, is not capable of concocting it, it is secreted through the narrowest blood vessels into the uterus. But, because of its thinness, the uterus is incapable of receiving the excessive quantity, and so the affection that comes about is a sort of hemorrhage. The period is not exactly arranged in women, but it tends reasonably to occur when the moon is waning;[115] for the bodies of animals are colder when their environment happens to become so, and the times of new moon are colder because of the moon's complete waning, which is why too the end of the month is stormier than the middle. When the residue has changed into blood, then, the menses tend to occur in the period stated. But when the residue has not been concocted, a small quantity is always secreted, and this is why "whites"[116] occur in females while they are still small, in fact, children. If both these secretions of residues are moderate, their bodies are preserved, inasmuch as their occurrence is a purgation of the residues that are causes of their bodies being diseased. If, on the

113. Reading οἷον τῇ τε ξηρᾷ καὶ τῇ ὑγρᾷ.
114. The vena cava and the whole venous system, on the one hand, and the aorta and the whole arterial system, on the other.
115. There is in fact no correlation between the lunar cycle and the menstrual cycle.
116. *HA* 581^{b}2.

other hand, they do not occur, or occur excessively, they do harm; for they produce either diseases or an emaciation of their bodies. That is why "whites," if continuous and excessive, subtract from the growth of girls.

Of necessity, then, this residue occurs in women due to the causes stated; for since their nature is incapable of effecting concoction, it is necessary for a residue to occur, not only from the useless nourishment, but also from the blood in the blood vessels, which overflows when it fills the thinnest blood vessels. But for the sake of the better and the end, nature makes full use of it in this place[117] for the sake of generation, in such a way that another thing of the same kind occurs; for [the menses] is already potentially, at any rate, of the same sort as the body whose secretion it is.

In all females, then, it is necessary for a residue to occur, more though in the quite sanguineous ones, and, among these, most in the human being. But in the others too it is necessary for some composite to be collected in the uterine place. The cause of there being more in the quite sanguineous ones and most in the human being was stated previously.[118]

But though a residue of this sort is present in all females, it is not present in all males—for some males do not emit semen, but just as the ones that do emit it craft, by means of a movement within the semen, what is being composed from the matter present in the females, so the ones of this sort generate and compose it by means of a movement within themselves present in that part from which the seed is emitted. This is the place around the diaphragm in all those that have one; for the starting-point of the nature [of an animal] is the heart or its analog, while the lower [place] is an appendage that is for the sake of this. The cause, then, of not all males having a generative residue, while all females do, is that an animal is an animate body. And always the female provides the matter, while the male provides the crafter; for this is the capacity, we say, that each of them possesses, and being female or being male consists in this. So, while it is necessary for the female to provide body and mass, for the male it is not necessary. For neither is it necessary for the instruments or the producer to be present in what is coming to be. But it is the body that comes from the female, the soul from the male; for the soul is the substance of a certain body.

Because of this, in fact, if there is sexual intercourse between a female and a male animal that are not of the same kind (and there is sexual intercourse if their times [of heat] are equal, their pregnancies are quite similar, and the sizes of their bodies not too far apart), the first offspring has a common similarity to both (for example, the offspring of the fox and the dog, of the partridge and the chicken), but as time goes on and one offspring comes from another, the end result takes after the female in shape, just as alien seeds take after the region; for it is what provides the matter and the body for the seed.

117. The uterus.
118. 727[a]21–25, 728[a]30–[b]14.

And because of this the part in the females that is receptive—the uterus—is not [simply] a duct, but rather has dimension, while the males that emit seed have ducts, and these are bloodless. **739^{a}1**

Once each of the residues is in its own proper place it becomes that residue. Before then nothing is one, unless with much force, that is, contrary to nature.

The cause of the secretion of the generative residues in animals has now been stated. 5

But when the seed from the male (in those animals that emit seed) has entered, it composes the purest part of the residue—for the greater part of the menses, being liquid, is useless too, just as the most liquid part of the male semen is, even of a single emission. And the earlier part is more infertile than the later in most cases; for it 10 contains less soul-involving heat due to being unconcocted, while the concocted part has thickness and is more corporeal.

In those cases, whether of women or of other female animals, where an external emission does not occur, because there is not much useless residue present in this sort of secretion, as much occurs within them as is retained within those animals that emit 15 it externally, namely, what is composed by the capacity of the male that is present in the seed secreted by him, or by the part analogous to the uterus being inserted into the male, precisely as is seen to happen in the case of certain insects.

That the liquid accompanying sexual pleasure that is produced in females contrib- 20 utes nothing to the embryo was stated previously.[119] It might especially seem to do so because in women too, just as in males, so-called wet dreams occur at night. But this is no sign of anything; for in fact the same thing occurs in young men who are about to, but do not yet, emit semen, in fact emit nothing, or still more in those who emit something infertile. 25

Without an emission from the male in sexual intercourse, then, and without the womanly residue, whether emitted externally or whether present in sufficient quantities internally, it is impossible to conceive. Females conceive, however, without the pleasure that usually comes about in them during sexual intercourse, if the place 30 happens to be in heat and the uterus has descended within. But, for the most part, conception does occur this way because, when the secretion takes place, which is usually accompanied by pleasure both in males and in women, the mouth of the uterus has not closed. And, when this is so, there is also an easier passage for the seed of the male.

The emission does not take place within the uterus, as some people think (for 35 the mouth of the uterus is narrow), but rather in front of it, precisely where the female emits her wet secretion in some cases, is where the male too emits [his semen]. **739^{b}1** Sometimes it remains in this place, sometimes, if the uterus happens to be suitably disposed and hot due to the purgation, it draws [the semen] in. A sign of this is that pessaries, though wet when applied, are dry when removed. Further, in those 5

119. 727^{b}33–728^{a}1.

animals that have the uterus near the diaphragm, as the birds and the live-bearing fishes do, it is impossible for the seed not to be drawn in there, but instead to enter when emitted.[120] And this place, because of the heat present in it, does draw in the semen. And the secretion and collection of the menses kindle heat in this part, so that it is like conical vessels which, having been washed out with something hot, draw water into themselves when the mouth is turned downward.[121] And this is the way in which the drawing in occurs—it does not in any way occur, as some say, due to the instrumental parts involved in sexual intercourse. And the reverse process happens in fact for those who say that the female also emits seed; for if the uterus emits any outside itself, it will have to draw it back in again, if indeed it is to be mixed with the semen of the male. But for it to occur in this way is superfluous, and nature produces nothing superfluous.

When what is secreted in the uterus by the female has been composed by the semen of the male, what it does is much the same as what rennet does in the case of milk—for in fact rennet is milk that contains vital heat, which brings together what is similar into one and composes it, and the semen in relation to nature of the menses has the same effect; for the nature of milk and menses is the same.[122] When, then, the corporeal part comes together, the liquid one is secreted and, as the earthen parts dry out, membranes form in a circle around it. And this happens of necessity and for the sake of something; for it is both necessary for the extreme surfaces to dry out when heated and becoming cold, and the animal[123] must not be in liquid but separated from it. Among these [separators] some are called "membranes," others "choria"—they differ by the more and the less. They are present in egg-laying and live-bearing animals alike.

When the embryo is once composed, it does things in much the same way that sown seeds do. For the first starting-point[124] is also present in the seeds themselves. And when this, which previously was present potentially, has been distinctly formed, the shoot and the root are sent off from it. And it is by the root that it gets its nourishment; for the plant needs growth. So too in the embryo in a certain way all the parts are present potentially, but the starting-point is farthest along the route.

That is why the heart is the first to be distinctly formed actively. This is clear not only to perception (for it happens this way), but also to reason; for when what is coming to be is distinctly formed and free from both parents, it must manage for itself, just like a son who has set up house away from his father. So that is why it must have a starting-point from which even the later orderly arrangement of the body in animals derives. For if it is to come in from the outside at some time and be present in it later, not only might one be puzzled as to the time, but also because it is necessary,

120. Aristotle calls the ovarian passages of birds and fishes a "uterus."
121. As in cupping.
122. Since both are late stages in the concoction of nourishment.
123. The fetus.
124. I.e., nutritive soul.

when each of the parts is being separated out, for this starting-point to be present first, the one from whose presence both the growth and the movement of the various parts derives.

That is why all those who say, like Democritus, that the external parts of animals become disaggregated first, and later the internal ones, do not speak correctly. It is as if they were speaking of animals made of wood or stone; for things of this sort have no starting-point at all, while all animals have one and have it within. That is why the heart is manifestly the first thing to become distinct in all blooded animals; for it is a starting-point of both the uniform and non-uniform parts. For this already deserves to be called the "starting-point" of the animal and its composition at the moment when it needs nourishment; for what is [an animal] of course grows. And for an animal nourishment in its last stage is blood or its analog, and of these the blood vessels are the receptacle. That is why the heart is the starting-point of these too. This is clear from the *History of Animals*[125] and the *Dissections*.

Since the embryo is already potentially an animal, but is incomplete, it is necessary for it to get its nourishment from elsewhere. That is why it uses the uterus, that is, the mother to get nourishment, just as a plant uses the earth, until it is complete to the point of being already an animal capable of movement by walking. That is why nature has first traced out the two blood vessels from the heart, and from these hang smaller blood vessels near the uterus, forming what is called the "umbilical cord." For the umbilical cord is a blood vessel, consisting of one vessel in some animals, and of several in others. Around these is a skin-like sheath, because the weakness of the blood vessels needs preservation and shelter. The blood vessels are attached to the uterus like roots, and through them the embryo gets its nourishment. For it is for the sake of this that the animal remains in the uterus, and not, as Democritus says, so that the parts may be molded in accord with the parts of the mother. This is evident in the case of the egg-laying animals; for they get their disaggregation in the eggs, when they have separated from the matrix.[126]

But one might raise a puzzle, if the blood is nourishment, and the heart, being already filled with blood, is the first thing to come to be, and the nourishment comes from outside, where did the first nourishment[127] enter from? Perhaps it is not true that all of it comes from outside, but rather, just as with the seeds of plants, where there is something of this sort present in them which at first has a milky appearance, in the same way too, the residue of the matter in animals of which they are composed is their nourishment from the outset.

The growth in the embryo occurs, then, by means of the umbilical cord in precisely the same way as the growth in plants does by means of the roots, and as in

125. 3.3.
126. I.e., the cervix including the orifice of the womb. *HA* 510^{b}14.
127. I.e., the blood already in the heart when it first came to be.

animals themselves when they are free of the nourishment within themselves. These issues must be spoken about later, at the opportune time for the proper accounts.[128]

The disaggregation of the parts, however, does not occur in the way that some people suppose,[129] by like naturally being carried to like (for in addition to the many other difficulties involved in this account, it follows that each of the uniform parts comes to be separately, for example, bones by themselves, and sinews and flesh by themselves, if one accepts this cause). Instead, it is because the residue of the female is potentially such as the animal is by nature and each of the parts is present in it potentially, but none actively, and it is due to this cause that each of them comes to be, and because, when what can affect and what can be affected make contact in the way in which one can affect and the other can be affected (by "way," I mean, how, where, and when), then straightaway the one affects and the other is affected. The female provides the matter, while the male provides the starting-point of the movement. And as the things that come to be due to craft come to be because of its instruments—or to put it more truly, because of the movements of these—and this is the activity of the craft, and the craft is the shape of the things that come to be that is present in something else, so it is with the capacity of nutritive soul. Just as it also does in the animals and plants themselves later on, it generates growth from nourishment, using heat and cold as instruments (for it is in these that its movements are present and a certain account of each [part of the animal]), in the same way as well it composes from the outset what is by nature coming to be. For the matter by which the thing grows is the same as that of which it is first composed, so that the productive capacity [of growth] is the same as the starting-point of [the animal]; although it is greater. If, then, it is the nutritive soul, it is also the generative one. And it is the nature of each thing, present in all plants and animals, while the other parts of the soul are present in some living things, not present in others.

In plants the female is not separated from the male. In some of the animals, however, it is separated, and in these the female has need of the male in addition.

2.5
Why Female Needs Male

And yet one might be puzzled as to what cause this is due to. If indeed the female possesses the same soul [as the male] and the matter is the residue of the female, why has the female need of the male in addition, why does it not itself generate from itself? The cause is that animal differs from plant by perception. And it is impossible for face, hand, flesh, or any other part to exist without perceptual soul being present in it either actively or potentially, whether in some way or unconditionally; for it will

128. 3.2.
129. E.g., Hippocrates, *The Nature of the Child* 17.1–9.

be like a corpse or part of a corpse. If, then, it is the male that is productive of this sort of soul, in cases where the female and the male are separated, it is impossible for the female itself to generate an animal from itself; for what was mentioned[130] is the being for what is male.[131] But that there is a reason for the puzzle stated is evident from the case of those birds that lay wind-eggs, since it shows that up to a point the female can generate. But this too involves a further puzzle as to what way we are to say their eggs are alive; for it is neither possible for it to be in the way that fertilized eggs are (for then an actually animate thing would come to be from them), nor again in the way that wood or stone is. For there exists for these eggs as well [as for fertile ones] a sort of passing away, suggesting that previously they in a way participated in life. It is clear, then, that they possess a sort of soul potentially. But what sort of soul is it? It is necessary, surely, that it be the last. And this is the nutritive; for it is present alike in all animals and plants. Why, then, does it not complete the parts and the animal? Because these must possess perceptual soul; for the parts of animals are not like those of plants. That is why there is a need for the contribution of the male; for the male is separated from the female in these cases. And this is precisely what happens; for wind-eggs become fertile if in a certain period of time the male mates with the female. But the cause of these things will be determined later on.[132]

If there is any animal kind that, though the female exists, contains no separated male, it is possible that this generates an animal from itself. Though this precise thing has not been observed in a reliable way up to now at least—a case in the fish kind does make one hesitate; for among the ones called "erythrinus" no male has so far been seen, while females and females full of embryos have been. But of this we have as yet no reliable experience. Also, ones that are neither female nor male exist in the fish kind—for example, the eels and the mullet kind found in marshland rivers.

But in those animals where the female and the male are separated, it is impossible for the female by itself to bring generation to a complete end; for otherwise the male would be pointless, and nature produces nothing pointless. That is why in animals of this sort the male always completes the generation. For he produces the perceptual soul in [the embryo] either due to himself or due to his semen.

Because the parts are present potentially in the matter, once the starting-point of movement has come to be, just as in those wondrous automata, one thing follows another in succession. And what certain of the natural scientists[133] must mean when they say that "like is naturally carried to like" is not that the parts move in the sense of changing their places, but rather that they remain where they are and undergo alteration in softness, hardness, color, and the other differences of uniform things—becoming actively what they previously were potentially.

130. I.e., being productive of perceptual soul.
131. Reading ἄρρενι.
132. 750^{b}3–751^{a}30, 757^{b}1–30.
133. In particular, Hippocratics.

What comes to be first is the starting-point. This is the heart in the blooded animals, and its analog in the others, as was said often.[134] And it is evident not only to perception that it comes to be first but also around the last moments; for the heart is what life leaves last. And it happens in all cases that the last to come to be is the first to leave, and the first last, as if nature ran a double course, turning back to the starting-point from which it came. For coming to be is from what is not to what is, and passing away from what is back again to what is not.

2.6
Development of the Embryo (2)

After the starting-point, as was said,[135] the internal parts come to be earlier than the external ones. The larger parts become apparent earlier than the smaller ones, although some of them do not come to be earlier. First, the parts above the diaphragm become articulated and are superior in size, while what is below is smaller and not distinctly formed. And this happens in all cases in which the upper and the lower are distinctly formed, except in the insects. In those that are given birth to as larvae, growth occurs toward the upper part; for the lower part is smaller from the start. Lack of distinction between the upper part and the lower parts, among the animals that move by walking, exists only in the soft-bodied animals. And what was just said applies in the case of the plants as well: the upper body comes to be earlier than the lower. For the seeds send out roots earlier than shoots.

The parts of animals are distinctly formed by breath—not however by that of the female progenitor or of [the embryo] itself, as some of the natural scientists[136] say. This is evident in the case of the birds, the fishes, and the insects; for some of these, after being separated from the female progenitor, come to be from an egg, within which they get their articulation, while other animals do not breathe at all, but are given birth to as larvae or as eggs. Others, though they breathe and get their articulation within the womb, do not breathe until the lung has got its end,[137] the preceding parts too getting their articulation in this way before the animals breathe. Further, the many-toed four-footed animals—for example, the dog, the lion, the wolf, the fox, and the *thôs*[138]—all generate blind young, and the eyelid does not divide until some time after their birth. So it is clear that it is also the same way in the case of all the other parts: just as its quality and its quantity come to be, preexisting potentially but later actually, due to the same causes due to which its quality is distinctly formed, and

134. E.g., 738ᵇ16–17, 740ᵃ3–4, 17–18, 22–23.
135. 740ᵃ12–23.
136. Hippocratics again.
137. I.e., its articulation.
138. *HA* 507ᵇ17.

two things come to be from one [eyelid]. But for breath to be present is necessary, because it is wet and hot, the hot affecting and the wet being affected.

Some of the ancient natural scientists attempted to state which part comes to be after which, but had not very much experience of the facts. For in the case of the parts, as with other things, one is naturally prior to another. But, in fact, something is [said to be] prior in many ways; for the for-the-sake-of-which and what is for the sake of this are different, and of these the latter is prior in coming to be, the former in substance.[139] But what is for the sake of this also exhibits two differences; for one is what the source of movement is, and the other is what the for-the-sake-of-which uses. I mean, for example, what is generative and what is an instrument for what comes to be; for of these, one must be possessed prior, the one capable of affecting (for example, the teacher is prior to the one who learns), and other posterior (for example, the pipes to the one learning to play them); for it is superfluous for those to possess them who do not have the scientific knowledge of how to play them.

There are, on the one side, three things: one is the end, which we say is [the] for-the-sake-of-which; second, the starting-point that is capable of causing movement in, and is generative of, the things that are for the end's sake (for what is productive and generative, insofar as they are such, are such in relation to what is produced and what comes to be); third, what is useful, that is, what the end uses. On the other side, it is necessary, first, for there to be present some part in which the starting-point of the movement resides (for even from the outset this part is a part of the end and the most controlling one); next after this, the whole and the end; thirdly and finally, the instrumental parts that these put to various uses. So, if there is something of this sort that is precisely what is necessarily present in animals, containing the starting-point and end of their entire nature, it is necessary for it to come to be first—first, insofar as it is capable of causing movement, but, insofar as it is a part of the end, along with the whole.

So those instrumental parts that are generative in nature must always be present themselves prior [to the others] (for, as a starting-point, they are for the sake of something else); those parts that are not of this sort, but are for the sake of something else, posterior. That is why it is not easy to determine which parts are prior, the ones that are for the sake of something else, or the one these are for the sake of. In fact, the parts capable of causing movement intrude [between the other parts], because they are prior to the end in coming to be, but it is not easy to determine between the parts capable of causing movement and the instrumental parts [as to which is prior]. And yet in accord with the present methodical inquiry we must inquire about what comes to be after what; for the end is posterior to some parts and prior to others. And because of this the part that contains the starting-point comes to be first, next the upper body. That is why the parts around the head and the eyes appear largest from the start in embryos, while the parts below the navel—for example, the legs—appear

139. *Met.* 1035^{b}14–27.

small. For the lower parts are for the sake of the upper ones, and are neither parts of the end nor generative of it.

But people do not speak correctly, not even about the necessity belonging to "what it is due to," who say that "this is the way it always comes to be," and consider this to be a starting-point in these cases. Thus Democritus of Abdera says that of what is unlimited[140] there is no starting-point, but what something is due to is a starting-point and what is always is unlimited, so that to ask for what it is due to in cases of this sort, he says, is to seek a starting-point for what is unlimited. And yet according to this argument, according to which it is fitting not to seek what the thing is due to, there will be no demonstration whatever of what is eternal. But it is evident that there are many, both of things that always come to be and of things that always are, since the triangle always has angles equal to two right angles and the diagonal is eternally incommensurable with the sides, but nonetheless there is a cause and a demonstration of these things. While, then, it is correctly said that it is not fitting to seek a starting-point in all cases, it is not correctly said of all the things that always are and always come to be, but [only] of those that really are starting-points of what is eternal; for of a starting-point there is another sort of knowledge and not a demonstration. A starting-point in the case of immobile things is the what-it-is, but in the case of things that come to be there are immediately several starting-points—although the way [each is a starting-point] is distinct and not the same for all. One of this number is the starting-point from which the movement comes. That is why all the blooded animals have a heart first, as was said at the start,[141] while in the other animals it is the analog of the heart that comes to be first.

743ᵃ1 From the heart, the blood vessels extend throughout [the body], as in the mannikins drawn on the walls;[142] for the parts lie around these because they come to be from them. The generation of the uniform parts is due to cold and heat; for some are composed and solidified by cold, others by heat. The differences of these have been spoken about previously elsewhere,[143] and what sorts of things are dissolvable by liquid and by fire, and what sorts are non-dissolvable by liquid and un-meltable by fire. As the nourishment oozes through the blood vessels, then, and the ducts in each of the parts, like water in unbaked pottery vessels, flesh or its analogs are composed due to the cold, which is why it is also dissolved due to fire. But of the things arising [from the blood vessels] the ones that are too earthen, because they contain too little liquid and heat, cool as the liquid evaporates along with the heat, becoming hard and earthen in shape—for example, nails, horns, hoofs, and beaks. That is why these are softenable by fire, while none is meltable by it, although some are by liquids—for example, the shells of eggs.

140. Secluding ἀεὶ καὶ.
141. 740ᵃ3–4.
142. Presumably, of Aristotle's "lecture room." See 764ᵇ20–31, *HA* 515ᵃ34–35.
143. *Mete*. 4.7–10.

Due to the internal heat, the sinews and the bones come to be as their liquidity dries. That is why in fact bones are non-dissolvable due to fire, just like pottery; for it is as if they have been baked in an oven due to the heat present in their generation. But this heat does not make any random thing to be flesh and bone, nor in any random place, nor at any random time, but rather what is natural, where it is natural, and when it is natural. For neither will what potentially is [be produced] due to what does not actively possess the capacity to move it, nor will what actively possesses it produce it from a random thing, any more than a carpenter could produce a box except from wood, nor without him will a box [be produced] from the wood.

And the heat is present in the spermatic residue and the movement and the activity it possesses are of such a quantity and sort as to be proportional to each part. But to the extent that there is any deficiency or excess to that extent what comes to be is completed in a worse way or is deformed, in much the same way as the one in which external things[144] are composed due to boiling, [for example,] to make nourishment more pleasant, or for some other work. But here it is we who establish the proportion in the heat required for the movement, while there it is the nature of the male progenitor that provides it. In the case of those that come to be spontaneously, on the other hand, the cause is movement and heat at the proper time.

Cooling is privation of heat. Nature uses both, because of necessity they have a capacity, so that they make one thing this and another thing that, but, of course, in the case of what is produced, it is for the sake of something that the one of these cools **743^{b}1** and the other heats and that each of the parts comes to be—flesh being made soft, on the one hand, of necessity, and, on the other, for the sake of something; sinew, dry and pullable; and bone, dry and shatterable.

The skin comes to be as the flesh dries just as so-called scum forms on liquids in which things are boiled. This is not only because its generation occurs at the extremity of [the body], but also because what is viscous stays at the surface, because it is not capable of evaporating. While in other animals the viscous is dry (which is why the extremities of the bloodless ones are hard-shelled or soft-shelled), in the blooded ones the viscous is more oily. And in those among the latter ones whose nature is not too earthen, what is fatty gathers under the covering of their skin, suggesting that the skin comes to be from this sort of viscous material; for what is oily is somewhat viscous. And all these, as we stated, must be said to come to be in one way of necessity, and in another way not of necessity but for the sake of something.

The upper body, then, is the first thing marked off in the course of generation, while in the blooded animals the lower gets its growth as time goes on. All the parts have their outline shapes determined earlier, and later get their colors and their degrees of softness and hardness, absolutely as if they were crafted by an animal

144. Things outside the uterus.

painter: nature; for painters too, after having traced the animal in outline shape by means of lines, just apply the colors.[145]

Because the starting-point of the perceptual modalities and of the entire animal is in the heart, the heart is the first part to come to be, and because of its heat, at the place where the blood vessels terminate above, the cold composes the brain, as a counterpart to the heat around the heart. That is why the [parts] around the head get their generation next after the heart, and surpass the others in size; for the brain is large and liquid from the start.

There is a puzzle, however, about what happens with the eyes of animals. For though at the start they appear very large in animals, whether they walk, swim, or fly, yet they are the last of the parts to be composed completely; for they shrink into line in the meantime. The cause is that, though the perceptual organ of the eyes, like the other perceptual organs too, is set on ducts, [there is the following difference]: while the perceptual organ of touch and taste is just the body or some part of the body of animals, and smell and hearing are ducts, connected to the air outside, that are full of innate breath, and terminate at the little blood vessels around the brain that extend from the heart, by contrast, the eye is the only one of the perceptual organs that has a special body of its own. It is liquid and cold and does not preexist in its place, as the other parts preexist potentially, and then become so actively later on, but instead the purest of the liquid from around the brain is secreted through the ducts that are visible leading from the eyes to the meninx[146] around the brain.

A proof of this is that, besides the brain, no other part in the head is liquid and cold except the eye, which is cold and liquid. Of necessity, then, this place gets large at first, but shrinks into line later; in fact, it also happens in the same way with the brain; for first it is liquid and large, but as evaporation and concoction proceed the brain too becomes more body-like and shrinks into line, as does the size of the eyes. But at the start, because of the brain, the head is very large, and because of the liquid in the eyeballs, the eyes appear large. They are the last to reach the end of their completion because the brain too is composed with difficulty; for it is [only] later on that its coldness and liquidity come to an end.

[And this is so] in the case of all those animals having brains, but especially in the case of the human beings. For this is why the bregma is the last of the bones to come to be; for in the case of embryos that come to be externally, this bone is still soft in the children. (The cause of this happening especially in the case of the human beings is that of the animals their brain is the most liquid and largest, and the cause of this, again, is that the heat in their heart is purest. And their thought makes clear how well blended it is; for the most practically wise of the animals is the human being.) But even children for a long time have no control of their head, which is because of the

145. A *zôgraphos* is someone who paints from life; a *zôion* is both a painting (not necessarily of an animal) and an animal (*Cat.* 1ᵃ1–6).
146. *HA* 495ᵃ8–9.

heaviness of the brain. And likewise too in the case of the parts that must move; for it is [only] later on that the starting-point of movement gets control over the upper parts, and last of all over those whose movement is not closely connected with it, like that of the limbs. And the eyelid is a part of this sort. And since nature produces nothing superfluous or pointless, it is clear that neither does it produce anything too late or too soon; for otherwise what comes to be will be either pointless or superfluous. So it is necessary for the eyelids to be separated at the same time as [the animal] is capable of moving them. It is later on, then, because of the amount of concoction required for the brain, that the eyes of animals are completed, and they last of all the parts, because the movement must be very controlling in order to move what is so far away from the starting-point and so cold. And it is clear that the eyelids have a nature of this sort; for if any degree of heaviness whatever comes about in the head, due to sleep, drunkenness, or anything else of this sort, we are also incapable of raising our eyelids, even though the weight they have is so small.

As regards the eyelids, then, it has been stated how and why they come to be, and due to what cause they are the last to get their articulation.

Each of the other parts comes to be from the nourishment: the most estimable ones and the ones participating most in the most controlling starting-point, from the nourishment that is concocted, purest, and first; the ones that are necessary and for the sake of the former ones, from the inferior nourishment, and from the leftovers and residues. For like a good household manager, nature too is not accustomed to throw anything away from which something useful can be made. In the management of households, however, the best of the available nourishment is assigned to the free males, while the inferior nourishment and the residues of the other is assigned to the household slaves, and the worst is given to the animals that are nourished along with them. Just, then, as the understanding produces from outside[147] these things for their growth, so within the things themselves that come to be the nature composes flesh and the bodies of the other perceptual organs from the purest matter, while from the residues it composes bones, sinews, and hair, and further, nails, hoofs, all things of this sort. That is why these are the last to get composed, namely, when a residue for the nature [to use] has already come to be.

The nature of the bones, then, comes to be in the first composition of the parts from the spermatic residue, and, as animals grow, they get their growth from the natural nourishment (which is precisely what the controlling parts get theirs from), but [only] from the leftovers and residues of this. For in every case a first and a second sort of nourishment comes to be, one nutritive and the other growth-productive. Nutritive is what provides the being to the whole and the parts, growth-productive is what produces increase in size. Determinations about these must be made later on.[148]

147. Reading θύραθεν. Presumably, "from outside" means from outside the human beings and animals that constitute the household.
148. Reference unclear.

The sinews are composed in the same way as the bones, and from the same things,
745a1 the spermatic residue and the nutritive. Nails, hair, hoofs, horns, beaks, the spurs of male birds, and any other part of this sort, on the other hand, are composed from the supplementary and growth-producing nourishment acquired from the female and from outside. And it is because of this that the bones get their growth [only] up to
5 a certain point; for there is a limit of size for all animals, which is why there is also one of growth of the bones. For if these always had growth, whichever animals had bone or its analog would grow as long as they lived, because bones are the defining mark of size for animals. Due to what cause they do not always get growth must be
10 stated later.[149] Hair and things of the same kind as it go on growing as long as they exist. And do so more during diseases, and when bodies are getting old and diminish, because more residues are left over, since less get used up by the controlling [parts] because of old age and diseases—although when these residues too fail due to time of
15 life, the hair also fails. The bones, however, do the contrary; for they diminish along with the body and its parts. Hair goes on growing even after death, although it does not restart to grow.

About the teeth, however, one might raise a puzzle. For they have the same nature as the bones and come to be from the bones, while the nails, the hair, the horns,
20 and things of that sort come to be from the skin, which is why they change in color along with the skin; for they become white, black, and all sorts of colors according to the color of the skin. The teeth do none of this; for they are from the bones—at any rate, in those animals that have teeth and bones. And they alone among the various
25 bones go on growing throughout life. This is clear from teeth that turn aside and do not make contact with each other.[150] The cause of their growth, as that for whose sake it is, is due to their work; for they would soon be worn down if there were not some compensating process, since even as things stand, in some aging animals that are voracious but do not have large teeth, they are altogether worn down; for their
30 destruction proceeds at a greater rate than their growth. Hence in this case too nature has contrived things well with an eye to the result; for it makes the decline of the teeth coincide with old age and death. If life lasted for ten thousand years, or even for a thousand, the teeth would have to be extremely large from the start and grow
35 anew many times; for even if they had got their growth continuously, they would
745b1 nonetheless have been worn down and been useless for their work. What their growth is for the sake of, then, has now been stated.

But it turns out that the teeth do not have the same nature as the other bones either; for they all come to be in the first composition and none of them later, while
5 the teeth come to be later. That is why in fact it is possible for them to grow again after [the previous ones] have fallen out; for though they make contact with the bones, they are not naturally united with them. Yet they come to be from the nourishment

149. Reference unclear.

150. True of the incisors of rodents and tusks of elephants, but not of all teeth.

that is distributed to the bones (which is why they have the same nature), and at a time when the latter have already attained their full complement.

The other animals are born possessing teeth or the analog of teeth, unless something contrary to nature occurs, because when they are brought forth from their progenitor they are more complete than the human being. But the human being, unless something contrary to nature happens, does not have them.

The cause due to which some teeth come to be and fall out, while others do not fall out, will be stated later.[151]

It is because parts of this sort come from a residue that the human being is the most bare-skinned of all the animals and has the smallest nails for its size; for it has the smallest quantity of earthen residue. A residue is what is unconcocted, and what is earthen is what in the bodies of all animals is least concocted.

How each of the parts is composed, then, has now been stated, as has what the cause is of their coming to be.

2.7
Nutrition of the Embryo (2); Hybrids and Sterility

In live-bearing animals the fetuses get their growth, as was said previously,[152] through the umbilical cord. For since the nutritive capacity of the soul, as well as the others, is present in animals, it immediately sends out the umbilical cord like a root to the uterus. The umbilical cord consists of blood vessels in a sheath, more numerous ones in larger animals (for example, the cow and the like), two in intermediate-sized animals, and one in the smallest ones. Through it the fetus gets its sanguineous nourishment; for the uterus is the terminus of many blood vessels.

All animals without two rows of teeth, and all those with two,[153] whose uterus does not have one great blood vessel running through it but many ones close together instead, have in their uterus the so-called cotyledons, {(the umbilical cord connects to these and is naturally attached to them; for the blood vessels, which run through the umbilical cord on this side and on that, divide up [into smaller ones] all over the uterus, and it is where they terminate that the cotyledons come to be),}[154] with their convex side toward the uterus, their concave one toward the fetus. Between the uterus and the fetus are the chorion and the membranes. As the fetus grows and becomes complete, the cotyledons become smaller, and finally disappear when it is completed. **746^{a}1** For nature prepares the sanguineous nourishment for fetuses in this part of the uterus as in breasts, and because the cotyledons are gradually gathered together from many

151. 788^{b}3–15.
152. 740^{a}24–^{b}2.
153. Ruminants.
154. These lines are absent in some mss.

into a few, the body[155] of the cotyledon becomes like an eruption or inflammation. As long as the fetus is comparatively small, incapable of taking much nourishment, they are clearly visible and large, but when it has grown, they shrink.

But most of the docked animals[156] and most of those that have two rows of teeth have no cotyledons in their uterus, but the umbilical cord extends to meet a single blood vessel that is large and extends throughout the uterus. Some of these animals are one-offspring-bearing, others many-offspring-bearing, but the several fetuses are connected to it in the same way as the one. (But one must observe these things with the help of the paradigms drawn in the *Dissections* and in the *History of Animals*.[157]) For the animals grow out from the umbilical cord, and the umbilical cord from the blood vessel, and they are next to each other along the stream of the blood vessel as along a water pipe. And around each of the fetuses are membranes and a chorion.

Those who say[158] that children are nourished in the uterus through sucking on a bit of flesh do not speak correctly; for if this were so, the same would occur in the case of the other animals, but as things stand it manifestly is not (in fact this will easily be seen in dissections). Also, all fetuses alike, whether of animals that fly, swim, or walk, have thin membranes that encompass them, separating them from the uterus and from the liquids that arise in it, and neither in these membranes themselves is there anything of the relevant [nourishing] sort, nor is it possible that anything of advantage will be gotten through them. As for those laid as eggs, it is evident that all of them get their growth on the outside, when separated from the matrix.

Copulation in accord with nature occurs between animals of the same kind, nonetheless it also occurs between those that have a close nature, although not undifferentiated in form, if their size is much the same and if the times of their pregnancy are equal. Although, in the case of other animals, such occurrences are rare, it does occur in the case of the dogs, the foxes, and the wolves.[159] And Indian hounds[160] are born from some wild dog-like animal and a dog. And in the case of the birds that mate
746[b]1 frequently it has been seen to occur—for example, in the case of the partridges and the hens. And among the crook-taloned birds, the hawks that differ in form seem to have sexual intercourse with each other, and it is the same way in the case of certain other birds as well. In the case of the sea animals nothing worth mentioning has been seen; but the ones called *rhinobatos*[161] especially does seem to come to be from the copulation of the angelfish (*rhinê*) and the ray (*batus*). And it is said that the proverb

161. *HA* 566[a]26–30.

about Libya suggesting that "Libya is always nourishing something new"[162] is because there animals not of the same family have sexual intercourse with each other; for it is said that because of the scarcity of water they all meet at the few places with springs and have sexual intercourse, even those that are not of the same sort.

Among the animals that come to be from this sort of sexual intercourse all are seen to copulate again with each other and are capable of generating both a female and a male, while the mules alone among the animals of this sort are infertile; for they do not generate either through sexual intercourse with each other or with other animals. There is, however, a universal problem as to what the cause is due to which a male or a female is infertile; for there are both women and men who are infertile, and in the case of the other animals there are some in each kind—for example, the horses and the sheep. But in this case, the case of the mules, the whole kind is infertile. In the case of the others, the causes of their infertility are several; for both women and men are infertile from birth when the places used for sexual intercourse are deformed, so that the former do not have pubic hair and the latter do not grow a beard but remain like eunuchs. But others, as they advance in age, are affected in the same way, sometimes because of their well-nourished bodies (for in women who are too fat and in men who are in too good condition, the spermatic residue is used up by the body, and in the former menses do not occur or in the latter semen), and sometimes, because of disease, men emit semen that is cold and liquid, while the purgations [of menses] by the women are bad and full of diseased residues.

But in the case of many men and many women, this affection occurs because of deformations in the parts and the places useful for sexual intercourse. Some of these are curable, some incurable, but those especially remain infertile if things of this sort have come about in the first composition;[163] for then mannish women and womanish men come to be, and in the former menses do not occur, while in the latter the seed is fine-grained and cold. That is why the [semen] of males is reasonably tested for infertility by trials in water; for what is fine-grained and cold quickly disperses on the surface, while what is fertile sinks to the bottom; for what is concocted is hot, and what is composed and coarse-grained has been concocted. They test women, on the other hand, by means of pessaries,[164] to see whether its odors penetrate upward from below to the exhaled breath, and by colors rubbed on the eyes to see whether they color the sputum in the mouth. For if these things do not result, it makes it clear that, in the body, the ducts through which the residue is secreted are commingled and grown together. (For the place around the eyes, of all those around the head, is the most spermatic. This is made clear by the fact that during acts of sexual intercourse it alone changes its configuration in an obvious way, and that those who indulge too much in sexual intercourse have manifestly sunken eyes.[165] The cause is that the

162. *HA* 606ᵇ19–20.
163. I.e., the one from the spermatic residue (744ᵇ27, 745ᵇ4).
164. These were scented with various fragrant herbs.
165. †*Pr.* 876ᵃ36–ᵇ17.

nature of the semen is similar to that of the brain; for the matter of it is watery, and the heat acquired.) Also, the spermatic purgations are from the diaphragm; for the starting-point of the nature is there, so that the movements from the sexual parts penetrate to the thorax,[166] and all the odors from the thorax become perceptible via the breathing.

2.8
Mules

In the human beings, then, and in the other kinds, as was said previously,[167] this sort of deformation occurs in particular individuals, but in the case of the mules, the whole kind is infertile. About its cause, Empedocles and Democritus speak (the first not in a perspicuous way, Democritus in a better known one), but they did not speak correctly. For they state their demonstration alike in the case of all the animals that copulate contrary to sameness of kind.

For Democritus says that the ducts of mules are destroyed in the uterus because the animals do from the start come to be from those that are not of the same kind. This latter happens in the case of other animals and they generate nonetheless—and yet it is necessary, if indeed this were the cause of their infertility, for all the others that have sexual intercourse in this way to be infertile too.

Empedocles, on the other hand, makes the cause be the mixture of the seeds becoming coarse-grained as a result of the semen of each being soft (for the hollows of one fit into the coarse-grains of the other, just like bronze mixed with tin)—not even stating the cause correctly in the case of bronze and tin (they are spoken about in the *Problems*[168]), nor, in general, producing his starting-points from known things. For how do the hollows and the coarse-grains fit together to produce the mixture, for example, of wine and water? For this saying is beyond us; for the way we are to understand the hollows of wine and of water is too far contrary to perception.

Further, since in fact it happens that from horses a horse comes to be, from asses an ass, and from a horse and an ass a mule does so, and in two ways, depending on whichever of the two is male or female, why is it that from these something so coarse-grained is produced that what comes to be [from it] is infertile, while from a female and male horse or a female and male ass what comes to be is not infertile? And yet, though the seed of both the male horse and the female one is soft, both a female horse and a male ass and a male horse and a female ass have sexual intercourse, and that is why what comes to be from both is infertile, he says: because from the two one thing comes to be that is coarse-grained, because the seeds are soft. But so it should also be, then, when it comes to be from a male and female horse. For if only one of the

166. *HA* 491a29–30.
167. 746b12–747a2.
168. There is nothing about this in the extant †*Pr*.

two had sexual intercourse, it would be open to say that one of the two's not being a match for the semen of the ass was the cause of its not generating. But as things stand, whatever sort it is in that intercourse, it is this same sort too in intercourse with an animal of the same kind.

Further, the demonstration is stated alike for both the female and the male mule—the male alone does generate (and does so at the age of seven years), so it is said; the female, on the other hand, is wholly infertile, and even she is so [only] because she does not nourish [the embryo] to the end, since cases have been observed of a female mule that contained an embryo.

But perhaps a logico-linguistic demonstration might seem more persuasive than the ones stated—I call it "logico-linguistic" because, in being more universal, it is further away from the proper starting-points. It is something like this: Suppose that from a male and a female of the same form a male or a female naturally comes to be that is of the same form as its progenitors (for example, from a male and a female dog a male or a female dog), while from a pair distinct in form, one distinct from them in form comes to be (for example, if a dog is distinct in form from a lion, from a male dog and a female lion one distinct from them in form also comes to be, and from a male lion and a female dog too). So, since a male and a female mule come to be and are not different in form from each other, and a mule comes to be from a horse and an ass, and these are distinct in form from mules, it is impossible for anything to come to be from mules; for something of a distinct kind cannot come to be, because what comes to be from a male and female of the same form is the same in form as they, and a mule cannot, because it comes to be from a horse and an ass, which are distinct in form, and it was accepted that from animals distinct in form a distinct [form of] animal comes to be.

But, in fact, this argument is too universal and empty; for arguments that are not from the proper starting-points are empty: they seem to be based on the things at issue, but are not really. For [arguments] from geometrical starting-points are geometrical ones, and likewise in the other cases. But what is empty, though it seems to be something, is nothing. And it is not true; because many animals that come to be from ones not of the same form are fertile, as was said previously.[169] One should not, then, inquire in this way either concerning other things or concerning natural ones.

Rather it is from getting a theoretical grasp on what belongs to the horse kind and the ass kind that one should get the cause. In the first place, each of them is one-offspring-bearing from animals of its own kind; next, the females are not always able to conceive from the males (which is why breeders mate horses again at intervals), because they are not continuously capable of bearing.[170] On the contrary, the mare is not [abundantly] menstruous, but among the four-footed animals emits the least.[171]

169. $746^{a}29$–$^{b}11$, $747^{a}31$–33.

170. Reading διὰ τὸ μὴ δύνασθαι συνεχῶς φέρειν.

171. In proportion to size (*HA* $573^{a}11$).

And the female ass is not receptive of mating, but expels the seed with her urine, which is why people follow behind flogging her.[172] Further, the ass is a cold animal, which is why—because its nature is sensitive to cold—it does not readily occur in cold climates, such as Scythia and the bordering region, or among the Celts beyond Iberia; for it is also a cold region. And it is due to this cause that they do not put the jackasses to the females at the equinox, as is done with horses, but around the summer solstice, in order that the foals may be born in a warm season; for the season they are born in is the same as the one in which mating occurs; for both the horse and the ass are pregnant for a year. And because, as was just said, its nature is cold, it is necessary for the semen of an animal of this sort to be cold as well. A sign of this is that, because of it, if a horse mounts a mare that has already mated with an ass, he does not destroy the result of the ass's mating, but if the ass mounts second, he does destroy that of the horse, due to the coldness of his own seed. When, then, they have sexual intercourse with each other the result is preserved by the heat of one of the two of them; for what is secreted by the horse is hotter; for both the matter and the semen of the mule are cold, while those of the horse are hotter. And when hot is mixed with cold or cold with hot, the result is that the embryo that comes to be from them is preserved and they are fertile from each other, while what comes to be from them is no longer fertile, but is infertile as regards generating complete offspring.

In general, each of the two is naturally well-disposed to infertility, for the other things mentioned[173] belong to the ass, and in addition if it does not begin to generate after the first shedding of teeth,[174] it no longer generates at all, so close does the body of the ass come to being infertile. It is the same way with the horse; for it is naturally well-disposed to infertility, and all that remains to make it infertile is for [the semen] from it to become colder. And this comes about when it is mixed with the secretion of the ass. And in the same way the ass, should it copulate with its own, comes equally close to generating something infertile, so that when in addition copulation occurs contrary to nature (if at the same time asses are capable only with difficulty of generating a single offspring from each other), what comes to be from the pair, being yet more infertile and contrary to nature, will need nothing [else] to make it infertile, but will of necessity be infertile.

It results too that the bodies of the female mules become large in size, because the secretion that goes to the menses is diverted to growth. And since the pregnancy in animals of this sort lasts a year, the female mule must not only conceive but also nourish [the embryo], and this is impossible if menses do not occur. But in the female mules none occur, instead, the useless part [of the nourishment] is excreted with the residue that comes from the bladder (which is why the male mules do not even smell at the sexual parts of the female as the other solid-hoofed animals do), while the other

172. *HA* 577a21–24.
173. Paucity of menses, expulsion of semen with urine, and a cold nature.
174. At thirty months (*HA* 577a18).

parts are diverted to the growth of the body and to size. So, while it is sometimes possible for the female to conceive (which is precisely what it appears has already happened), for her to nourish [the embryo] to the end and bring to birth is impossible.

The male, for his part, may sometimes generate, both because the male is hotter by nature than the female and because the male contributes no body at all to the mixture. And the complete thing that comes to be is a ginnus,[175] which is a deformed mule; for the ginni also come to be from the horse and the ass when the embryo gets diseased in the uterus. For the ginnus is like the runts in pigs; for there too what is deformed in the uterus is called a "runt" and any random piglet may come to be of this sort. And human dwarfs come to be in a similar way; for they are deformed, both in their parts and their development, during pregnancy, and are like runts and ginni.

BOOK 3

3.1
The Birds (1): Wind-Eggs; the White and the Yellow

The sterility of mules has now been spoken about as have the animals that are live-bearing both externally and internally. In the egg-laying blooded ones, things having to do with generation proceed in much the same way as those in animals that walk and one must grasp the same thing about them all, although in another way they exhibit differences both in relation to each other and in relation to the animals that walk.

All of them alike, then, come to be from copulation and the emission of male semen into the female. But among the egg-laying ones, the birds emit a complete hard-skinned egg, unless it is deformed by disease, and the eggs of birds are all two-colored. The selachian fishes, as has often been said, after being internally egg-laying, are live-bearing, the egg changing previously from one place in the uterus to another, and their egg is soft-skinned and single-colored. One alone of these is not internally egg-laying, the one called the "fishing frog."[176] The cause of this will be spoken about later.[177] All the other fishes that are egg-laying emit an egg of one color only, but it is incomplete; for it gets its growth outside due to the same cause that the eggs completed inside also do.

Their uteruses, the differences they exhibit, and due to what causes, have been spoken about previously.[178] For in fact some of the egg-laying ones have the uterus high up near the diaphragm, while others have it low down near the sexual parts.

175. The offspring of a mule and a mare (*HA* $577^{b}21$).
176. *HA* $487^{a}27$.
177. $754^{a}25$–31.
178. 1.3.

The selachian fishes have it high up; the ones that are both internally and externally live-bearing (for example, the human being, the horse, and each of the others of this sort) have it low down; and, among the egg-laying ones, it is sometimes low down (as in the egg-laying fishes), sometimes high up (as in the birds).

Fetuses also get composed in birds spontaneously, the ones some people call "wind-eggs" and *zephuria*.[179] These come to be in the ones that are neither flyers nor crook-taloned, but prolific, due to the large quantity of residue these have (in the crook-taloned ones, on the other hand, this sort of secretion is diverted to the wings and wing-feathers, and they have a small body that is dry and hot), and menstrual secretion and semen are residues. Since then both the nature of the wings and that of the seed come to be from residues, nature is incapable of yielding much for both. And it is due to this same cause that the crook-taloned birds neither mate frequently nor are prolific, while the heavy birds and the flyers that have bulky bodies are prolific, like the common pigeon and those of this sort. For in those birds that are heavy and are non-flyers—for example, the chickens, the partridges, and the others of this sort—much residue of the relevant sort comes to be. And this is why their males mate frequently and their females emit much matter, and some of this sort lay many eggs, while others do so often—for example, the chicken, the partridge, and the Libyan ostrich[180] lay many, while the pigeon family lay not many but often; for these are intermediate between the crook-taloned birds and the heavy ones; for they are flyers like the crook-taloned ones, and have magnitude of body like the heavy ones. So, because they are flyers and the residue is diverted to there, they lay few eggs, but because of the size of their bodies and because of the heat their stomach possesses and its very great capacity for concoction, and in addition because they easily get nourishment, while the crook-taloned ones do so with difficulty, they lay them often.

The small birds too mate frequently and are prolific, just as sometimes the small plants are; for what is for the growth of their body becomes spermatic residue. That is why the Adriatic chickens[181] lay the most eggs. For because of the smallness of their body the nourishment is used up for procreation. Also, the ones not true to their stock lay more eggs than those true to their stock; for their bodies are more liquid and more bulky, while those of the latter sort are leaner and drier; for the spirit that is true to its stock comes about more [often] in bodies of this sort. Further, the thinness and weakness of the legs contribute to the nature of this sort of bird being to mate frequently and be prolific, just as in the case of the human beings; for in animals of this sort the nourishment for the legs is diverted to the spermatic residue; for what nature subtracts from one place, it adds at another. The crook-taloned birds, on the other hand, have a strong foot and their legs are thick due to their [way of] life, so that, due to all these causes, they neither mate frequently nor are prolific. The

179. Wind-eggs produced in spring (*HA* 560ª6).
180. *PA* 4.14.
181. *HA* 558ᵇ16–17.

kestrel, however, is the most prolific; for pretty much alone among the crook-taloned birds it drinks, and the liquid, both innate and taken in, is productive of seed when combined with the heat that is present in the kestrel. But it does not lay very many eggs either, but rather four at the most.

The cuckoo, though not a crook-taloned bird, lays few eggs, because its nature is cold (as the cowardice of the bird makes clear), while a spermatic animal must be hot and liquid. That it is cowardly is evident; for it is chased away by all birds and lays its eggs in the nests of others.

Birds of the pigeon family are generally in the habit of laying two eggs. For they neither lay one egg (for no bird lays one egg except the cuckoo, and it sometimes lays two) nor many eggs, but often lay two or at the most three, generally two; for these numbers are intermediate between one and many.

That the nourishment in those that lay many eggs is diverted to the seed is evident from the facts. For most trees, if they bear too much fruit, dry up after the crop, when nourishment is not left over for their bodies, and this is how the annuals seem to be affected—for example, the legumes, wheat, and the others of this sort; for they use up all the nourishment for seed; for they are of the abundant-seed kind. And some chickens, after having laid very many eggs, even laying two eggs in a day, have died after the laying of so many. For they become exhausted, and this applies to both the plants and the birds; and this affection is an excess excretion of residue. And an affection of this sort is also the cause of the later infertility of the lioness; for at first she gives birth to five or six cubs, then in the next year four, and again three, then the next number down to one, then none at all, suggesting that the residue is being used up and that at the same time as the seed is withering the life is abating.

In which birds wind-eggs occur, further, what sorts lay many eggs and what sorts **750^{b}1** few eggs, and due to what causes, has now been stated.

Wind-eggs occur, as was also said previously,[182] because, while the spermatic matter is present in the female, in the birds the secretion of menses does not occur, as it does in the blooded live-bearing ones; for in all those of the latter sort it does occur, more in some, less in others, and in some just enough to show signs of it. Similarly, it does not occur in the fishes either, any more than in the birds; which is why in the fishes as well [as in the birds], without mating, a composition of embryos occurs, although less noticeably; for their nature is colder. The secretion corresponding to the menses in the egg-laying animals occurs in the birds at the times appropriate for the residue, and as the place near the diaphragm is hot, the [eggs] are completed in respect of size, but both these bird ones and those of the fishes alike are, without the semen of the male, incomplete for purposes of generation. The cause of these things was stated previously.[183]

182. 741^{a}16–32, 749^{a}34–^{b}3.
183. 2.5.

Wind-eggs do not occur, however, in the birds that are flyers, due to the very same cause as the one due to which they do not lay many eggs either; for in the crook-taloned birds the residue is small in amount, and they need the male to provide the impulse for the excretion of the residue. The wind-eggs occur in greater numbers than the fertilized eggs, but are smaller in size, due to one and the same cause; for because they are incomplete, they are smaller in size, and because they are smaller in size, they are greater in number. They are less pleasant to eat because they are more unconcocted; for in all cases what is concocted is sweeter.

That, then, neither the eggs of the birds nor those of the fishes are complete for purposes of generation without the male has been sufficiently observed, but as regards embryos that come to be without males in the fishes, it has not been observed to a similar extent, but has been observed most in the case of the river fishes; for some manifestly have eggs from the outset, as is recorded about them in the *History of Animals*.[184] Generally speaking, at any rate, in the birds, even the eggs that come to be through mating are, for the most part, not naturally disposed to get growth if the hen is not mated continually. The cause of this is that just as in the case of women, having sex with men draws down the womanly secretion (for when the uterus has been heated it draws the liquid and the ducts are opened up), so this also happens in the case of the birds, advancing the menses-like residue a little at a time. It is not secreted externally because of the smallness of amount and because the uterus is high up near the diaphragm, but trickles down and collects in the uterus itself. For this will make the egg grow—just as the embryos of the live-bearing animals are made to grow through the umbilical cord—through flowing on the inner surface of the uterus, since, when the hens have been mated once, they pretty much all continue to have eggs, though altogether small ones.

That is why some people are in the habit of speaking of wind-eggs as not occurring [without the male] either, but as being leftovers from previous matings. But this is false; for it has been sufficiently observed both in the case of newborn chicks and geese that wind-eggs occur without mating. Further, female partridges, both those that are unmated and those that have been mated, when taken out to act as decoys, smell the male and hear his call, the first lot become full of eggs, while the second lay them at once. The cause of the affection is precisely the same as the one in the case of the human beings and the four-footed animals; for if their bodies happen to be in heat for sexual intercourse, some emit seed at the sight [of a female], others at the occurrence of a slight touch. The nature of the birds of this sort is to mate frequently and have abundant seed, so that the movement they need is small when they happen to be in heat, and the excretion takes place quickly in them, so that wind-eggs are composed in the unmated ones, while in those that have been mated the eggs grow and are completed quickly.

184. 567ᵃ30–31.

Among the externally egg-laying animals, the birds emit an egg that is complete, the fishes one that is incomplete, but that gets its growth outside [the mother], as was also said previously.[185] The cause of this is that the fish kind is prolific. But it is impossible for a large number of eggs to reach completion inside [the mother], which is why they are laid outside. Their emission is quickly effected; for in the externally egg-laying fishes the uterus is near the sexual parts.

While the eggs of the birds are two-colored, those of all the fishes are single-colored. One may observe the cause of their being two-colored from the capacities of each of their parts, that of the white and of the yellow. For the secretion comes to be from the blood (for no bloodless animal lays eggs), and that blood is the matter for bodies has often been stated.[186] The one part, then, is nearer the shape of what is coming to be, namely, the hot; the more earthen part, by contrast, supplies consistency for its body and is further away [from the shape]. That is why in all two-colored eggs the animal gets the starting-point of generation from the white (for the soul-involving starting-point is in the hot), but its nourishment from the yellow. In animals with a hotter nature the part from which the starting-point comes to be is set apart and separate from the one from which nourishment derives, the first being white, the second yellow, and there is always more of the white and pure than of the yellow and earthen.

But in those that are less hot and more liquid, the yellow is more and more liquid. That is precisely what occurs in the case of the marsh birds; for their nature is more liquid and colder than the land birds, so that the eggs of this sort of bird have more of what is called "lecithus" and are less yellow, because the white is less set apart from it. And the egg-laying animals, whose nature is both already cold and yet more liquid (and the fish kind is of this sort), have the white not set apart at all, both because of the smallness [of the eggs] and because of the quantity of cold and earthen material. (That is why all the fishes' eggs are single-colored, and are white as compared with yellow, yellow as compared with white.) Even the wind-eggs of the birds have this double coloring; for they contain that from which will come each of the two parts (both the one from which the starting-point comes and the one from which the nourishment does), although these are incomplete and have need of the male in addition; for wind-eggs become fertile if [the female] is mated with the male within a certain period of time. The cause of the double coloring, however, is not the male and the female (as if the white came from the male and the yellow from the female)—on the contrary, both come from the female, but the latter is cold and the former hot. In those cases, then, in which there is much of the hot, it is set apart, but when there is little, it cannot be. That is why the embryos of animals of this sort are single-colored, as was said.[187]

185. $749^{a}25–27$.
186. E.g., $740^{b}34–35$.
187. $751^{b}10–20$.

The semen alone composes them. And that is why an embryo in the birds first appears white and small, but all yellow as it advances, and more bloodlike material is continually mixed with it. In the end, as the hot is set apart, the white takes up a position all around it, equally distributed on all sides, as when a liquid boils [some-
752a1 thing]; for the white is by nature liquid and has within itself the soul-involving heat. That is why it is set apart all around, while the yellow and earthen part is inside. And if one pours together many eggs into a bladder or something of that sort and boils
5 them by means of a fire that does not make the movement of the heat faster than the disaggregation within the eggs, then just as in one egg, so too in the whole composed of all the eggs, the yellow comes to be in the middle, the white around it.

Why some eggs are single-colored, then, while others are two-colored, has now been stated.

3.2
The Birds (2): Shape of Eggs; Growth of Eggs; Brooding; Umbilical Cords

10 The starting-point coming from the male is set apart in eggs at the place where the egg is attached to the uterus, and a two-colored egg then becomes non-symmetrical, that is, not altogether round, but rather sharper at one of the two ends, because it is necessary to make the white, in which the starting-point resides, different [from the rest]. That is why the egg is harder at that point than below; for it is necessary to
15 shelter and safeguard the starting-point. And because of this the sharp end of the egg emerges later; for the part attached [to the uterus] emerges later, the egg is attached at the starting-point, and the starting-point is in the sharp end. It is the same way too in the seeds of plants; for the starting-point of the seed is attached in some cases to
20 the branch, in some to the husk, and in others to the seedcase. This is clear in the case of the leguminous plants; for the point at which the two valves of beans and seeds of this sort make contact is where the seed is attached; and the starting-point of the seed is there.[188]

Someone might raise a puzzle, however, about the growth of the egg, as to what way it comes about from the uterus. For if animals get their nourishment through
25 the umbilical cord, what do eggs get it through—since they do not, like larvae, get their growth through themselves? And if there is something through which they are attached [to the uterus], where does it go when the egg has reached completion? For it does not emerge with the egg, as the umbilical cord does in the case of animals;
30 for when it has reached completion, its surface envelope becomes a shell. The puzzle stated, then, is correctly inquired about. But [the one who raises it] fails to consider the fact that when the shell first comes to be it is a soft membrane, while, when it has reached completion, it becomes hard and brittle, but in such a measured way

188. *Juv.* 468b18–23.

that when it emerges it is still soft (for otherwise laying the egg would cause pain), though when it has emerged, it immediately solidifies when it has cooled, the liquid evaporating quickly because there is very little of it, leaving the earthen material behind. Part of this membrane, then, is at the start like an umbilical cord at the sharp **752ᵇ1** end, and projects, while the egg is still small, like a pipe. It is visible in small aborted eggs; for if, being wet through or chilled in some other way, the bird ejects the egg [too soon], the embryo appears still bloody and with a small tail running through it like an umbilical cord. As the egg becomes larger, this becomes more twisted around and becomes smaller. And when the egg has reached completion, the sharp end of the egg [is where] this comes to its limit. Underneath this is the inner membrane which divides the white and the yellow from it. When the egg has reached completion, the whole egg is released and the umbilical cord is reasonably not visible; for it is the last extremity of the egg itself.

Delivery, however, occurs in a contrary way with eggs than with the offspring of live-bearing animals; for, with the latter, it is head and starting-point down, while with an egg the delivery is, as it were, feet down. And the cause of this is the one that was stated,[189] that the egg is fastened at the starting-point.

Generation from an egg comes about in the birds due to the mother bird's brooding and helping the concoction, with the animal being set apart from a part of the egg, while it gets its growth and completion from the remaining part; for nature puts in the egg both the matter for the animal and sufficient nourishment for its growth; for, since the mother bird is not capable of completing the egg within herself, she composes the nourishment in the egg along with it. For while in the case of the live-bearing animals the nourishment (which is called "milk") occurs in a different part (the breasts), in the case of the birds, nature produces it within the eggs—in the contrary way, however, to the one people think and Alcmaeon of Croton states. For it is not the white that is the milk but rather the yellow; for this is the nourishment for the newborn chicks, while they think it is the white because of the similarity of color.

The newborn chick, then, as was said,[190] comes to be due to the mother bird's brooding. But if the season is well blended[191] or if the place in which they are situated is sunny, the eggs get completely concocted, both those of the birds and those of the egg-laying four-footed animals—for all of the latter lay their eggs on the ground, where they get concocted with the help of the heat of the earth, and whichever of the egg-laying four-footed animals visit their eggs and brood on them do so more for the sake of safeguarding them.

Both the eggs of the birds and those of the four-footed animals turn out the same way; for they are both hard-skinned and two-colored, and are composed near the **753ᵃ1** diaphragm just like those of the birds, and all the other things occur in the same

189. 752ᵃ10–18.
190. 752ᵇ15–17.
191. I.e., temperate.

ways both internally and externally, so that the theoretical knowledge of the causes is the same for all of them. But while the eggs of the four-footed animals, because of their strength, get completely concocted due to the season, those of the birds are more vulnerable and need the mother. It seems that nature too tends to establish [in animals] a perception-based capacity for taking care of the young. In the inferior animals this capacity implanted by nature lasts till the latter's birth; in others till their complete development too; and in those that are more practically wise even till they are brought up. In those, then, that have the greatest share in practical wisdom, there is intimacy and love toward them even after they have completely developed, as in the case of the human beings and some of the four-footed animals. But in the birds the capacity lasts until they have borne the chicks and brought them up. That is why females that do not brood when they have laid the eggs get into worse condition, as if they have been deprived of things that are naturally a part of them.

The animal reaches completion more quickly within the egg during sunny days; for the season contributes to the work; for concoction too is [a sort] of heat. And, indeed, the earth helps concoct them with its heat, and the brooding female does this same thing; for she infuses [into them] the heat that is within herself. And the eggs get ruined and become so-called *ouria* more often in the hot season—and reasonably so; for just as wines sour during sunny periods because the sediment gets stirred up (for this is the cause of their being ruined), in the eggs the yolk does. For what gets stirred up is the earthen material in both of them—which is also why wine becomes turbid when the sediment mixes with it, and the eggs become ruined when the yolk does so [with the white].

In the case, then, of the birds that lay many eggs this sort of thing occurs reasonably (for it is not easy to assign the fitting amount of heat to all, but some will get too little and others too much, making them turbid and, as it were, putrefying). But in the crook-taloned birds, though they lay few eggs, this occurs to no less an extent; for often in fact one of a pair becomes rotten, and the third (one might almost say) always does; for their nature being hot they make the liquid in the eggs to boil over, as it were. For of course the yellow and the white are of a contrary nature too. For the
753b1 yellow gets coarse-grained in frosts but liquifies when heated. That is why, when concocted in the earth or due to brooding, it liquifies, and when it is of this sort, it becomes nourishment for the animals being composed. When exposed to fire and baked, it does not become hard, because its nature is to be earthen in the way wax is. And because of this, when [the eggs] are heated more,[192] they turn serous and become rotten. The white, on the other hand, does not become coarse-grained due to frosts, but liquifies (the cause has been stated previously), while when exposed to fire it becomes solid. That is why, in fact, when it is concocted in connection with the generation of animals it becomes coarse-grained. For it is from this that the animal is composed, while the yellow becomes nourishment, and the parts, as they are serially

192. Omitting ἐὰν ᾖ μὴ ἐξ ὑγροῦ περιττώματος.

composed, get their growth from there. That is why too the yellow and the white are distinct and kept separate by membranes, as each having a distinct nature.

The exact way these parts stand to each other, both at the start of generation and during the composition of the animal, and further as regards the membranes and umbilical cords, one must observe with the help of what is written in the *History of Animals*.[193] But for the present investigation it is enough for this much to be evident, that when the heart has been first composed and the great blood vessel has been marked off from it, two umbilical cords extend from this blood vessel, one to the membrane that encompasses the yellow, the other to the chorion-like membrane that encompasses the animal like a circle, and thus it goes around the membrane of the shell. Through one of the two cords the embryo gets the nourishment from the yellow, while the yellow becomes larger; for it becomes more liquid when it is heated. For the nourishment, which is corporeal, needs to be liquid, just as it does for plants, and both the things that come to be in eggs and those that do so in animals at first live a plant's life; for they get their first growth and nourishment from something by growing from it.

The other umbilical cord extends to the encompassing chorion. For in the case of the animals born from eggs, we must suppose them to stand in the same relation to the yellow as the live-born embryo does to the mother, when they are within the mother (for since the ones born from eggs are not being nourished in the mother, they take some part of it[194]), while its relation to the outermost membrane—the one that is bloody—is like that of the live-born one to the uterus. At the same time, the egg shell of the egg that grows around both the yellow and the chorion is the analog of the uterus, as if one were to put one around both the [live-born] embryo itself and around the whole mother. It is this way because the embryo must be in the uterus, that is, in contact with the mother. In the live-bearing animals, in fact, the uterus is within the mother, but in the egg-laying ones it is the reverse, as if one were to say that the mother is within the uterus; for what comes to be from the mother—the nourishment—is the yellow. And the cause is that the nourishing is not within the mother.

In the process of growing, the umbilical cord going to the chorion collapses first, because it is where the animal is to emerge, while the rest of the yellow and the umbilical cord going to the yellow do so later; for what has come to be must have nourishment from the outset; for it is neither nursed by its mother nor capable from the outset of providing nourishment by itself. That is why the yellow goes inside it along with the umbilical cord and the flesh grows around it.

The ones, then, that come to be outside from complete eggs come to be in this way both in the case of the birds and in that of the four-footed animals that lay a

193. *HA* 6.3.
194. The yolk.

hard-skinned egg. These things are clearer in the larger animals; for in the smaller ones they are non-apparent because of how small their dimensions are.

3.3
The Fishes (1): The Selachians

Further, the fish kind is egg-laying. Among these, the ones that have the uterus low down lay an incomplete egg, due to the cause stated previously, while the so-called selachian fishes lay a complete egg internally, though they are externally live-bearing, with one exception, the so-called fishing frog, which alone lays a complete egg externally. The cause of this is the nature of its body; for its head is many times as large as the rest of its body and is spiny and very rough. That is why it neither takes its young in again afterward nor is live-bearing from the start;[195] for just as the size and roughness of the head prevents their coming in, in the same way it prevents their emerging. But since the egg of the selachians is soft-skinned (for they are incapable of hardening and drying its surface envelope; for they are colder than the birds are), only the egg of the fishing frog is solid and firm so as to be preserved outside, while those of the others are wet and soft in nature; for they are sheltered within and by the body of the mother.

754b1 The process of generation from the egg both for the fishing frogs, which are completed externally, and for the ones completed inside is the same, and in these it is partly similar to and partly different from the ones in the birds. For first they do not have the other umbilical cord which extends to the chorion that is under the encompassing shell. The cause of this is that they do not have the surrounding shell; for it is of no use to them (for the mother shelters them), while a shell is a defense against external harms for eggs that are laid outside. Second, the process of generation is from the extremity of the egg in these as well, but not [as in the birds] at the place where it is attached to the uterus; for birds come to be from the sharp end, and this is where the egg was attached. The cause is that the egg of the birds is separated from the uterus, while the egg, not of all but of most of these sorts of fishes, stays attached to the uterus when complete. And when the young animal comes to be at the extremity, the egg gets used up, just as in the case of the birds and the others that are detached [from the uterus], and in the end the umbilical cord remains attached to the uterus of those that are by this time complete. It is likewise too with those selachians whose eggs get detached from the uterus; for in some of them the egg is detached when it has become complete.

One might raise a puzzle, then, as to why the process of generation in the birds and in fishes differs in this respect. The cause is that in the eggs of the birds the white and the yellow are separate, while those of the fishes are single-colored, and what is of

195. *HA* 565b23–31.

this sort is mixed together throughout, so that there is nothing to prevent them from having the starting-point be from the contrary end; for it is not only at the point of attachment that it is of this mixed sort, but also at the opposite one, and it is easier to draw the nourishment from the uterus by means of certain ducts coming from this starting-point. This is clear in the case of the eggs that are not detached; for in some of the selachians the egg is not detached from the uterus, but rather stays connected as it is displaced downward for purposes of live-bearing; in these cases, when the animal is completed it retains the umbilical cord coming from the uterus after the egg has been consumed. It is evident, then, that previously too, while the egg was still around it, the ducts extended to the uterus. This occurs, as we have said, in the smooth sharks.[196]

The process of generation in the birds differs in these respects from that of the fishes, then, and does so due to the causes just stated. But in the other respects it occurs in the same way; for they have the other umbilical cord in the same way, as the birds have it going to the yellow, so the fishes have it going to the whole egg (for it is not the case that part of it is white and part yellow but rather it is all single-colored), and they get their nourishment from it, and as it gets used up the flesh likewise comes and grows around it.

3.4
The Fishes (2): Non-selachians

As regards the fishes that lay a complete egg within themselves but are externally egg-laying, then, this is the way their process of generation proceeds. Most of the other fishes, by contrast, are externally egg-laying, with all except the fishing frog laying an incomplete egg—the cause of this was stated earlier.[197] And of the others' laying incomplete eggs the cause has also been stated.[198]

In the case of these too the process of generation from an egg proceeds in the same way as the one in the case of the internally egg-laying selachians, except that their growth is quick, from small things, and the extremity of the egg is harder. The growth of the egg is similar to that of larvae; for those animals that give birth to larvae also give birth to something small at first, which grows due to itself and not due to any attachment at all. The cause of this is much the same as the one in the case of yeast; for yeast too from being small becomes large as the more solid part liquifies while the liquid part becomes pneumaticized. What crafts this in living things is the nature of the soul-involving heat, and within yeast is the heat of the humor blended with it. The eggs, then, though they grow of necessity due to this cause (for they contain a yeast-like residue), also do so for the sake of the better; for it is impossible for them

196. *HA* $565^{b}2$–17.
197. $754^{a}26$–31.
198. $718^{b}5$–15.

to get the whole of their growth in the uterus because these animals lay so many eggs. It is because of this indeed that they are altogether small when they are secreted and get their growth quickly: small—because of the narrowness of the uterus in relation to the quantity of eggs; quickly growing—in order that their kind not be destroyed because of spending a lot of time during the process of generation on growth, since even as things stand most of the embryos that are laid externally are destroyed. That is why the fish kind is prolific; for nature fights back against destruction by the quantity. And there are some fishes—for example, the one called *belonê*[199]—that burst because of the size of their eggs; for the embryos it holds are large instead of many; for what nature subtracts from quantity it adds to size.

That there is growth of these sorts of eggs, then, and also what cause it is due to, has now been stated.

3.5
The Fishes (3): Erroneous Theories of Mating

A sign that these fishes too are egg-laying is that even the live-bearing fishes, such as the selachians, are first internally egg-laying; for [then] it is clear that the whole fish kind is egg-laying. However, none of these sorts of eggs reaches completion—where there is a female and a male and they come to be from mating—unless the male sprinkles his seminal fluid on them.

There are some who say that all fishes are females except selachian ones, but this is not correctly stated; for they think that the females differ from the ones considered to be males in the same way as in those plants where the one bears fruit and the other is barren—for example, olive, oleaster, fig, caprifig. It is likewise too, they think, with the fishes, except the selachian ones—for they do not dispute the issue in their case. And yet there is no difference with respect to their seminal-fluid-generating parts[200] between selachian males and those in the egg-laying kind; that is, it is evident that seed can be squeezed from both at the proper season. And the females, for their part, also have a uterus. But it should not be only those that lay eggs that have a uterus but also the others, although it should be different from that of the egg-layers, if indeed the whole kind was female, although some of them are infertile (like mules in the kind with long hair in their tails[201]). But as things stand one lot have seminal-fluid-generating parts, the other lot uteruses, and in all except two, erythrinus and channa, the difference is the following one: the ones have seminal-fluid-generating parts, the others have uteruses. And the puzzle because of which they suppose things to be this way is easily resolved by harkening to what happens. For they say correctly

199. One of the "pipefishes," perhaps *Sygnatus acus*, of which the seahorse is another member. *HA* 567[b]21–26.

200. I.e., the spermatic ducts (716[b]17).

201. Reading ὥσπερ αἱ ἡμίονοι ἐν τῷ γένει τῷ τῶν λοφούρων. The kind is *Equus*.

that none of the animals that mate give birth to many offspring; for of those that from themselves generate complete ones, either animals or eggs, none is as prolific as the egg-laying fishes; for the quantity of their eggs is something immense.

But this is what they have overlooked, that the eggs of fishes do not [develop] in the same way as those of the birds. For the birds, whichever of the four-footed animals are egg-laying, and any of the selachians that are egg-laying, lay a complete egg, and it does not get its growth once it has emerged outside, while the fishes lay an incomplete one, and their eggs do get their growth outside. Further, in the case of the soft-bodied and soft-shelled animals it is the same way, yet these are actually seen copulating, because their copulation lasts a long time. And it is evident in these cases that the one is male, while the other has a uterus. It would be strange too if this [difference in] capacity did not exist in the entire kind, just as in the live-bearing animals one is male, another female. The cause of the ignorance of those who speak in **756^{a}1** the foregoing way is that the differences in the matings of animals and their processes of generation, differences that are of all sorts, are not clear to see. Instead, getting a theoretical grasp on them from a few cases, they think that the same must hold in all of them.

That is also why those who say that conceptions come from the gulping down of [male] seed by the females among the fishes have not understood some things when they speak in this way. For it is at around the same time that both the males have seminal fluid and the females have eggs, and the closer the female is to laying the eggs the more abundant and more liquid the seminal fluid of the males becomes. And just as the growth of the seminal fluid in the male and that of the egg in the female occurs at the same time, so it is too with their emission; for the females do not lay all their eggs at once, but a few at a time, nor do the males emit the seminal fluid at once. And all these things happen in accord with reason; for just as in some cases among the bird kind [a female] holds eggs without impregnation (but few and seldom—rather, most come from mating), so the same occurs in the case of the fishes, but to a lesser extent. And these spontaneous eggs that also occur in both are infertile if they are not sprinkled on by the male (in those kinds of them in which the male exists as well). In the birds, because the eggs are complete on emerging, it is necessary for this to occur while they are still inside; but in fish, because in all cases the eggs are incomplete and get their growth outside, even if no egg within becomes fertile from mating, nonetheless the ones outside are preserved by the sprinkling, and it is there that the seminal fluid of the males is used up. And that is why it comes down [the ducts] in smaller quantities at the same time as the eggs in the females do; for the males always follow along sprinkling seminal fluid on the eggs as they are laid. So there are males and females and all of them mate (unless in some kind the female and the male are not distinct), and without the semen of the male nothing of this [fish] sort comes to be.

What also contributes to the deception is the quickness of copulation among fishes of this sort, so that even many fishermen fail to notice it; for none of them observes something of this sort for the sake of knowledge; but nonetheless their

copulation has been seen. For the fishes mate in the same way as the dolphins, by
756[b]1 placing themselves side to side—that is, those whose tail prevents [another sort of copulation]. But ejaculation in the case of the dolphins takes a longer time, while in the cases of the fishes of this sort it happens quickly. That is why, not seeing it, but seeing the swallowing of the seminal fluid and the eggs, even the fishermen state
5 the simple-minded and oft-repeated account of Herodotus the storyteller,[202] to the effect that the fishes are conceived from the swallowing of seminal fluid, not comprehending that this is impossible. For the duct entered through the mouth goes into
10 the stomach, not into the uterus, and it is necessary for what enters the stomach to become nourishment (for it gets concocted). The uterus, however, is manifestly full of eggs—where did they enter it from?

3.6
Erroneous Theories of Bird Mating; the Trochus and Hyena

It is the same way with the generation of the birds. For there are some who say that the ravens and the ibis have sexual intercourse by mouth, and that, among the four-
15 footed animals, the weasel gives birth by mouth. For both Anaxagoras and certain others among the natural scientists say these things, speaking far too simply and without investigation. As regards the birds, they are deceived on the basis of a deduction, because the mating of ravens is seldom seen, while they are frequently seen
20 communing with each other with their beaks, which is something all the raven-like birds do. This is clear in the case of tame jackdaws.[203] Birds of the pigeon kind do the same thing, but because they also manifestly mate, they have not gained this reputation [for having sexual intercourse by mouth]. But though the raven-like kind
25 is not lecherous (for it is among the ones that lay few eggs), [it does do so,] since even it has been observed to mate. It is a strange thing, however, that these natural scientists do not deduce how the seed enters the uterus through the stomach, since the stomach always concocts whatever comes into it, just as it does nourishment. In fact, even these
30 birds have a uterus, and eggs that are visible near the diaphragm. The weasel too, like other four-footed animals, has a uterus in the same way as them, so how is the fetus going to make its way from the uterus into the mouth? Still, because the weasel gives birth to altogether tiny young, just as the other cloven-hoofed animals—about which
757[a]1 we will speak later[204]—also do, and often carry the newborns in the mouth, this belief[205] has come about.

Also very deceived are those who speak in a simpleminded way about the trochus and the hyena. For many people say that the hyena, and Herodorus of Heraclea says

202. 2.93.
203. *HA* 617[b]16–19.
204. 771[a]21–[b]14.
205. That weasels reproduce orally.

that the trochus,[206] has two sex organs, those of the male and those of the female, and that the trochus impregnates itself, while the hyena impregnates and is impregnated in alternate years. [But this is false,] for the hyena has been seen to have only one sex organ. For in some places there is no scarcity of opportunities to observe them. But hyenas have a line under their tail like the female sex organ.[207] Both the males and the females have this sort of sign, but males are caught more frequently. That is why, on the basis of these non-methodical observations, the belief [about their sex organs] has come about.

But about these things what has just been said is enough.

3.7
Mating of Fishes; Wind-Eggs in the Birds

As regards the generation of the fishes, however, someone might raise a puzzle as to what exactly the cause is due to which among the selachian-like fishes neither the females are seen shedding their embryos nor the males shedding their seminal fluid, while among the non-live-bearing fishes both the females are seen shedding their eggs and the males their seminal fluid. The cause of this is that the selachian-like kind does not, in general, generate much seed; and further, the females have their uterus near the diaphragm. For males differ from the males, and the females from the females, in a similar way; for the selachian kinds are also low-yielding as regards semen. But in the egg-laying ones, the male kind sprinkles its seminal fluid, just as the females lay their eggs, because of their quantity; for they have more seminal fluid than suffices for mating; for nature tends to use up the seminal fluid for helping to grow the eggs, once the female has laid them, rather than in composing them from the start. For as was said in the accounts further back and in the more recent ones,[208] the eggs of the birds are completed internally, those of the fishes externally. For in a certain way the latter are like those that give birth to larvae; for the larvae-generating animals emit an embryo that is yet more incomplete. Completion in both cases, both in that of the eggs of the birds and in those of the fishes, is produced by the male, except that in the case of the birds he does so internally (for they are completed internally), while in those of the fishes he does it externally, because the egg is incomplete when released outside. The result, however, is the same in both cases.

The wind-eggs of the birds become fertile, and those previously fertilized by mating with one kind of male change their nature to that of the later [kind of] mating male. And the eggs of the original male, which do not grow if the mating is interrupted,[209] when he has fertilized them by mating again, get their growth rapidly—not, **757b1**

206. It is not clear what animal is referred to.
207. *HA* 579b19–26.
208. 718b5–27, 755a11–b1.
209. Reading ἀναύξητα ὄντα ἂν διαλείπῃ τὴν ὀχείαν, ὅταν ὀχευθῇ.

however, during all of the time, but if the mating occurs earlier, before the change's occurring that leads to the separation of the white. But in the eggs of fishes, nothing of this sort is determined; instead, the males sprinkle seminal fluid on them quickly to preserve them. The cause of this is that these eggs are not two-colored. That is why a period of time of this sort is not fixed for them as in the case of the birds. And this has come about reasonably; for when the white and the yellow have been set apart from each other, the egg already contains the starting-point that comes from the male (for this is what the male contributes).

Wind-eggs, then, get their generation so far as is possible for them; for it is impossible for them to be completed into an animal (for perception is needed[210]). But both the females and the males—in fact, all the animals—possess the nutritive capacity of the soul, as has often been said.[211] That is why the egg itself, considered as an embryo of a plant, is complete, but, considered as that of an animal, incomplete. If, then, there were no male in their kind, the egg would have been laid as it in fact is in the case of certain fishes—if indeed there is any kind of such a sort as to generate without a male (but about this it was said[212] earlier too that it has not been adequately observed). But as things stand there is a male and a female in all the birds, so that insofar as the egg is a plant it is complete (and that is why it does not change again after being fertilized by mating), but insofar as it is not a plant, it is not complete, nor does anything else result from it; for it has come to be neither simply as a plant nor as an animal from copulation. On the other hand, eggs that come to be from mating that have the white set apart come to be from the first mating; for they already contain both starting-points.[213]

3.8
The Soft-Bodied and Soft-Shelled Animals

The offspring are produced in the same way too by the soft-bodied animals (for example, the cuttlefishes and things of that sort) and by the soft-shelled animals (for example, the crayfish and things of the same kind as these); for they too lay eggs from mating and the copulation of male with female is often seen. That is why those who say that all the fishes are female and lay eggs without mating are not speaking in a way based on methodical inquiry on this point either;[214] for to think that the former animals lay eggs from copulation while the fishes do not is a wondrous thing, while to have been unaware that they do is a sign of lack of experience. The copulation of all

210. 741a10–16.
211. E.g., 740b36–741a3.
212. 741a35–37.
213. Of perceptual soul, from the male; of nutritive soul, from the female.
214. 757a11–12.

these lasts a longer time than of all the others, like that of the insects, as is reasonable; for they are bloodless, which is why their nature is cold.

In cuttlefishes and calamaries the eggs appear to be two, because the uterus is divided and appears cloven, while of octopuses there appears to be one egg. The cause is that the shape is visibly round in form and spherical; for the cleavage is invisible when it is filled [with eggs]. The uterus of the crayfish is also cloven. All these animals also give birth to an incomplete embryo, and due to the same cause. The female crayfishes release their offspring onto themselves (that is why the females of these have larger flaps than the males, in order to protect the eggs), while the soft-bodied animals do so away from themselves. The male of the soft-bodied animals sprinkles [his seminal fluid] over the females just as male fishes do over the eggs, which become continuous and viscous. But in the crayfish-like animals something of this sort is neither seen nor reasonable; for the embryo is under the female and is hard-skinned. Both these [eggs] and those of the soft-bodied animals get their growth outside, just as those of the fishes do.

While coming to be, the cuttlefish [embryo] is attached to the eggs at its front part; for it is possible only here; for the cuttlefish alone has its front part and back part facing in the same direction. One must observe the mode of the configuration of its position while it is coming to be with the help of the *History of Animals*.[215]

3.9
The Insects

The generation of the other animals—those that walk, fly, and swim—has now been spoken about. In accord with the methodical inquiry we are following, the insects and hard-shelled animals must next be spoken about. Let us first speak, then, about the insects.

That some of these come to be from copulation, others spontaneously, was said previously,[216] and in addition that they give birth to larvae, and due to what cause they give birth to larvae. For pretty much all animals seem in a certain way to give birth to larvae at first; for the most incomplete embryo is of this sort; and in all animals, even the live-bearing ones and the egg-laying ones that produce a complete egg, it is by being at first indistinct that the embryo gets its growth. And the nature of the larva is of this sort. After this, some of the egg-laying animals generate a complete embryo, others an incomplete one, but it becomes complete outside, as has often been said[217] to be so in the case of fish. In the internally live-bearing animals, however, after its composition at the start, the embryo becomes in a certain way egg-like; for the liquid is encompassed by a thin membrane, as if someone were to take the **$758^{b}1$**

215. $550^{a}10–32$.
216. $721^{a}5–16$, $732^{b}10–14$, $733^{a}24–32$.
217. E.g., $749^{a}24–27$.

shell off eggs. That is why people call the "destruction" of embryos occurring at that time "effluxions."[218]

The insects that generate, generate larvae, and those that come to be not through copulation but spontaneously, come to be at first from a composition of this sort. For one must suppose caterpillars to be a certain form of larva too, also what comes from spiders. And yet some even of these and many of the others seem to be like eggs because of their round configuration. We must not speak by referring to their configuration, however, or to their softness and hardness (for the embryos of some of them are hard), but to the fact that the whole animal changes and does not come to be from [just] a certain part.[219]

All these larva-like things having emerged, and having reached the end of their growth in magnitude, come to be a sort of egg; for the sheath around them hardens and they are immobile during this period. This is clear in the case of the larvae of the bees, the wasps, and the caterpillars. The cause of this is that their nature, because of its incompleteness, lays eggs, as it were, before the proper time, as if the larva, while still in the process of growing, were a soft egg. It happens in the same way too in the case of all the others that come to be, not from mating, in wool or other such materials and in water.[220] For all of them, after their larva-like nature, become immobile and their sheath dries around them, and after this the sheath bursts and there emerges, as from an egg, an animal that has achieved completion at its third process of generation.[221] Among these, the winged ones are larger than those that walk.

Another occurrence, though in accord with reason, would also justly be a cause of wonder to many people; for the caterpillars at first get nourishment, but after that they no longer get it, and what are called "chrysalises" by some people are immobile, and the larvae of the wasps and the bees[, which take nourishment and contain visible excrement,[222]] after they become what are called "pupae," have nothing of this sort. For the nature of eggs too, when it has reached its end, is non-growing, but at first it grows and takes nourishment until it has become distinct and a complete egg has come to be. Among larvae, some contain within themselves the sort of thing from which, as they are nourished by it, this sort of residue[223] occurs—for example, those of the bees and the wasps, while others get it from outside, as the caterpillars and certain other larvae do.

Why, then, the coming to be of things of this sort occurs in three stages, and due to what cause from having been moving they become immobile again, has been stated. And some of them come to be from mating, as the birds, the live-bearing

218. *HA* 583ᵇ11–12.

223. I.e., the excrement.

animals, and most of the fishes do, while others come to be spontaneously, as some of the plants do.[224]

3.10
The Bees

The generation process of the bees involves much puzzlement. For if indeed it is a fact that in the case of some of the fishes there is a process of generation that generates without mating, the same seems likely to happen with the bees, judging from things that seem to be the case. For it is necessary for them either to bring the seed[225] from elsewhere (as some people say)—in which case it must either be something that grows spontaneously or that some other animal gives birth to—or to generate it themselves, or to bring some and generate others (for some people also say this, on the supposition that they bring only the seed of the drones). Again, if they do generate them, they do so either by mating or without mating. And if by mating, either each kind must generate its own kind or one kind must generate the others, or one kind by copulating with another—I mean, for example, bees from copulating bees, drones from drones, kings from kings, or all the others from one (for example, from the "kings" and "leaders," as they are called, or from the copulation of drones and bees; for some people say that the drones are males and the bees female, while others say that the bees are male and the drones female).

But all these views are impossible if we deduce things first from facts special to bees, second from those more common to the other animals. For if they do not give birth to the young but bring them from elsewhere, then bees should come to be, even if not brought anywhere by bees, in those places from which they bring the seed. For why when transferred will they come to be, but not do so there? For it is no less fitting for them to do so there, whether they grow in flowers spontaneously or whether some other animal gives birth to them. And if indeed the seed belonged to some other animal, that one should come to be from it, but not bees. Further, that they should collect honey is reasonable (for it is nourishment), but that they should collect seed that belongs to another and is not nourishment is strange. Indeed, for what's sake do they do it? For all the animals that busy themselves about the young work hard for what appears to be their own seed.

But then for the bees to be female and the drones male it is not reasonable either; **$759^{b}1$** for nature does not assign a weapon for strength to any females, but while drones are stingless, all bees have a sting. Nor is the contrary view reasonable, that the bees are male and the drones female; for no males are accustomed to work hard for their young, but as things stand the bees do this. And, in general, since it is evident that

224. $715^{b}25–30$.
225. *HA* $554^{a}21–23$.

the seed of drones comes to be even when there is no drone present, while the seed of bees does not come to be without the kings (which is why some people say that the seed of the drones alone is brought [from outside]), it is clear that they do not come to be from mating, either from each copulating with its own kind, or from bees and drones doing so. (That they should bring the seed of drones alone is impossible because of what was just said. Also, it is not reasonable that a similar affection not be characteristic of the entire kind of these.[226]) But then again it is also impossible for some of the bees themselves to be males and others females. For in all the kinds of animals the female differs from the male. Besides, if that were so, they would generate themselves. But as things stand, it is evident that their seed does not come to be if the leaders[227] are not among them, as they say. An objection jointly against both bees generating from each other and from drones (that is, together with and separate from each other) is that none of them has ever been seen mating, while if there had been female and male among them this would often have happened.

It remains, if indeed bees come to be from mating, for the kings to do the generating by copulating. But it is evident that the drones come to be even in the absence of leaders, and it is not possible either for the bees to bring the seed [of drones] or to generate it themselves by copulating. It remains, then, as appears to be so in the case of certain fishes, that the bees generate the drones without mating, that is, generating them by being female, but containing within themselves, as the plants do, both the female and the male. That is also why they have the instrument for strength. For we should not call something "female" in which the male is not separated. And if in the case of the drones this seems to occur, that is, that they come to be not from mating, it is necessary for the same argument to apply as well to the bees and the kings and that they should come to be not from mating. If, then, the seed of bees had manifestly come to be without the kings, it would have been necessary for the bees to **760ᵃ1** have come to be from themselves without copulation. But as things stand, since this is not what is said by those concerned with the care of these animals, it remains that the kings generate both themselves and the bees.

Because, then, the bee kind appears to be extraordinary and special, so too their process of generation appears to be special. For while generating without mating, as the bees do, may also occur in the case of other animals, not generating the same kind [as them], by contrast, is special; for even the erythrinus generates an erythrinus and the channa a channa. The cause is that bees themselves do not come to be in the same way as flies and animals of this sort, but rather from a distinct, though cognate, kind; for they come to be from the leaders. That is also why their process of generation in a way stands in a proportion;[228] for the leaders are similar to the drones in size, to the bees in having a sting. The bees are like them in this respect, then, and the drones

226. I.e., if drones are brought from outside, bees and kings should be as well, since they do in fact all belong to the same kind.
227. The kings.
228. 760ᵃ34–35.

are like them in size; for it is necessary for there to be some overlapping, unless the same kind must always come from each (but this is impossible; for then the entire kind would be leaders). The bees, then, are similar to them in capacity,[229] the drones in size.

If the drones also had had a sting, they would have been leaders. But as things stand, a puzzle remains; for the leaders are like both kinds at the same time, the bees in having a sting, the drones in size.[230] On the other hand, it is necessary for the rulers also to come to be from something. Since, then, they are neither from the bees nor from the drones, it is necessary for them to generate themselves. And their cells come to be at the end and are not many in number. So what happens is that though the leaders in fact generate themselves, they also generate another kind (that of the bees), and the bees, while they generate another kind (the drones), no longer generate themselves; rather, this has been subtracted from them. And since what is in accord with nature always has an order, because of this it is necessary for drones to have even generating another kind subtracted. And it is evident that this is precisely what happens; for though they are themselves generated, they generate nothing else; instead, the process of generation reaches its limit at number three [in the series].[231]

And so well has nature organized this that the kinds always remain in existence and none of them fails, though not all generate. And it is also reasonable for this to happen. In good years, much honey and many drones come to be, but in wet ones a large quantity of seed generally comes to be. For the wet periods produce more residue in the bodies of the leaders, while the good ones do so in those of the bees; for being smaller in size they need the good weather more. It is well too that the kings, since they have been made for producing offspring, remain inside, relieved from necessary sorts of work, and having magnitude, as the composition of their bodies is for begetting offspring, and that the drones be idle, as they have no weapons for fighting for nourishment, and because of the slowness of their bodies. The bees are intermediate to both (for in this way they are useful for work), and they are workers, as they nourish both their children and their fathers. And it is also in agreement with this that they attend on their kings because their generation is from them (for if nothing of this sort were the case, the facts about their leadership would not have a reason), and while they allow the kings to do no work, as being their parents, they discipline the drones as their children; for it is nobler to discipline children and those for whom there exists no work.

The fact that the leaders, though being few in numbers themselves, generate a large number of bees seems to be much the same as what happens in the generation of lions,[232] which at first generate five, later a smaller number, in the end one, then none at all. And the leaders at first generate a multitude, later a few of themselves

229. Secluding καὶ τῷ τίκτειν.
230. Reading εἰ . . . κηφῆσιν.
231. The three being leaders (kings), bees, and drones.
232. $750^{a}31–^{b}1$.

(the offspring of the latter being smaller), and nature, since it subtracted from their quantity, makes up for it in their size.

On the basis of reason, then, and on the basis of what seem to be the facts about them, matters having to do with generation of bees appear to be this way. The facts have certainly not been sufficiently grasped, but if at some time they are, one should take perception rather than reasonings to be what must carry conviction, and reasonings [only] if what they prove agrees with what appears to be the case.

An additional sign that it does not come to be from mating is the fact that the seed appears small in the cells of the comb, while those insects that come to be from mating copulate for a long time, but give birth to something larva-shaped and having magnitude.[233]

As regards the process of generation of animals of the same kind as bees—for example, the hornets and the wasps—it proceeds in much the same way in all of them, although what is extraordinary has reasonably been subtracted. For they have nothing divine in them as the bee kind does.[234] For the ones called "mother" wasps generate the young and mold together the first [cells] of the combs, but they generate by mating with each other; for their copulation has often been seen. As for how many differences each of these kinds exhibits, either in relation to each other or in relation to the bees, must be observed with the help of what is cataloged in the *History of Animals*.[235]

The process of generation of all the insects, then, having been spoken about, we must now speak about that of the hard-shelled animals.

3.11
The Hard-Shelled Animals

And what has to do with the process of generation of the hard-shelled animals is partly like, and partly not like, that of the others. And this is reasonable; for compared to animals they are like plants, while compared to plants they are like animals, so that in a certain way they appear to come to be from seeds, but in another way not from seeds, and in a way they appear to come to be spontaneously, but in another way from themselves, or some in the latter way, some in the former. Because their nature is a counterpart to that of the plants, no part, or a small part, of the hard-shelled animal kind—for example, the snails and any others of this sort, rare as they are—comes about in the earth; but in the sea and in similar waters there are many and they have every sort of shape. The plant kind, by contrast, is little—that is (one might almost say), not at all—represented in the sea and places of that sort, since all such things come to be on land. And, in fact, their nature stands in a proportion: the

233. This sentence is marked as misplaced.
234. *PA* 648ᵃ3–8.
235. *HA* 9.41.

nature of hard-shelled animals is as far apart from that of plants as the wet's being more characteristic of life is from the dry's and as water's is from earth's, since the hard-shelled animals tend, at any rate, to be related to the wet as plants are related to earth—as if plants were terrestrial shellfishes and shellfishes aquatic plants.

Due to this sort of cause too the animals in what is wet are more multiform than those in earth; for the nature of the wet is more versatile than that of earth, and not much less bodily, and the animals in the sea are most of all of this sort; for fresh water, though sweet and nourishing, is less corporeal and is cold. That is why all bloodless **761ᵇ1** animals whose nature is cold are not found in lakes nor in the fresher among brackish waters, except to a lesser extent (for example, the hard-shelled, the soft-bodied, and the soft-shelled animals; for all of these are bloodless and have a cold nature), while in lagoons and near the mouths of rivers they are found; for they seek at the same time warmth and nourishment, and the sea is both wet and much more corporeal than fresh water, its nature is hot, and it has a share of all the parts, water, breath, and earth, so that it also shares in all the living things that come to be in each of these places. For the plants may be assigned to land, the aquatic animals to water, the terrestrial animals to air. But the more and the less, and nearer and further away, produce a great and wondrous difference. As for the fourth kind, it must not be sought in these places, and yet it certainly wishes to be one corresponding to fire in the order; for it is counted as the fourth of the [elemental] bodies. But fire always appears to have a shape that is not special to it; on the contrary, it is always in another of the bodies; for what is on fire appears to be either air, smoke, or earth.[236] Instead, this fourth kind must be sought on the moon; for the moon appears to participate in [the elemental body] at the fourth remove.[237] But these issues are for another account.[238]

As for the nature of the hard-shelled animals, some are composed spontaneously, some emit [something with] a certain capacity from themselves, but these also often come to be from spontaneous composition. We must, then, grasp the modes of generation of plants.[239] For some of these come to be from seed, some from cuttings that are planted out,[240] others by budding-off—for example, the onion kind. This is the way mussels come to be; for smaller ones are always growing alongside the starting one. But the whelks, the purpuras, and those that are said to make honeycombs[241] emit a mucilaginous liquid that is like one of a spermatic nature. We must, however, consider none of these emissions to be seed, but rather regard these animals as participating in the way just stated in a likeness to the plants. That is why too a large number of such animals come to be when one has come to be. For though it happens that all these animals come to be spontaneously as well, proportionally more do if **762ᵃ1**

236. *GC* 331ᵇ25–26, *PA* 649ᵃ18–22.
237. I.e., fire.
238. No such account is extant.
239. Because hard-shelled animals are like plants (761ᵃ16–17).
240. *Long.* 467ᵃ25–30, *Juv.* 468ᵇ17–18.
241. *HA* 546ᵇ19–21.

some are already composed. For it is reasonable that each have some residue left over from the starting one, from which each of the animals growing alongside it buds off. And since nourishment and its residue have much the same capacity, it is likely that the substance of the comb-makers is like that of the one composed at the start. That is why it is reasonable that they also come to be from it.

The ones that neither bud off nor make combs come to be spontaneously. And it is evident that all those composed in this way, whether in earth or in water, come to be in cooperation with putrefaction and an admixture of rainwater; for as the sweet is disaggregated into the starting-point that is being composed, the residue of the mixture takes this shape; for nothing comes to be by putrefaction but by concoction; for putrefaction, that is, the putrefied thing, is a residue of concoction; for nothing comes to be from the whole of anything, any more than in the case of what is crafted due to craft—for if it did, craft would have nothing to do. But as things stand, in the one case, craft subtracts what is useless, and in the other, nature does.

Animals and plants come to be in earth and in liquid because in earth there is water present and in water breath, and in all breath there is soul-involving heat, so that in a certain way all things are full of soul. That is why they are quickly composed once it has been enclosed. And it gets enclosed and occurs as a foamy bubble when wet bodies heat up. And the differences that determine whether the kind of a thing being composed is more estimable or non-estimable lie in the enclosure of the soul-involving starting-point. Both the places and the body that is enclosed are causes of this. But in the sea there is much earthen material present. That is why it is from such material that the nature of the hard-shelled animals is composed: earthen material hardens all around them, solidified in the same way as bones and horns (for they are unmeltable by fire), and on the inside the body that possesses life is enclosed.

The snail kind is the only one of these sorts of animals that has been seen copulating. But whether their generation is from copulation has not so far been adequately observed.

Anyone wishing to inquire correctly might well ask what corresponds to the **762b1** material starting-point in the composition of animals of this sort. For in females this is a certain residue belonging to the animal, potentially of the same sort as that from which it came, which the starting-point from the male moves and completes into the animal. But here what should one say this sort of thing is, and where does the movement-causing starting-point corresponding to the male come from, and what is it? We must grasp, then, that, even in animals that generate, it is from the incoming nourishment that the heat present in the animal makes the residue, the starting-point of the embryo, by disaggregation and concoction. It is the same way in the case of plants too, except that in these, as in certain of the animals, there is no additional need of the starting-point from the male (for they have it mixed within themselves), while in most animals the residue does need it in addition. For some, the nourishment is water and earth; for others, it is things composed of these, so that what the heat present in animals produces from the nourishment is precisely what

the seasonal environmental heat aggregates and combines from seawater and earth by concoction. And the part of the soul-involving starting-point that is either enclosed or disaggregated in the breath produces an embryo and implants movement in it. The composition of [all] the plants that come to be spontaneously is of the same form; for they come to be from a part, which is for the outgrowths either a starting-point or their first nourishment.[242]

Among the animals, on the other hand, some give birth to larvae, both the bloodless ones that are not produced from animals and among the blooded ones, for example, a certain kind of mullet and of other river fishes, and further the eel kind; for all of these, even though having little blood, have nonetheless a blooded nature, and have a heart, which is the starting-point of the parts, that is sanguineous. And the ones called the "intestines" of earth have a larva's nature, and in these the bodies of the eels come to be. That is why, even as regards the generation of the human beings and the four-footed animals, one might suppose that, if indeed they were really earth-born, as some people say, they came to be in one or another of two ways; for either it is by first being composed as a larva or from eggs. For it is necessary for them either to have within themselves the nourishment for growth (and an embryo of this sort is a larva) or to get it from elsewhere, and this either from the female progenitor or from part of the embryo. So, if the former of the two is impossible, that is, for it to flow from the earth as it does from the mother in the case of other animals, it is necessary to get it from a part of the embryo. And generation of this sort, we say, is from an egg. **$763^{a}1$**

If indeed there was such a starting-point for the generation of all animals, then, that it is reasonable for it to be one or the other of these two is evident. But there is less reason for it to be from eggs; for we see none of this sort of generation of any animal, but we do see the other sort, both in the blooded ones mentioned[243] and in the bloodless ones. Some of the insects are of this sort as are the hard-shelled animals that our account concerns; for they do not come to be from a certain part as the offspring of the egg-laying animals do, and their growth is produced in a similar way to that in larvae. For larvae grow toward the upper part and the starting-point; for the nourishment for the upper parts is in the lower one. And this proceeds in a similar way in those that come from eggs, except that these use up all of it, while in the offspring of larvae-generators, when the upper part has grown from what is composed in the lower part, the lower part gets articulated from what is left over. The cause is that later on also the nourishment occurs in all animals in the part below the diaphragm.

That this is the way the larva-like animals have their growth produced is clear in the case of the bees and animals of this sort; for at the start their lower part is large, while their upper one is small. And, in the case of the hard-shelled animals, matters having to do with growth proceed in the same way. This is also evident in the case

242. $715^{b}27$–30.
243. Mullets and eels ($762^{b}23$–24).

of the spirals of the spiral-shelled animals; for as the animal grows, they always grow larger toward the front and the so-called head.

The way the generation proceeds, then, both of these and of the other animals that come to be spontaneously, has been pretty much stated.

That all the hard-shelled animals are composed spontaneously is evident from such facts as the following. They come to be on the side of boats when the foamy mud putrefies. Also, in many places where previously nothing of this sort existed, when later the place became muddy through a dearth of water the ones called "lagoon" oysters, a sort of hard-shelled animal, come to be. For example, when a naval expedition cast anchor near Rhodes, some clay pots were thrown out into the sea, and as time went on and slimy mud had collected around them, shellfishes used to be found inside them. And a proof that these sorts of animals do not emit anything generative from themselves is this: when certain Chians carried some live shellfishes over from Pyrrha in Lesbos and deposited them in certain Euripus-like places in the sea where currents clash, but though as time passed they greatly increased in size, they became no more numerous. As for their so-called eggs, they contribute nothing to generation, but are [just] a sign of being well nourished, like fat in blooded animals. That is also why for purposes of eating they become well flavored at these periods. A sign [that these are not really eggs] is that these sorts of animals—for example, the pinnae, the whelks, and the purpuras—always have them, except that sometimes they are larger, sometimes smaller. Others have them not always, but rather in the spring, in diminishing quantities as the season advances, and in the end disappearing altogether—for example, the scallops, the mussels, and ones called "lagoon" oysters; for this season is advantageous to their bodies. In others—for example, the sea squirts—nothing of this sort is noticeable.

The particulars concerning these and the places in which they occur must be observed with the help of the *History of Animals*.[244]

BOOK 4

4.1
Causes of Sex Differentiation in the Embryo

The generation of the animals, then, has now been spoken about, both in common and about all of them separately. But since in the most complete of them the female and the male are separated, and since we say that these capacities are the starting-points of all plants and all animals (although some have them unseparated, others separated), we must speak first about the generation of these; for while the

244. 4.4, 5.15, 590[a]18–[b]3.

animals are still incomplete in their kind, the female and the male are distinct. But whether one is female and another male before the difference is clear to perception, the difference being acquired by them in the mother or earlier is disputed.

For some people—for example, Anaxagoras and others among the natural scientists—say that this contrariety is present in the seeds from the outset; for the seed, they say, comes from the male, while the female provides the place, and the male is from the right, and the female from the left, and while males are on the right of the uterus, females are on the left. Others say that it is in the matrix, just as Empedocles does; for the [seeds] that enter a hot womb become males, he says, while those that enter a cold one become females, the cause of the hotness or coldness being the flow of the menses, as it is colder or hotter, older or more recent.

Democritus of Abdera says that the difference of female and male occurs in the mother; nonetheless it is not because of the heat and cold that one becomes female and another male, but rather on whose seed would master whose, that is, the seed that has come from the part by which male and female are differentiated from each other. For Empedocles really made a rather careless assumption in thinking that female and male differ from each other only in coldness and hotness, while seeing that all the parts exhibit the great difference that we meet in male sex organs and the uterus. For if fabricated animals, one having the parts of the female and the other those of the male, were put into the uterus as into an oven, the one having a uterus into a hot one and the one not having it into a cold one, the one not having a uterus will be female, and the one having it will be male. But this is impossible. So, in this respect, what Democritus says is better; for he seeks the difference belonging to this generation [of male and female], and tries to state it—whether he does so correctly or incorrectly is another story.

Moreover, if hotness and coldness were the cause of the difference of the parts, those who speak that way should have stated this; for this (one might almost say) is what speaking about the generation of male and female consists in; for there is a manifest difference between them. And it is no small task, from hotness and coldness as starting-point, to draw conclusions about the generation of the parts, as if it necessarily follows that by the animal's being cooled this part called the "uterus" comes to be, while by its being heated it does not come to be. It is the same way too with the parts that effect sexual intercourse; for these also differ in the way stated previously.[245]

Further, male and female twins[246] are often found together in the same part of the uterus—and this we have adequately observed from dissections in all the egg-laying animals, both in the terrestrial ones and in the fishes. If, then, Empedocles had not seen this, it is reasonable for him to make an error in stating this cause of his. If, on the other hand, he had seen it, it is strange to still consider the cause to be the hotness

245. Especially in 1.2.

246. I.e., all cases in which at least one male and one female embryo is produced in the same part (left or right) of the uterus.

or coldness of the uterus; for, if it were, they would both become female or both male. But as things stand, this is not what we see happening.

He says too that the parts of what comes to be are "torn asunder" (for some are in the male, he says, others in the female, which is also why they have an appetite for sexual intercourse with each other). It is necessary, then, for the magnitude of these parts also to be torn asunder and for an assembly to occur, but not because of cooling and heating. But about this sort of cause for the seed there are no doubt many things to say [in criticism]; for, in general, this manner of cause seems to be fabricated. If, however, the facts about seed are as we have stated, and it does not come from all [parts] nor, in general, does what comes from the male provide any matter whatever to what is coming to be, then one must make a reply to Empedocles, Democritus, and anyone else who speaks in a similar way. For it is not possible for the body of the seed to be torn asunder, part in the female and part in the male, as Empedocles states when he says, "Torn asunder is the nature of the limbs, this part in man's. . . ."[247] Nor is it possible for the totality of it to be secreted from each, and for a female or male to come to be as one part masters another.

In general, it is certainly better to say that the excess of one part, by its mastery, generates a female than, giving thought to nothing, to make heat alone the cause. However, the fact that at the same time the shape of the sex organ is also distinct needs an argument for its always following along with the other.[248] For if it is because they are nearby, then each of the remaining parts should follow along too—for one of the prevailing parts is near another part, so that the offspring, if female, would at the same time be like its mother [in all other respects], or, if male, like its father.

Further, it is also absurd to think that only these parts must come to be, without the whole body changing, and particularly and primarily the blood vessels, around which, as around an outline, the body of the flesh is laid.[249] It is not reasonable that these become of a certain quality because of the uterus, but rather the uterus because of them; for although each is a receptacle for a certain sort of blood, that of the blood vessels is prior.[250] But the movement-producing starting-point is necessarily always prior, and by being of a certain quality is the cause of generation. A difference of these parts in relation to each other in females and males results, then, but it must not be thought of as a starting-point or a cause, but rather something else must, even if no seed is secreted either from the female or from the male, but rather what comes to be is composed in any and every way.

The very same argument may be used against those who say that the male comes from the right and the female from the left as the one used against Empedocles and against Democritus. For if the male contributes no matter at all [to the embryo], those who speak in this way would be saying nothing; but if, as they say, it does

247. B63 DK.
248. I.e., why the uterus and the female external genitalia always go together.
249. 743ᵃ1–2, *HA* 515ᵃ34–35.
250. 740ᵃ17–19.

contribute some, it is necessary to reply in the same way as to Empedocles' argument, which distinguishes the female from the male by the hotness and coldness of the uterus. For their part, they do the same thing [he does] by distinguishing by lefts and rights, while seeing the female and the male also differing by their [sexual] parts as a whole. So, what for them is the cause due to which the body of the uterus exists in those [embryos] that come from the left and not in those that come from the right? For if it were to come [from the left] and not possess this part, it would be a female not possessing a uterus or a male possessing one, as luck would have it. Further, precisely as was also said previously,[251] a female has been seen in the right part of the uterus, a male in the left, and both in the same part, and this not only once but often, or the male one in the right, the female in the left, and no less often both come to be in the right.[252]

In much the same way, certain people who were persuaded by these things said that if the right or left testis is tied up in mating the result is a male offspring or a female offspring, respectively; for in fact Leophanes spoke this way. And in a case where one or other testis is cut out some say that the same happens, not speaking the truth but prophesying about what will happen based on likelihoods and assuming things in advance before seeing how they turn out. Further, they do not know that these parts contribute nothing to the generation of male offspring and female offspring in the animals. A sign of this is that many animals that are themselves both female and male, and generate females and males, do not have testicles, as those not having feet do not—for example, the fish kind and the snake kind.

To think that hotness and coldness are the cause of male and female, or that the secretion coming from the right or from the left is the cause of their coming to be, is reasonable to some extent; for the right side of the body is hotter than the left, and the concocted seed hotter than the unconcocted, and what has been composed is something of this sort, and what has been composed is more fertile. But to speak in this way is to grasp the cause from too far away, and we must most of all move on by all possible means toward the primary causes.[253]

The body as a whole and its parts, what each of them is and what cause it is due to, has been spoken about previously elsewhere.[254] But since the male and the female are distinguished by a certain capacity and a certain incapacity (for what is capable of concocting, composing, and emitting seed containing the starting-point of the form is male—and by "starting-point" I mean not the sort from which as from matter an offspring comes to be that is of the same sort as the progenitor, but rather the primary moving-producing one, whether capable of producing it within itself or in something else), while what is receptive of seed, but incapable of composing and emitting it, is female; further, if all concoction works by heat; then it is necessary for the males of

251. $764^{a}33$–36.
252. Retaining ἤ τὸ ἄρρεν . . . τοῖς δεξιοῖς.
253. I.e., the proximate ones.
254. *PA* 2–4, *GA* 1.

the animals to be hotter than the females. For it is because of coldness and incapacity that the female is more abundant in blood in certain parts. And this is a sign that goes contrary to what some people think is the precise cause due to which the female is hotter than the male: the emission of menses; for blood being hot, what has more is hotter. They suppose, however, that this affection occurs because of an excess of blood and heat, as if it were possible for everything and anything to be equally blood if only it is liquid and sanguineous in color, and not for it to become less in quantity and more pure in quality in those that are better nourished. For them it is as with the residue in the bowel, where more rather than less, they think, is a sign of a hotter nature. And yet it is the contrary; for just as in the workings having to do with wheat,[255] where the nourishment in its first stage is abundant, and in the end the last stage is nothing compared to the quantity in the first stage, so too in the body: the parts receive the nourishment in turn for their work, from the entirety of which the final result is altogether small. In some this is blood, in others, its analog.

Since the one sex is capable and the other incapable of excreting a residue that is pure, then, and for every capacity there is an instrument, the same for the one that completes [its work] in an inferior way as for the one that does so better, and since things are said to be capable and incapable in many ways, and the female and the male are opposed in this one, it is necessary, then, for there to be an instrument both for the female and for the male; for the first the uterus, for the second the penis. And nature assigns to each both the capacity and the instrument together; for it is better that way. That is why each of the places comes to be together with the excretions and the instruments, and just as the sight is not completed without the eye nor the eye without sight, so too the bowel and bladder come to be together with the capacity to generate the residues.

And since it is from the same thing that something both comes to be and grows (and this is the nourishment), each of the parts should come to be from the sort of matter and the sort of residue that it is receptive of. Second, and contrariwise, it comes to be, we say, in some way from its contrary. Third, in addition to these points, we must grasp that if indeed a thing passes away to its contrary, what is not being mastered by what crafts it also necessarily changes to its contrary. From these principles it should presumably already be more evident what the cause is due to which one thing becomes female and another male.

For when the starting-point is not doing the mastering, is not capable of concoction because of deficiency of heat, and does not lead toward its own special form, but is defeated in this respect, it is necessary for it to change to its contrary. But what is contrary to the male is the female, and contrary in that respect whereby the one is male and the other female. And since it differs in the capacity it possesses, so too the instrument it possesses differs, so that it changes to its contrary. And as one vital part changes, the whole composition of the animal differs greatly in form. This may be

255. 728ᵃ25–30.

seen in the case of eunuchs, who, though deformed in [only] one part, utterly change their old shape and fall short [only] a little from the visible form of a female. The cause of this is that some of the parts are starting-points, and when a starting-point is moved [or changed], it is necessary for many of the parts that follow along with it to change in step.

If, then, the male is a certain starting-point and cause, and it is male insofar as it is capable of something, female insofar as it is incapable, and the defining mark of the capacity, and of the incapacity, is being capable of concocting, or being incapable of concocting, the last stage of the nourishment (which in the blooded animals is called "blood" and in the others its analog), and the cause of this resides in the starting-point, that is, in the part of the body that contains the starting-point of the natural heat, it is necessary in the blooded animals for a heart to be composed, and for what comes to be to be either male or female, and in the other kinds that have the female and the male, an analog of the heart. This, then, is the starting-point and the cause of male and female and in this it resides. But the animal is by this time female or male when it also has the parts by which the female differs from the male; for it is not by virtue of any part whatever that it is male or female, any more than in the case of seeing or hearing.

To recapitulate, we say that the seed has been established to be a residue of the nourishment, the last stage of it. And by "last stage" I mean what is carried to each [part], which is also why what comes to be is like its progenitor; for it makes no difference whether it comes from each of the parts or that it goes to each of them—but the latter is more correct. But the seed of the male differs [from that of the female] because it contains a starting-point within itself of such a sort as to cause movement in the animal too[256] and to concoct the last stage of the nourishment, while that of the female contains matter alone. When it has mastered [the latter], it draws [it] to itself, but when it has been mastered, it changes to its contrary or to being destroyed. And contrary to the male is the female, and it is female due to the unconcoctedness and coldness of its sanguineous nourishment. And nature assigns each of the residues to the part receptive of it. But the seed is a residue, and this in the hotter of the blooded animals—that is, the males—is moderate in quantity. That is why the parts receptive of this residue in the males are ducts. In the females, on the other hand, because of unconcoctedness, there is a [large] quantity of sanguineous material (for it is incapable of being worked up). So it is also necessary for there to be some part receptive of it, and for this to be unlike [that in the male] and to have magnitude. That is why the nature of the uterus is of this sort. And it is by this part that the female differs from the male.

Due to what cause, then, one thing is female and another male has been stated.

256. Reading καὶ ἐν τῷ ζῴῳ. The animal referred to is, as often, the embryo.

4.2
Evidence for the Proposed Theory of Sex Differentiation in the Embryo

And the facts are proofs of what was said. For the young are more productive of females than those that are in their prime, as too are those that are older; for in the former the heat[257] is not yet complete, while in the latter it is failing.

Also, bodies that are more liquid and more womanly are more generative of females, and liquid seeds more than those that have been more composed. For all of these come to be because of a want of natural heat, and there is more production of males when the winds are north than south; for bodies are more liquid during south winds, so that they are more productive of residue. And the more residue there is the more difficult it is to concoct. That is why the seed in males, and the menstrual excretion in females, is more liquid [then].

Also, due to the same cause, when the menses occur in accord with nature they occur more when the moon is waning. For this time of the month is colder and more humid due to the waning and failing of the moon; for while the sun in the whole year produces winter and summer, the moon does so in the month (this is not because of the solstices, but the one occurs when the light is increased, the other when it is waning).

Shepherds say too that it makes a difference to the production of females and the production of males not only if mating occurs during north winds or south winds, but also if while copulating the animals look south or north. So small a thing, they say, will sometimes shift the balance, becoming a cause of cold or heat, and these of generation.

In general, then, female and male are set apart from each other in relation to production of males and production of females due to the causes stated. Nonetheless, there must also be a proportion in their relation to each other; for all things that come to be either in accord with craft or nature exist in virtue of a certain ratio.[258] But the hot, if it is too mastering, dries up the wet things, while if it is very deficient it does not compose them, instead it must stand in the mean ratio in relation to what is being crafted. If it does not, just as in cooking where too much fire burns the food, while too little does not cook it, and either way the result is that what is coming to be fails to be completed, likewise too in the case of the mixing of what comes from the male and what comes from the female there must be a proportion. And because of this it often happens to many [couples] that they cannot generate with each other, but being separated generate [with other partners], and these contrarieties occur sometimes in young people, sometimes in older ones, alike concerning generation and infertility, and production of males and production of females.

257. I.e., the soul-involving natural heat whose starting-point is in the male semen (766a35–36, b34).

258. 734b19–735a4.

Region differs from region, and water from water, in these respects due to the same causes; for the nourishment and especially the condition of the body become of a certain quality due both to the blend of the surrounding air[259] and of the things that enter in, especially the liquid nourishment; for this is most brought in, and this is in all nourishment, even in dry foods. That is why hard cold waters in some cases produce sterility, in others the production of females.

4.3
Heredity; Monstrosities (1)

And the same causes explain why: some offspring are like their procreators, others not like them; some are like their father, others like their mother, both in the body as a whole and in each part; and are more like them than like their ancestors; and are **$767^{b}1$** more like these than like random people; and males are more like their father, females more like their mother; and some, though like none of their kin, are nonetheless like some human being at least; while others are not like a human being in their visible form but already like a monstrosity. For in fact what is not like its parents is already in a certain way a monstrosity; for nature in these cases has in a certain way deviated from the kind.

And a first starting-point is when a female comes to be and not a male—but this is necessary by nature; for the kind that is separated into female and male must be preserved, and since it is possible for the male sometimes not to master, either due to youth or age, or due to some other cause of this sort, it is necessary for production of females to occur among the animals. The monstrosity, by contrast, is not necessary in relation to the for-the-sake-of-which and the final cause, but is necessary coincidentally, for the starting-point must be grasped from the following: If the spermatic residue in the menses is well concocted, the movement from the male will generate a shape that corresponds to itself; for it makes no difference whether we say the semen or the movement that makes each of the parts grow, or again what makes them grow or what composes them at the start; for the account of the movement is the same [in either case]. So if this movement masters, it will generate a male, not a female, and one that is like the male progenitor and not like the mother. But if it does not master, with regard to each capacity, whatever it is, that has not mastered, it makes [the embryo] correspondingly deficient.

I mean "each capacity" in the following way. What generates is not only [the generic] male but also this sort of male, for example, Coriscus or Socrates, and not only is it Coriscus, but also human. It is in this way, then, that some things are closer and others further away that belong to the male progenitor, insofar as he is generative, and not coincidentally—for example, if the male progenitor is knowledgeable in

259. $777^{b}6–7$.

grammar or someone's neighbor. But what is special and what is particular is always stronger in relation to generation. For Coriscus is both human and animal, but human is closer to what is special [to him] than animal is. Both the particular and the kind generate, but the particular more so; for this is the substance. For though what comes to be comes to be this sort of thing too, it also comes to be a this something—and this is the substance. That is why the movements existing in the seed are from capacities such as all these, and, but potentially, from those of the ancestors as well, but especially those that are closer to a certain particular. By a "particular" I mean Coriscus or Socrates.

Since everything is shifted not into any random thing but into its opposite, what is not mastered in generation is also necessarily shifted and becomes its opposite, with regard to the capacity in which the progenitor and mover has failed to master. If, then, it has not mastered insofar as it is male, it becomes female, if insofar as it is Coriscus or Socrates, it becomes not like its father but like its mother; for as what is opposed, in general, to the father is the mother, what is opposed to a particular male progenitor is a particular female progenitor. And likewise with respect to the capacities that stand next in order; for it always changes more to the next of the ancestors, whether to those of the father or to those of the mother.

Some of the movements are present [in the semen] actively, others potentially: actively those of the male progenitor and the universal (for example, human, animal); potentially, those of the female and the ancestors. On the one hand, then, [movements], when shifted, change to their opposites, and, on the other hand, the movements doing the crafting slacken into those near them—for example, if that of the male progenitor slackens, it changes by a very small difference to that of his father, and in the second instance to that of his grandfather. And in this way too, of course, in the case of females, the movement of the female progenitor slackens into that of her mother, and if not to this, then to that of her grandmother. And likewise in the case of the more remote ancestors.

It is, then, most of all natural for it insofar as it is male and for it insofar as it is father to master and be mastered at the same time; for the difference here is small, so that it takes no work to have both happen at the same time; for Socrates is this sort of man and this man. That is why, for the most part, males are like their father and females like their mother, for the displacement to both has come about at the same time. And female is opposed to male, mother to father, and displacement is into opposites.

But if the movement from the male masters while the one from Socrates does not, or vice versa, then the result is that males come to be that are like mother and females like father.

If the movements slacken, that is, the movement insofar as it is male stands fast, but the movement from Socrates slackens into that of his father, the result will be a male that is like its paternal grandfather or some other of its more remote ancestors, in accord with the same account. But if the movement insofar as it is male is mastered,

the result will be female and most often like its mother, but if this movement too slackens, the similarity will be to the mother's mother or some other of her more remote ancestors, in accord with the same account.

And it is also the same way in the case of the parts; for of the parts too some are like the father, others like the mother, and others like the ancestors; for some of the movements of the parts too are present in them actively, others present potentially, as has often been said.[260] **$768^{b}1$**

But we must take the following as universal hypotheses: one, what was said just now, that some movements are present potentially, others present actively, but also two others, that if it is mastered it is shifted into its opposite, and if it slackens it does so into the movement next in order, and if it slackens less, into what is near, if more, into what is further away. In the end, the movements are so confused that there is no likeness to family members or those of like kind, but only what is common remains, being human. The cause of this is that the latter follows along with all the particulars; for human is universal, while Socrates, father, mother, whoever she may be, are among the particulars.

And the cause of the slackening of the movements is that what affects is also affected by what is affected—for example, what cuts is blunted by what is cut, what heats is cooled by what is heated, and, in general, what moves (except for the primary mover) is moved in return with a certain movement (for example, what is pushed is in a way pushed in return, and what compresses is in a way compressed in return). Sometimes too it is on the whole affected more than it affects, and what heats is cooled and what cools is heated, sometimes not having affected at all, sometimes having affected less than it has been affected. These things have been spoken about in the determinations concerning affecting and being affected, as has in what sorts of beings affecting and being affected belong.[261]

What is affected is shifted and is not mastered, either because of a deficiency of capacity in what is concocting and causing movement or because of the large quantity and coldness of what is being concocted and distinctly formed; for by mastering at one point and not mastering at another it makes what is being composed multiform. For example, in the case of athletes this happens because of eating so much; for because of the quantity of nourishment the nature is not capable of mastering it so as to produce proportional growth and maintain the sameness of shape. The parts thus become qualitatively different, and sometimes in such a way that they are pretty much nothing like they were before. And the disease called "satyriasis"[262] is much the same as this; for in this too, because a large quantity of unconcocted flux or breath[263] is diverted to the parts of the face, the face appears to be that of another animal or of a satyr.

260. E.g., $737^{a}18–30$.
261. *GC* 1.6–7, in particular, $324^{a}24–^{b}13$.
262. Perhaps elephantiasis or a stage thereof.
263. Retaining ἢ πνεύματος.

All of the following have now been determined: due to what cause a female and a
769ᵃ1 male come to be; why some resemble their parents, females female ones, males male ones, and others the reverse, female like the father and males like the mother; and, in general, why some are like their ancestors, others like none of them; and these things
5 both with regard to the whole body and each of its parts.

Certain of the natural scientists, however, speak otherwise about the cause due to which offspring that are like and unlike their parents come about. Indeed, they speak of the cause in two ways. For some say that the one of the two from which
10 more seed comes is the one the offspring is more like, equally for totality in relation to totality and part in relation to part, on the supposition that seed comes from the parts of each. And if an equal amount comes from each of the two, then the offspring, they say, is similar to neither. But if this is false and seed does not come from all [the parts], clearly neither can the cause of similarity and dissimilarity be the one they
15 state. Further, how at the same time a female offspring can be like her father and a male one like his mother is not something they can in a puzzle-free way determine; for while those who speak, as Empedocles and Democritus do, of the cause of female and male say things that are in another way impossible, those who say that it is due
20 to the more or less [seed] coming from male or female, and that it is because of this that one offspring is female and another male, could not demonstrate in what way the female is to be like the father and the male like the mother; for that more should come from both parents at the same time is impossible. Further, due to what cause is an offspring, for the most part, like its ancestors, even the more remote ones? For no
25 seed has come from them, at any rate.

But those who speak in the remaining way about the similarity and the other things speak better, especially about it. For there are certain people who say that the semen, though one, is like a universal seedbed (*panspermia*)[264] consisting of many [seeds]. It is as if someone were to mix together many juices in one liquid and then
30 take some from it, it would be possible to take, not an equal quantity of each always, but sometimes more of this one, sometimes more of that, sometimes some of one and none at all of another—this, they say, results too in the case of the semen's being a mixture of many [seeds]; for the progenitor from whom the most comes in is the one
35 the shape [of the offspring] is like. Though this account is not perspicuous and is in many respects fabricated, it means to be saying something better, that it is not actively
769ᵇ1 but potentially that what it calls a "universal seedbed" exists; for in the first way, it is impossible, but in the second it is possible.

But it is not easy, by assigning a cause in [only] one way, to state the cause of all the cases: of male and female coming to be; why the female is often similar to the
5 father, the male to the mother; and, again, of the similarity to ancestors; further, due to what cause the offspring is sometimes human, though not similar to any of these,

264. This notion stems from Anaxagoras (59B4a DK), but Aristotle applies it to Democritus as well (*Ph.* 203ᵃ21–23).

and sometimes, proceeding in this way, appears not even human but rather a sort of animal only, the ones that are indeed even called "monstrosities."

And in fact, following what was said, the next thing is to speak about the cause of these sorts of monstrosities. For in the end, when the movements [from the male] slacken and the matter [from the female] is not mastered, what is most of all universal stands fast—and this is [the generic] animal. Then people say that what comes to be has the head of a ram or a cow, and in other cases, in like fashion, that of another animal—for example, that a calf has a child's head, or a sheep that of a cow. But though all of these result due to the causes stated, none is what it is said to be, but a likeness only—which is precisely what comes to be even when there is no deformation involved. That is why those who make jibes often liken some people who are not beautiful to a fire-breathing goat, others to a butting ram. And a certain physiognomist[265] has reduced all faces to those of two or three animals, and, in so arguing, often persuaded people.

But that it is impossible for a monstrosity of this sort to come to be (that is, one [kind of] animal inside another) is made clear by the periods of pregnancy, which are much different in the human being, the sheep, the dog, and the cow. And it is impossible for each [kind] to come to be except in its proper time.

This, then, is one way things are said to be monstrosities, others are said to be so for having extra parts to their shape, [for example,] being born with extra feet or extra heads.

The accounts of the cause of what has to do with monstrosities are close to, indeed much the same as, those of what has to do with deformed animals. For monstrosity is a sort of deformation.

4.4
Monstrosities (2)

Democritus said that monstrosities come to be because two lots of semen fall [into the uterus], one being set in movement earlier, the other later, and this latter, once it issues forth [from the male], arrives in the uterus,[266] so that the parts [of the embryo] grow together and become confused. But in the birds, he says, since mating always takes place quickly, both the eggs and their color become confused. But if several offspring come to be from one semen and one act of sexual intercourse, which is precisely what appears to be the case, it is better not to go the long way around, passing the short one by;[267] for especially in such cases it is necessary for this to occur when

265. Identity uncertain.

266. Reading διὰ τὸ δύο γονὰς πίπτειν, τὴν μὲν πρότερον ὁρμήσασαν τὴν δ' ὕστερον, καὶ ταύτην ἐξελθοῦσαν ἐλθεῖν εἰς τὴν ὑστέραν.

267. The thought seems to be that Democritus practices economy of explanation by explaining confusion in egg color in essentially the same way as monstrosities.

the seeds are not disaggregated but instead arrive together [in the uterus]. If, then, we must attribute the cause to the semen from the male, that is the way we would have to state it. But, in general, we must rather think that the cause resides in the matter [contributed by the female] and in the embryos being composed.

That is also why monstrosities of these sorts come to be altogether rarely in one-offspring-bearing animals, but more frequently in the many-offspring-bearing ones, and most of all in the birds, and among the birds most of all in the chickens; for this bird is many-offspring-bearing not only in generating often, like the pigeon kind, but also because it has many embryos at the same time and mates all year round. That is also why it lays many twin eggs; for the embryos grow together because they are near each other, as many fruits sometimes do. From these twin eggs, when the yolks are divided by the membrane, two separate chicks come to be having nothing extraordinary about them, but when the yolks are continuous, with nothing keeping them asunder, from these chicks that are monstrous come to be, having one body and head but four legs and four wings. This is because the upper parts come to be earlier and from the white, the nourishment for them being dispensed from the yolk, while the lower part develops later and its nourishment is one and indivisible.

A snake that is two-headed due to the same cause has also been observed; for this kind too is egg-laying and lays many eggs. Monstrosities, however, are rarer in their case due to the shape of the uterus; for because of its length, the large number of eggs are set in a row. With the bees and the wasps nothing of this sort occurs, because their offspring are in separate cells. But with chickens the contrary is the case, which makes it clear that we must consider the cause of these things to reside in the matter; for among the other animals too monstrosities occur more often in those that are many-offspring-bearing. That is why in the human being they are less common; for it is, for the most part, one-offspring-bearing and a bearer of complete offspring, since, even in the human beings, it is in places where the women bear more than one offspring at a time that monstrosities occur more often—for example, in Egypt. And in goats and sheep they are more common; for they are to a higher degree many-offspring-bearing. And it is still more common in the multi-split-footed animals; for these sorts of animals are many-offspring-bearing and do not bear complete offspring, as the dog does; for in many cases it gives birth to blind offspring.

Due to what cause this happens and due to what cause they are many-offspring-bearing must be stated later.[268] But they are predisposed by nature to bear monstrosities by their not generating offspring that, due to their incompleteness, are not similar [to their parents]. And the monstrosity too is among the offspring that are dissimilar to their parents.[269] That is why this coincident is a point of overlap in animals with this sort of nature. For it is in these too that the ones called "runts" most frequently come to be. And these have in a certain respect been affected in the way

268. 771[a]17–[b]14.
269. 767[b]5–6.

monstrosities have been. For there to be a deficiency or a surplus is a sort of monstrosity. For the monstrosity is among the things that are contrary to nature, not contrary to all nature, but the one that holds for the most part; for concerning the nature that is always and of necessity [the way it is] nothing comes to be contrary to nature, but rather it occurs among the things that, though they are, for the most part, generated in a certain way, admit of doing so in another way. Even in their case, though it occurs contrary to this order, yet, since it always does so non-randomly, [what comes to be] seems less a monstrosity because even what is contrary to nature is in a certain way in accord with nature, whenever the nature that is in accord with the form has not mastered the nature that is in accord with the matter. That is why people do not call things of this [runt] sort "monstrosities" any more than they do in the other cases in which something customarily comes to be, as in the case of fruits. For there is a vine that some people call "smoky," and if it bears black grapes they do not judge it a monstrosity because it is in the habit of doing this very often. The cause of this is that its nature is intermediate between white and black, so that the change is not from far away nor, as it were, contrary to nature; for it is not a change to another nature.

But in many-offspring-bearing animals these things occur because the multiple [embryos] impede each other's completion and generative movements.

One might raise a puzzle about many-offspring-bearing and having an excess of parts, and few-offspring- or one-offspring-bearing and having a deficiency of parts. For sometimes animals come to be having too many toes, while others have only one, and with the other parts it is the same way; for both an animal that has excess parts and one that is docked come to be. Some—both among the human beings and especially among the goats—even have two sex organs, one of a male and one of a female; for goats come to be that are called "hermaphrodites" because of having a female and a male sex organ—and a goat has even been known to have come to be with a horn on its leg.

Changes, deformations, and excesses also come about in the internal parts, by not possessing some of them, by possessing ones that have been docked, too many of them, or misplaced ones. No animal, indeed, has come to be without having a heart, but rather without having a spleen, or having two spleens, or one kidney; and none without having a liver, but without having a whole one—and all these in animals complete and alive. Found too are animals not having a gallbladder that naturally have one; others having more than one. Cases of their being misplaced are also known, the liver being on the left, the spleen on the right. And these have been seen in complete animals, as was just said. In ones being born, on the other hand, one sees much disorder of every sort. Those that depart a little from nature usually live; those that depart a lot, when what is contrary to nature lies in the parts that have control,[270] do not live.

270. $742^{a}32$–$^{b}3$.

The investigation concerning these things is whether we must consider the cause of one-offspring-bearing and having a deficiency of parts, and of having an excess of parts and many-offspring-bearing, to be the same, or not the same.

First, then, why some animals are many-offspring-bearing, while others are one-offspring-bearing, is something it would seem reasonable for someone to wonder at. For it is the largest of the animals that are one-offspring-bearing—for example, the elephant, the camel, the horse, and the solid-hoofed ones. Among these, some are larger than [all] the other animals, while others are very outstanding in size. The dog and the wolf, on the other hand, and pretty much all the multi-split-footed animals are many-offspring-bearing, even the small ones of these sorts—for example, the mouse kind. The cloven-hoofed animals are few-offspring-bearing, except for the pig, which is among the many-offspring-bearing ones. For it is reasonable that the larger ones be capable of generating more offspring and bear more seed. But the very thing that we wonder at is a cause not to wonder; for it is because of their size that they do not give birth to many offspring; for the nourishment in these sorts of animals is used up for the growth of the body, while in the smaller animals nature subtracts from the size and adds the excess to the spermatic residue. Further, it is necessary for the generating seed of a larger animal to be greater in quantity, and for that of smaller ones to be small in quantity. And though many small ones can come to be in the same [place], it is difficult for many large ones. And to those intermediate in size nature has assigned the intermediate [number].

Of there being some animals that are large, others smaller, others intermediate, we have previously stated the cause.[271] Some of the animals are one-offspring-bearing, others few-offspring-bearing, others many-offspring-bearing. For the most part, the solid-hoofed ones are one-offspring-bearing, the cloven-hoofed few-offspring-bearing, and the multi-split-footed many-offspring-bearing. The cause of this is that, for the most part, their sizes correspond to this difference. But it is not so in all cases; for it is the largeness and smallness of their bodies that is the cause of their being few-offspring-bearing and many-offspring-bearing, but not the kind's being solid-hoofed, cloven-hoofed, or multi-split-footed. Here is evidence of this: the elephant is the largest of animals, though it is multi-split-footed, and the camel, which is cloven-hoofed, is the largest of the remaining ones. And it is not only among the animals that walk but also among the ones that fly and swim that the large ones are few-offspring-bearing and the small ones many-offspring-bearing, due to the same cause. Similarly, it is not the largest plants that bear the most fruit.

Why the nature of some animals is many-offspring-bearing, others few-offspring-bearing, others one-offspring-bearing has been stated. As for the puzzle that has just now been stated, one might reasonably wonder at those that are many-offspring-bearing, since these sorts of animals are often seen to conceive after a single mating. But whether the seed of the male contributes to the matter of the embryo

271. Perhaps a reference to *PA* 686[b]29–32.

by becoming part of it and mixing with the seed of the female, or whether in fact it is not that way but, as we say, by bringing together and crafting the matter in the female, that is, the spermatic residue, just as the fig juice does the liquid in milk—due to what possible cause does it not complete [just] one animal having [the relevant] size, just as there, in the example, the fig juice is not separated in composing a certain quantity, but rather the more it is put into and the more it is, so much the greater is what is curdled?

To say that the places in the uterus draw the seed and because of this several offspring come to be, that is, because of the number of the places and because of the cotyledons not being one, is to say nothing; for often two [embryos] come to be in the same place in the uterus, and in the many-offspring-bearing animals, when the uterus is filled with embryos, they are seen to lie in a row. This is clear from dissections. But in fact, just as when animals are completing [their growth] there is a certain size for each, both in the direction of larger and in the direction of smaller, neither will any come to be that is larger or smaller than this, but rather it is within the intervening interval that there is an excess or deficiency in the size they get in relation to each other, and one becomes a bigger and another a smaller human being, or any other animal whatever—so too the spermatic matter from which [the embryo] comes to be is not so unlimited, either in the direction of more or in the direction of less, that it comes from some random quantity. Due to the cause stated, then, in the case of all the animals that emit more residue than is the starting-point for one animal, it is not possible that from all of it [only] one comes to be, but rather as many as is determined by the sizes that pertain; nor will the seed of the male or the capacity in the seed compose anything more or less than what is natural. Similarly, if the male emits more seed, or there are more capacities in the divided-up seed, the greatest possible amount of it will not produce anything bigger [than what is natural], but on the contrary will destroy [the spermatic matter in the female] by drying it up. For even fire does not heat up water more as it is itself increased; rather, there is a defining mark of the hotness, which once reached, if one increases the size of the fire, the water no longer becomes hotter, but instead evaporates more and more, and in the end disappears and dries up.

Since, then, it appears that the residue of the female and that from the male need (in all those where the males emit seed) to stand in some proportional relationship to each other, in the case of those animals that are many-offspring-bearing, the males at the outset emit [seed] capable, when divided into parts, of composing several embryos, while the female emits enough that several can come to be composed. (In the case of the milk example we stated it is not like that; for in the case of the heat of the seed what is composed is not only a certain quantity but also has a certain quality, while in the case of fig juice or rennet the quantity alone is involved.) Of many embryos coming to be, then, and not one continuous one, this is the cause in the many-offspring-bearing animals, that the embryo does not come to be from some random quantity, on the contrary, if there is too little or too much, there will not be

one; for there is a determinate limit to the capacity, what is affected, and the heat of what affects it.

Similarly, in the case of the large one-offspring-bearing animals it is not the case that many offspring come to be from much residue; for in them too it is from a certain quantity that a certain quantity gets worked up. They do not, then, emit a larger quantity of this sort of matter due to the cause stated. And what they do emit is just enough, in accord with nature, for one embryo to come to be from it. But if at some time more of it comes, then two come to be. That is also why such things seem to be more monstrous, because they occur contrary to what holds for the most part and what is usual.

The human being, however, plays a double game in all the modes of generation; for it is one-offspring-bearing, few-offspring-bearing, and many-offspring-bearing at times, but its nature is most of all one-offspring-bearing—because of the wetness and hotness of its body it is many-offspring-bearing (for the nature of seed is wet and hot), but because of its size it is few-offspring-bearing and one-offspring-bearing. And because of this it also happens that it is the only animal whose periods of pregnancy are irregular. For while in the others there is a single period, in the human beings there are several; for they are born at seven months, at ten months, and at the intermediate times; for even those of eight months do live, but less often.[272] The cause may be made out on the basis of what has just been said; it has been spoken about in the *Problems*.[273]

And about these issues, let things be determined in this way.

Of the excess of parts contrary to nature and the birth of twins the cause is the same. For already in the embryos the cause occurs, whenever it composes more matter than corresponds to the nature of the part; for then the result is that one part is larger than the others—a finger, hand, foot, or some other of the extremities or limbs—or else, if the embryo is divided, more parts come to be, as eddies do in rivers; for in these eddies too as the water is carried along and, having movement, collides with something, from the one [eddy] two compositions come to be that have the same movement. It happens in the same way in the case of the embryos as well. The [parts] are mostly attached near each other, although sometimes they are further away because of the movement occurring in the embryos, and especially because of the excess of matter being assigned to the place it was subtracted from, while retaining the form of that [part] from which it was [subtracted as] excess.

In some cases these sorts of things occur in such a way that the embryos have two sex organs, one male, the other female, but when such excess occurs, one part has control and the other lacks control, and is always made weak as regards nourishment, since it is contrary to nature, and is attached just as tumors are; for these too get nourishment, although they occur after birth, and are contrary to nature. If what is

272. *HA* 584[a]33–[b]12.

273. No such discussion is found in the extant †*Pr*.

doing the crafting has gained mastery, or is wholly mastered, two similar [sex organs] come to be. But should it in part master and in part be mastered, one is female, the other male; for it makes no difference whether we state the cause due to which one is female and another male in the case of the part or in the case of the whole.

And wherever a deficiency occurs in these sorts of parts, for example, in an extremity or certain of the other limbs, we must consider the cause to be the very same as when the whole embryo miscarries (and miscarriages of embryos occur frequently). **773^{a}1**

Outgrowths differ from many-offspring-bearing in the way stated, while monstrosities differ from these in that most of them are due to [embryos] growing together. In some cases, they also differ in this way if the [monstrosity occurs] in the larger and more controlling parts—for example, some have two spleens, or several kidneys. Further, the parts may change locations because of the movements being diverted and the matter changing places. We should consider the monstrosity to be one animal, or several growing together, by reference to the starting-point. For example, if the heart is a part of this sort, what has one heart is one animal, and the excess parts [mere] outgrowths, while those that have several hearts will be[, for example,] two animals, though grown together due to the junction of the embryos.

It often happens, even with many animals that do not seem to be deformed and are already completely developed, that some of their ducts have grown together, while others have been diverted. And, in fact, in some women the mouth of the uterus has been known to remain closed until the time for the menses and the subsequent pains. In some cases, they broke through spontaneously, in others due to doctors having cut the mouth open. And some cases have resulted in death if the breakthrough occurred by force or could not occur. And in some boys it happens that the end limit of the sex organ and the duct through which the residue from the bladder passes do not coincide, but the latter is underneath, which is also why they sit when they urinate, and since the testicles have been drawn up they seem from a distance to have a female and a male sex organ at the same time. And the duct for dry nourishment has also been known to grow closed in certain animals, both sheep and others, since in fact in Perinthus a cow came to be that passes fine-grained filtered nourishment through the bladder, and when its anus was cut open it quickly grew closed again, and they could not keep it open.

Being few-offspring-bearing and many-offspring-bearing, as well as outgrowths of excess parts, and further, monstrosities, have now been spoken about.

4.5
Superfetation

In some animals, superfetation does not occur at all, in others superfetation does occur, and among the superfetators, some are capable of bringing the embryos to birth, others are capable of doing so sometimes, sometimes not. The cause of not

being a superfetator is their being one-offspring-bearing. For the solid-hoofed animals and those larger than these do not superfetate; for because of their size the residue gets used up for the [one] embryo. For all these have large bodies, and of large animals the fetuses are large in proportion. That is why too the fetus of elephants is as big as a calf. The many-offspring-bearing animals do superfetate, because where there is more than one [fetus], one is a superfetation of the other.

Among these, the ones that are large, such as the human being, if the one mating occurs soon after the other, it brings the second embryo to birth; for cases of this sort have been observed to occur. The cause is that just stated; for even in a single act of sexual intercourse the seed emitted is more than enough, and when it is divided up it produces many offspring, one later than the other. But when the embryo has already [somewhat] grown and it so happens that mating occurs [again], superfetation sometimes takes place, although rarely, because the uterus generally closes up in women while they are pregnant. But if ever this does happen (and in fact it has been known to occur in the past), completion [of the second embryo] is impossible; instead, [such] embryos fall out in much the same condition as what are called "premature" births. For just as in the case of the one-offspring-bearing animals, because of their magnitude, all the residues go to the preexisting [embryo], so it is here too, except that there it is so from the outset, while here it is when the embryo has [somewhat] grown; for at that time they are in much the same condition as one-offspring-bearing animals. Similarly, because the human being is by nature many-offspring-bearing, and because there is something to spare both in the size of the uterus and the quantity of the residue (though not enough to bring a second embryo to birth), the only animals that admit of mating while pregnant are woman and mare, the first due to the cause just stated, the mare both because of the barrenness of its nature and because there is something to spare in the size of its uterus, which, though it has room for more than one, is too small to superfetate another complete one.

And the mare is by nature lecherous because it is affected in the same way as barren females; for the latter are of this sort because a [menstrual] purgation does not occur (which corresponds to ejaculation in males), and mares emit very little purgation. And in all the live-bearing animals the barren females are given to sexual activity because their condition is much the same as that of males when the seed has collected [in the testicles] but has not been secreted. For in females the purgation of the menses is an emission of seed; for the menses is seed that is unconcocted, as was said previously.[274] That is also why those women who lack self-control in relation to sexual intercourse of this sort, when they have borne many children, cease from their passionate excitement; for when the spermatic residue has been excreted, it no longer produces an appetite for sexual intercourse. Among the birds, the females are less lecherous than the males because they have the uterus up near the diaphragm, while with the males things are the contrary way; for their testicles are drawn up within

274. 726ᵇ30–727ª4.

them, so that if any such animal kind by nature produces a lot of seed, it is always in need of sexual intercourse. In the females, then, it is the coming down of the uterus, and in the males the drawing up of the testicles, that is favorable to mating.

Due to what cause, then, some animals do not superfetate at all, while others do superfetate but sometimes bring the embryos to birth and sometimes do not, and due to what cause some are lecherous, others not lecherous, has now been stated.

Some of the animals that superfetate are capable of bringing the embryos to birth even when much time elapses between the matings, those whose kind produces a lot of seed, do not have a large body, and are among the many-offspring-bearing animals; for because of their being many-offspring-bearing their uterus is roomy, because of producing a lot of seed they emit much residue for purgation, and because their body is not large, but the purgation exceeds by a large ratio the nourishment that goes to the embryo, they are capable both of composing the animals to a later point and of bringing them to birth. Further, the uterus in animals of this sort does not close up [during pregnancy] because of the spare residue for purgation. This has been known to happen even in the case of women; for in some of them the purgation occurs even through to the end of pregnancy. But in these it is contrary to nature (which is why it harms the embryo), while in these other animals it is in accord with nature; for their body is composed in this way from the start—for example, that of the hares; for this animal superfetates; for it is not one of the large animals, is many-offspring-bearing (for it is multi-split-footed, and the multi-split-footed ones are many-offspring-bearing), and produces a lot of seed. Their hairiness makes this clear; for the quantity of their hair is excessive; for it alone of the animals has hair under its feet and inside the jaws. And hairiness is a sign of a large quantity of residue, which is why, among the human beings too, the hairy ones are lecherous and produce more seed than smooth ones. As for the hare, it often has some embryos that are incomplete, but delivers others of its young complete. **$774^{b}1$**

4.6
Degrees of Completeness in Neonates

Among the live-bearing ones, some deliver animals that are incomplete, others animals that are complete; the solid-hoofed and the cloven-hoofed animals deliver complete ones, most of the multi-split-footed animals incomplete ones. The cause of this is that, for the most part, the solid-hoofed ones are one-offspring-bearing, the cloven-hoofed one-offspring-bearing or two-offspring-bearing, and it is easy to bring the few to birth. But of the multi-split-footed animals that give birth to incomplete offspring all are many-offspring-bearing. That is why, though they are capable of nourishing the embryos when they are young, once these embryos have grown somewhat and have attained some size, their bodies are incapable of nourishing them, and deliver them just as the larvae-generating animals do. And, in fact, some of them are

pretty much non-articulated when generated, as are the fox, the bear, the lion, and, in much the same way, some of the others. And pretty much all of them are blind—for example, not only the former ones but also, further, the dog, the wolf, and the *thôs*.[275] The pig alone is many-offspring-bearing and gives birth to complete offspring, and it alone overlaps [genera]; for it is many-offspring-bearing like the multi-split-footed animals, but is solid-hoofed and cloven-hoofed; for solid-hoofed pigs exist in certain places.[276] They are many-offspring-bearing, then, because the nourishment that goes to size [is diverted] to the secretion of spermatic residue (for considered as a solid-hoofed animal, the pig is not large in size), and at the same time—as if disputing the nature of the solid-hoofed ones—it is more often cloven-hoofed. Because of this, then, it is sometimes one-offspring-bearing, sometimes two-offspring-bearing, but most often many-offspring-bearing, and brings these to birth because of the good condition of its body; for it has sufficient and plentiful nourishment as rich soil does for plants.

Some of the birds too give birth to incomplete and blind young, the ones that are many-offspring-bearing, though not having large bodies themselves (for example, the crow, the jay, the sparrows, and the swallows) and those of the few-offspring-bearing ones that do not give birth to plentiful nourishment in the egg along with the young (for example, the wild pigeon, the turtledove, and the common pigeon). And because of this, if one puts out the eyes of swallows while they are still young, they heal again; for the birds are still developing when they are injured, not yet developed, which is why they grow and sprout from the start. And, in general, [a bird] is born prior to being complete, because of the inability [of the progenitors] to nourish it, and it is generated incomplete because of that priority. This is clear too in the case of seven-month children; for in some of them, because they are not complete, even the ducts—for example, of the ears and nostrils—are often not yet articulated, but become articulated as the children grow. And many such children live on.

In the human beings more males are born deformed than females, but in the other animals, not at all so. The cause is that in the human beings the male is much different from the female in the hotness of its nature, which is why male embryos move about more than female ones, and because of their movement they get more damaged; for what is young is prone to destruction because of its weakness. And it is due to this same cause too that, in women, female ones are not completed in a similar way to male ones, while in other animals they are completed in a similar way;[277] for in them the female in no way much lags behind the male, as in the case of women; for while within the matrix, the female takes more time to become disaggregated than the male does, once having emerged, everything gets completed earlier in females than in males—for example, puberty, prime of life, and old age; for females are weaker and

275. *HA* 507b17.
276. *HA* 499b11–13.
277. Lines a–c are added from the Latin and Arabic translations.

colder in nature, and we must suppose femaleness to be like a natural deformation. While it is within the mother, then, it gets disaggregated slowly because of its coldness (for disaggregation is concoction, it is heat that concocts, and what is hotter is easily concocted), but outside, because of its weakness, it quickly reaches its prime and old age; for all inferior things reach the end more quickly, and just as they do in works that are in accord with craft, so they do too in those composed due to nature. And due to the cause stated twins in the human beings are also less likely to survive if they are male and female, in other animals not at all so; for in the human beings it is contrary to nature for these to run an equal course, as their disaggregation does not occur in equal times; rather, it is necessary that the male be late or the female early. In the other animals, however, it is not contrary to nature.

A difference also exists between the human beings and other animals as regards their pregnancies; for the other [animals] are in a more thriving bodily condition most of the time, while most women feel discomfort during pregnancy. A cause of these things is also due to their mode of life; for because they are sedentary, they are filled with a greater quantity of residue, since in those nations in which the life of women involves hard work, pregnancy is not equally noticeable, and they give birth easily there, and wherever they are accustomed to hard work; for hard work uses up the residues, while in sedentary women a large quantity of such residues is present due to the absence of hard work and because no purgations occur during pregnancy—and so labor is painful. But hard work exercises their breath so that they are capable of holding it, and it is in this that the ease or difficulty of giving birth lies. **$775^{b}1$**

These things, then, as was just said, contribute to the difference in how other animals and women are affected, but the most important cause is that in some animals little purgation occurs, and in others it is not noticeable at all, while in women much more occurs than in [other] animals, so that when, due to pregnancy, its excretion does not occur it produces disturbance; for even if they are not pregnant, when the purgations do not occur, diseases result. And most women are more troubled when they first conceive; for while the embryo is capable of preventing the purgations, because of its smallness it does not use up the residue in any large quantity at first, but later on, when it takes its share, it eases the trouble. (In the other animals, however, because there is little [residue], it is proportional to the growth of their embryos, and as the residues that hinder growth get used up, their bodies are in better condition. And in the aquatic animals and the birds it is the same way.) But if by the time the embryos become big the mother's body is no longer in thriving condition, the cause is that the growth of the fetus needs more nourishment than is provided by the residue. In some few women, however, their bodily condition is better during pregnancy—these are the ones in whose bodies the amount of residues is small, so that they get used up along with the nourishment that goes to the embryo.

4.7
Molar Pregnancies

We must also speak about what is called a "mole," which occurs rarely in women, but this affection does occur in some pregnant ones. For they give birth to what they call a "mole." For it has been known to happen to a certain woman who had had sexual intercourse with a man, and supposed that she had conceived, that at first the bulk of her abdomen grew, and all the other things occurred in accord with reason, yet when it was the time for giving birth, she neither gave birth to a child nor did her bulk become smaller, but instead she continued in this condition for three or four years until dysentery came on, endangering her life, and she gave birth to the fleshy mass they call a "mole." In some cases too, this affection continues into old age and lasts until death. The masses that emerge in cases of this sort become so hard that they can scarcely be cut in two even with iron. (The cause of this affection has been spoken about in the *Problems*;[278] for the embryo is affected in precisely the same way in the **776ᵃ1** uterus as parboiled things are in cases of boiling, and not because of the hotness, as some people say, but rather because of the weakness of hotness; for the nature seems to be weak and not capable of completing or putting a limit to the process of generation. That is why too the mole remains in them into old age or for a long time; for it has neither the nature of something completed nor of an altogether foreign body.) Of its hardness, in fact, non-concoction is the cause; for parboiling too is a sort of non-concoction.

The puzzle it involves is that of why exactly this does not occur in other animals, unless it does but has altogether escaped notice. We must consider the cause to be that woman alone among the animals is subject to troubles of the uterus, that is, as regards the purgations, she is excessively productive, and is incapable of concocting these. When, then, the embryo is composed of a wet secretion that is difficult to concoct, what is called a "mole" occurs in these women—reasonably most of all in these or in these alone.

4.8
Milk

Milk occurs in all females that are internally live-bearing as something useful at the time of giving birth; for nature has made it in animals for the sake of nourishment, the one they get externally, so that it is neither at all deficient nor at all excessive in this time period. And this is precisely what we see happening unless something contrary to nature occurs. In the other animals, because there is a single period of pregnancy, the time for the concoction of milk is in all cases related to it. But in the

278. No such discussion is found in the extant †*Pr.*

human beings, since there are several periods, it is necessary for it to be present at the first one; that is why milk is useless before the seventh month in women, and then at that point becomes useful. But it also reasonably happens, due to an of-necessity cause, that it is concocted [only] in the final stages; for at first the secretion of this sort of residue is used up for the generation of the fetuses. Of all [secretions] nourishment is the sweetest and most concocted, so that when a capacity of this sort is subtracted it is necessary for what remains to be salty and ill-flavored. But when embryos are becoming complete, the surplus residue is greater (for less of it gets used up) and sweeter, since the well-concocted part is not being subtracted to the same extent. For it is no longer going toward the molding of the fetus but toward its small growth, as if the fetus were halting due to [attaining] its end. For there is a sort of completion even of an embryo. That is why it emerges and changes its process of generation, as now having the things that are its own, and no longer getting the things that are not its own, which is the time in which milk becomes useful.

It is in the upper part and the breasts that milk collects because of the order of composition from the starting-point. For what is above the diaphragm is the controlling part of the animal, while the one below is for the nourishment and the residue, in order that those animals that move by walking have within them a self-sufficiency of nourishment for changing from place to place. From the former too the spermatic residue is secreted, due to the cause stated in the starting accounts.[279] But both the residue of the male and the menses of the female are of a sanguineous nature, and the starting-point of this and of the blood vessels is the heart. And it is situated in these parts. That is why it is first there that it is necessary for the change in these residues to become noticeable. It is why indeed the voices both of males and of females change when they start to bear seed (for the starting-point of the voice is there, and itself becomes altered when what moves it becomes altered[280]). And the parts around the breasts become raised up in an obvious way even in males, but more so in females; for because the excretion downward becomes great the place of the breasts becomes empty and spongy in them—and likewise in the other animals that have their breasts down below.

The change both in the voice and in the parts around the breasts even in the other animals becomes noticeable to those who have experience with each kind, but the difference is greatest in the case of the human beings. The cause is that the production of residue in proportion to size among females is greatest in these females, and among males in these males—in the former the menses, in the latter emission of seed.[281] When, then, the fetus does not take up this sort of secretion, yet prevents it from getting outside, it is necessary for all the residue to collect in those empty places that are situated on the same ducts. And in each [kind of animal] the place

279. $738^{b}15–18$, $747^{a}19–20$.

280. $787^{b}19–788^{a}16$.

281. Reading ταῖς μὲν τὴν τῶν καταμηνίων, τοῖς δὲ τὴν τοῦ σπέρματος πρόεσιν.

of the breasts is of this sort due to both causes, becoming of this sort both for the sake of the better and of necessity. It is there, then, that the concocted nourishment for [newborn] animals is at this time composed. And because of its concoction, it is possible to take either the cause stated,[282] or even the contrary; for it is also reasonable for the fetus, since it is larger, to take up more nourishment, so that the surplus is less around this time—and less is concocted more quickly.

That milk has the same nature as the secretion from which each animal comes to be is clear, and was also stated previously.[283] For the same matter both nourishes and is what the nature composes [the animal] from in the process of generation. This is the sanguineous liquid in the blooded animals. For milk is blood that is concocted but not destroyed. As for Empedocles, either he has interpreted things incorrectly or employed a bad metaphor when he wrote in his poem that milk is "a white pus that comes into existence on the tenth day of the eighth month."[284] For putrefaction and concoction are contrary, and pus is a certain sort of putrefaction, while milk is among the concocted things.

When women are suckling children, the purgations, when in accord with nature, do not occur, nor do women conceive when they are suckling. And if they do conceive, the milk dries up because the nature of the milk is the same as that of the menses. And nature is not capable of being so productive as to play a double game; rather, if the secretion occurs in one direction it is necessary for it to fail in the other, unless something comes about that is forced and contrary to what holds for the most part.

The process of generation of animals has also been well distinguished into periods of time; for when the nourishment coming through the umbilical cord is no longer sufficient for the embryo, because of its size, at the same time the milk becomes useful for what becomes its nourishment. And when the nourishment does not enter through the umbilical cord, these blood vessels collapse, which what is called the "umbilical cord" surrounds like a membrane. And because of these things and at this time the [offspring's] exit to the outside results.

4.9
Why Animals Are Born Head First

Head first is the process of generation that is in accord with nature for all animals, because the parts above the umbilical cord are larger than those below. Being attached to it, then, as to the beam of a balance, they incline toward the weightier side. And the larger parts have more weight.

282. 776ᵃ25.
283. 739ᵇ25–26.
284. B68 DK.

4.10
Periods of Pregnancy

The periods of pregnancy for each of the animals are, for the most part, determined in accord with their lives; for it is reasonable for the processes of generation for the longer-lived ones to be longer. Nonetheless, this is not the cause, although it is what for the most part happens; for though the larger and more complete of the blooded animals do also live a long time, nonetheless the larger ones are not all longer-lived. **777^{b}1** In fact, the human being is the longest-lived of them all except the elephant, so far as we have any reliable experience. And yet the human kind is smaller than that of those with long hair in their tails, and many others. The cause of long life in any sort of animal is its being blended in much the same way as the surrounding air, and because of certain other coincidents of its nature that we will speak about later on.[285] But for the periods of pregnancy the cause is the size of the things being generated; for it is not easy for large compositions to reach their completion in a short time, whether they are animals or (one might almost say) anything else whatever. That is why the horses and animals of the same kind as these, although living a shorter time [than the human beings] are pregnant a longer time; for in the former the birth is in a year, but in the latter in ten months at the most. And due to the same cause, in the case of the elephants the birth is in a long period of time; for their pregnancy lasts two years because of their excessive size.

It is reasonable that in all animals the duration of pregnancy, of the process of generation, and of lifespan tend in accord with nature to be measured out by periods. By a "period" I mean a day, a night, a month, a year, and the greater periods of time measured by these; further, the periods of the moon. The periods of the moon are full moon, [completely] waning moon, and the dichotomies of the intermediate times; for it is in accord with these that it is in connection with the sun; for the month is a period common to both. And the moon for its part is a starting-point because of its connection with the sun and its participation in the sun's light; for it becomes like another sun, a lesser one.

That is why it contributes to all processes of coming to be and processes of completing. For hotness and coldness, up to a certain proportion, produce the processes of coming to be, and afterward those of passing away. And it is the movements of these stars that fix the limit, both the starting-point and the end-point, of these processes. For just as we see the sea, and all of what is of the nature of liquids, to be settling or changing in accord with the movement or rest of the winds, and the air and the winds in accord with the period of the sun and the moon, so too the things that grow from these or are in these necessarily follow along; for it is in accord with reason for the periods of things that are more lacking in control to follow along with **778^{a}1** those of the things that have more control. For a wind too has a sort of life and a

285. *Long*. $466^{a}17$–$467^{a}5$.

coming to be and passing away.[286] And of the revolutions of these stars there may perhaps be other starting-points.

Nature, then, tends to measure comings to be and endings by the number of these revolutions, but cannot bring this about in an exact way because of the indefiniteness of matter, and because many starting-points exist that impede their comings to be and passings away from being in accord with nature, and often cause things to happen contrary to nature.

The internal [to the mother] nourishment of animals and the external have now been spoken about, both about each separately and about all in common.

BOOK 5

5.1
Affections of Animals and Their Parts; Sleep; Color of Eyes; Sharpness of Sight

We must now get a theoretical grasp on the affections by which the parts of animals differ. I mean the following sorts of affections of the parts: blueness and blackness of eyes, height and depth of voice, and differences of color, whether of the body[287] and the hair or of the feathers. Among these sorts of affections, some are found existing throughout a whole kind, others in a random manner—for example, this happens most of all in the case of the human beings. Further, in connection with the changes of age, some belong alike to all animals, while others do so in contrary ways, as in what has to do with the voice and the color of hair; for some do not go noticeably gray toward old age, while the human being is more affected by this than any of the other animals. Also, some of these affections follow along immediately after birth, while others become clear as age advances, or in old age.

As regards these affections and all the others of these sorts, however, we must no longer consider the mode of cause to be the same [as previously]. For none of the things that are not works of nature, whether common or special to a given kind, either exists or comes to be for the sake of something. For though the eye is for the sake of something, it is not blue for the sake of anything, unless this affection is special to the kind. Nor, in some cases, does the affection lead to the account of the substance, but rather, as coming of necessity, one must refer to the matter and the
778[b]1 moving starting-point as the causes. For just as was said at the start in the first accounts,[288] it is not because each thing comes to be of a certain sort that it is of a certain sort, when the things are ordered and determined works of nature, but rather

286. *GC* 318[b]29–33, *Mete*. 360[a]17–[b]26.
287. Reading ἢ σώματος.
288. *PA* 1, especially 640[a]3–[b]4.

it is because they are of this sort that they come to be of this sort; for the coming to be follows along with the substance and is for the sake of the substance, and not it for the sake of the coming to be. (The ancient natural scientists, however, thought the contrary to be so. The cause of this is that they did not see that the causes were many, but saw only that of the matter and that of the movement—and these indistinctly. But to that of the account and that of the end they gave no consideration.[289])

Although each of the relevant things, then, is for the sake of something, it is generated at this point due to this cause and due to the remaining ones, which are present in the account of each thing, either as being for-the-sake-of-something or as being for-the-sake-of-which. On the other hand, for things not of this sort, but of which there is a process of generation, at this point the cause must be sought in the movement and in the process of generation, on the supposition that it is in the process of composition itself that they acquire what is different about them. For though an animal will of necessity have an eye (for it is hypothesized as being an animal of this sort), and of necessity an eye of this sort, the necessity is not of the same sort, but is a different mode [of necessity], that the animal is naturally such as to affect in this sort of way or to be affected in this sort of way.

Having drawn these distinctions let us speak about the things that come next in order. First, then, in the case of all animals, when the young are born, especially those that are born incomplete, they are in the habit of sleeping, because inside the mother too, when they first acquire perception, they are continually asleep. —But there is a puzzle about the start of the process of generation as to whether wakefulness belongs to animals first or sleep does. For because it is evident that as they grow older they become more awake, it is reasonable that the contrary belongs to them at the start of the process of generation: sleep. Further, because the change from not being to being takes place through the intermediate, and sleep seems to be in nature among the things of this sort, being, as it were, a boundary between living and not living: a sleeper neither fully is not nor fully is. For living most of all belongs to being awake, because of perception. On the other side, if it is necessary for an animal to have perception, and if the time it is first an animal is when perception first takes place, then we must consider its condition at the start to be not sleep but something resembling sleep, a condition of the very sort that the plant kind is also in; for at this time animals too are living the life of a plant. But for sleep to belong to plants is impossible; **779^{a}1** for there is no sleep from which it is impossible to awake, and from the affection of plants that is the analog of sleep it is impossible to awake. —It is necessary in any case for these animals to sleep most of the time because the growth and the heaviness lie in the upper places (we have said elsewhere[290] that the cause of sleep is of this sort). Nonetheless, it is evident that they wake up even in the uterus (this is clear in dissections and in the egg-laying animals), and then immediately fall asleep and are

289. *Met*. $988^{a}18$–$^{b}16$, $993^{a}11$–17.
290. *Somn*. $456^{b}17$–28.

weighed down again. That is why when they have emerged [from the mother] too, they spend most of their time asleep.

Also, when they are awake, infants do not laugh, but while asleep they both cry and laugh. For perceptions occur in animals even when they sleep, not only in what are called "dreams," but also outside dreams, as in the case of those who get up and do many things without dreaming. For there are some people who get up while sleeping and walk about, seeing just like those who are awake. For perception of what is happening occurs in these, though they are not awake, yet not as a dream does. But infants, it seems, as if not knowing how to be awake, because of being accustomed to it, perceive and live in their sleep. But as time goes on and the growth changes over to the lower part, they at this point wake up more and spend most of their time this way. At first, they are more continually asleep than the other animals; for they are born more incomplete than any other complete-at-birth animal and having growth most of all in the upper part of the body.

The eyes of all children are bluish immediately after birth, but later on they change to what is going to be the natural one for them. But in the case of the other animals this does not noticeably occur. The cause of this is that the eyes of other animals are more of one color—for example, cows are dark-eyed, the eye of all sheep is pale gray, of others again the whole kind is bluish-gray or blue, and some are greenish,[291] like the majority of the goat kind itself. The eyes of the human beings, on the other hand, are of many colors; for they are blue, bluish-gray, or dark in some cases, and others are greenish. So, in the case of the other animals, just as the individuals do not differ from each other in this way, they do not differ from themselves [at different times] either; for they are not of a nature to have eyes of more than one color. But, of the other animals, it is most of all the horse that has eyes of many colors; for some of them in fact have eyes of different colors.[292] None of the other animals is noticeably affected in this way, although some human beings do have eyes of different colors.

We must think the following a sufficient cause of the eyes of the other animals, young or old, not noticeably changing, but of this occurring in the case of infants: in the former, this part is of one color, while in the latter it is of more than one color. On the other hand, of their being bluish and not having some other color, the cause is that the parts of young infants are weaker [than those of adults], and blueness is a sort of weakness.[293]

We must, however, get a universal grasp, as regards the differences in eyes, on the cause due to which some are blue, some grayish-blue, some greenish, and some dark. To suppose that the blue are fiery, as Empedocles says, while the dark contain more water than fire, and that because of this blue ones do not see sharply in the daytime, due to their deficiency of water, while the others do not do so at night, due to their

291. Literally, "like those of a goat."
292. Literally, "have one eye that is blue."
293. 779b21–34.

deficiency of fire, is not to state things correctly, if indeed [the organ of] sight consists in all cases not of fire but of water. Further, it is also possible to assign the cause for their colors in another way. Indeed, if it is as we stated previously in *De Sensu*, and prior to that in *De Anima*,[294] that this organ of perception is composed of water (and is composed of water and not of air or fire due to the specified cause), then this must be supposed to be the cause of [the eye colors] mentioned. For some eyes contain too much liquid, others too little, to be proportional to the movement, others the proportional amount.[295] Those, then, that contain too much liquid are dark because a large quantity of liquid is not easy to see through, while those that contain little are blue, as is also evident in the case of the sea; for the part of it that is easy to see through appears blue, the less so pale-gray, and the part that is not determined because of its depth appears black or dark-blue. As for the eyes intermediate between these, they differ at this point by the more and the less.

And the same cause, one must suppose, is also the cause of blue eyes not being as sharp-sighted in daytime, dark eyes at night. For blue ones, because of the small amount of liquid, are—insofar as they are liquid, that is, transparent—moved too much by the light and by visible objects. And seeing is the movement of this part insofar as it is transparent, but not insofar as it is liquid. Dark eyes, on the other hand, because of their large quantity of liquid, are moved less. For the light is weaker by night, and at the same time indeed liquid, in general, becomes more difficult to move in the night. The eye itself, then, must neither not be moved at all nor, insofar as it is transparent, be moved too much. For the stronger movement knocks aside the weaker one. That is why on changing from [looking at] strong colors people do not see, or on going out of the sun into the dark; for being strong, the movement preexisting in the eye hinders the one coming from outside—and, in general, neither strong nor weak sight is capable of seeing bright things because the liquid is affected and moved too much.

This is made clear too by infirmities of each sort of sight. For glaucoma occurs more often in those who are blue-eyed, what is called "night-blindness" in those who are dark-eyed. Glaucoma for its part is a sort of dryness of the eyes, which is why it occurs more in those who are getting old; for like the rest of the body these parts too become dry toward old age. Night-blindness, by contrast, is an excess of liquidity, which is why it occurs more often in the young; for the brain of these is more liquid. The one that is intermediate between little and much liquid is the best sight; for it is neither so small that it gets disturbed and hinders the movement of the colors, nor so large in quantity that it is made difficult to move.

But it is not only those stated that are causes of dullness or sharpness of sight, but also the nature of the skin on what is called the "eye-jelly"; for this must be

294. *Sens.* 2, *DA* $425^{a}3$–6.
295. $780^{a}1$–7.

transparent, and it is necessary for something of this sort to be fine-grained, white,[296] and even: fine-grained, in order that movement from outside may pass straight through; even, in order that its wrinkling not produce a shadow (for it is also because of this that old people do not have sharp sight—for like the rest of the skin that of the eye also becomes wrinkled and coarse-grained in old age); white, because black is not transparent—for this is what black is, the non-transparent. That is why even lanterns cannot give light if they are made of black skin.

In old age and during the diseases in question, then, these are the causes due to which sight is not sharp; but the eyes of children appear blue at first, because of the small quantity of their liquid.

And eyes of different colors come about especially in the human beings and horses due to the same cause as the one due to which the human being alone turns gray, and among the other animals the horse alone has hair that whitens noticeably in old age. For grayness is a sort of weakness and non-concoction of the liquid in the brain, as is blueness [of the eyes]; for very fine-grained and very coarse-grained liquid have the same capacity, the one as too little liquid, the other as too much liquid. When, then, the nature is incapable of producing an even result, whether by similarly concocting, or not concocting, the liquid in both eyes, but instead concocts the one and not the other, eyes of different colors come about.

The cause of some animals being sharp-sighted, and others not, is of two modes. For sharp is said of things in pretty much two ways (and this is the same way in hearing and smelling). For something is said to see sharply in one way when it is capable of seeing what is far away, in another way when it is capable of distinctly perceiving the differences in the things being seen. And these capacities do not occur together in the same individuals. In fact, the same individual, if he shades his eyes with his hand or looks through a tube, in no way discerns the differences in colors either more or less well, but he does see further. At any rate, from pits and wells people sometimes see even the stars.

So if any of the animals has brows projecting out a lot above its eyes, but the liquid in the eye-jelly is not pure or proportional to the movement from outside, and the skin on its surface is not fine-grained, this animal will not discern the differences in colors in an exact way, but it will be capable of seeing further better than those having their liquid and its covering pure, but having no brows at all projecting over the eyes. For of being sharp in this way, so as to distinctly perceive the differences in colors, it is in the eye itself that the cause lies; for just as on a pure [white] cloak even small stains are clearly visible, so in a pure organ of sight even small movements are clear and produce perception.

But of seeing things far away and of the movements coming to the eyes from objects far away, the position of the eyes is the cause; for animals with prominent eyes do not see well from far away, while those with eyes situated inside, in a cavity, are

296. I.e., clear.

able to see things at a distance because the movement is not dispersed into the open but comes straight to the eye. For it makes no difference whether we say, as some do,[297] that seeing is due to [the ray of] sight going out [from the eye] (for if there is nothing projecting over the eyes, it is necessary for the ray of sight to be dispersed, for less of it to fall on the things being seen, and for the ones far away to be seen less well) or that seeing is due to the movement coming from the things being seen. For in this case likewise, it is necessary for the sight to see due to movement. Things far away, then, would be seen best if there were a sort of continuous tube straight from the organ of sight to the thing being seen; for then the movement from visible objects would not be dispersed; otherwise, the further the tube extends, the more exact it is necessary for the seeing of faraway things to be. **781ᵃ1**

Let these, then, be the causes of the difference in eyes.

5.2
Sharpness of Smell and Hearing

It is the same way too as regards hearing and smell; for in one way hearing and smelling exactly is perceiving all the differences in the underlying perceptible objects and perceiving them all as well as possible, and, in another way, it is hearing and smelling from far away. Of discerning the differences correctly, then, the perceptual organ is the cause, as in the case of sight, depending on whether it itself and the membrane around it are pure.

For the ducts of all the perceptual organs, as was said previously in *De Sensu*,[298] run to the heart, or to its analog in animals that have no heart. That of hearing, then, since the perceptual organ is composed of air, comes to an end where the innate breath produces in some animals the beating of the heart and in others breathing.[299] It is because of this too that learning from what is said comes about in such a way that we echo what we have heard; for in these cases the movement that entered through the perceptual organ is of the sort that occurs again, since it is, as it were, of one and the same stamp as the movement that comes about because of the voice, so that one says what one heard. Also, people hear less well while yawning or exhaling than when inhaling, because the starting-point of the perceptual organ of hearing is situated near the breathing part[300] and is shaken and moved at the same time as the instrument[301] moves the breath; for while moving it, the instrument is itself moved. (And in wet seasons and blends [of the surrounding air] the affection is the same.) The ears too

297. Empedocles (*Sens*. 437ᵇ26–438ᵃ2), Plato, *Timaeus* 45b–46c, 67e–68b.
298. Not in our *De Sensu*. See *Juv*. 469ᵃ10–16.
299. Secluding καὶ εἰσπνοήν.
300. Presumably, the lungs.
301. I.e., the perceptual organ.

seem to be filled with breath because of being a neighbor, due to the starting-point, **781[b]1** of the breathing place.[302]

Exactness in discerning the differences of sounds and smells, then, depends on the purity of the perceptual organ and of the membrane on its surface; for then all the movements are distinguished in their cases too, as in the case of sight.

Perception and non-perception from far away also occur in the same way as in the case of sight. For animals that have, as it were, passages a long way in front of the organs of perception that pass through the relevant parts are the ones capable of perceiving from far away. That is why all animals whose nostrils are long, like Laconian hounds,[303] are sharp-scented; for since the organ of perception is high up, movements from far away are not broken up but go straight through, which is just what happens when we shade our eyes with our hands. It is likewise too in the case of those animals whose ears are long and jut far out like the eaves of a house, of the sort some four-footed animals have, and within which the helical passage is long; for these too catch the movement from afar and deliver it to the organ of perception.

Among animals in proportion to their size, exactness of the perceptual modalities from far away is possessed (one might almost say) least in the human being, but as regards differences, he is the most capable of all of perceiving them well. The cause is that the organ of perception is pure, that is, least earthen and body-like, and by nature, among animals with respect to size, man has the finest-grained skin.[304]

In matters concerning the seal too, nature has produced things in a reasonable way; for although it is a live-bearing four-footed animal it has no ears, but ducts alone. The cause of this is that its life is spent in a liquid. For the ears are a part added to the ducts to preserve the movement of the air from far away. They are of no use to it, then, but rather would even produce the contrary result by receiving a quantity of water into itself.

Seeing, hearing, and smelling have now been spoken about.

5.3
Hair (1)

As for various sorts of hair, the human beings differ in this themselves in accord with their times of life, and also from whatever kinds of other animals have hair. And those that have it are pretty much all the internally live-bearing ones; for even the spiny ones among these must be considered as having a form of hair—for example, the spines of hedgehogs and of any other of this sort that is among the live-bearing ones.

302. Reading τῇ ἀρχῇ τοῦ πνευματικοῦ τόπου.
303. *HA* 6.20.
304. The fine-grainedness of human skin presumably carries over to the membrane on the surface of this organ (781[b]3–4).

Hairs differ with respect to hardness and softness, length and shortness, straightness and curliness, abundance and sparseness, and in addition to these, with respect to their colors, whiteness and blackness, and the ones intermediate between these. In the case of these differences animals also differ in accord with their times of life, in their youth and in a more advanced age. This is especially noticeable in the case of the human beings; for in fact the hair gets coarser as age advances, and some go bald in the front of the head. Certainly, when they are children, they do not go bald, nor do women, but men do so by the time they begin to age. Also, the human beings go gray on the head as they grow old, while this (one might almost say) never noticeably occurs in any of the other animals; among the others, the horse does so most. Also, though the human beings go bald on the front of their head, they go gray on the temples first; no one goes bald, however, on these or on the back of the head. As for those animals that do not have hair but its analog, for example, the birds have feathers, and the fish kind have scales, in them too some of these sorts of affections come about, in accord with the same account. **782[a]1**

What nature has produced the kind of hair for the sake of in animals has been spoken about previously in the causes pertaining to the parts of animals.[305] But to make clear due to what preexisting things and what necessities each of these kinds occurs belongs to the present methodical inquiry.

Of hair being coarse or fine, then, the principal cause is the skin; for in some animals it is coarse-grained, in others fine-grained, and in some open-textured, in others dense. Further, a contributing cause is the difference of the included liquid; for in some it is oily, in others watery. For, in general, the underlying nature of the skin is earthen; for, being on the surface, it becomes solid and earthen as the liquid evaporates. But both hair and its analog come not from the flesh but from the skin, when the liquid evaporates and is exhaled in them. That is why coarse hair comes from coarse-grained skin, fine hair from fine-grained skin. If, then, the skin is more open-textured and more coarse-grained, the hair is coarse because of the large quantity of earthen material and because of the large size of the ducts [or pores], while if it is denser, they are fine because of the narrowness of the pores. Further, if the wet secretion is watery it dries up more quickly and the hairs do not get large in size, but if it is oily, the contrary occurs; for what is oily does not easily get dry.[306] **782[b]1**

That is why animals with more coarse-grained skin generally have hair that is coarser. Nonetheless, the ones with skin that is most coarse-grained do not have hair that is coarser [than others with such skin], due to the causes stated—for example, the pig kind in relation to the cow kind, the elephant kind, and many others. And due to the same cause too the hair in the human beings is most coarse on the head; for the skin on it is the most coarse-grained and lies over a very great quantity of liquid, and furthermore is very open-textured.

305. *PA* $658^{a}18–19$.
306. *Mete*. $383^{b}33–384^{a}2$.

The cause of the hair being long or short[307] is the evaporating liquid not being [or being] easily dried up. And of its not being easily dried up there are two causes: its quantity and its quality; for if the liquid is large in amount, it does not dry up easily, nor if it is oily. And because of this, in the human beings the hair coming from the head is longest; for the brain, being wet and cold, provides an abundance of liquid.

Straight hair and curly hair are due to the exhalation in the hair; for if it is smoky, it is hot and dry and makes the hair curly. For the hair gets bent due to being spatially moved with two spatial movements; for the earthen [dry] part spatially moves downward, the hot upward. And being easily bent because of its weakness, it gets twisted. And this is what curliness of the hair is. It is possible, then, to grasp the cause in this way, but it is also possible that, because of containing little liquid and much earthen material, it gets dried due to the surrounding air and curls up. For what is straight becomes bent if its liquid evaporates and it shrinks up like hair burning on a fire, implying that curliness is a contraction because of a deficiency of liquid due to the surrounding heat. A sign of this is the fact that curly hair is harder than straight; for a dry thing is hard. And those animals that have a lot of liquid are straight-haired; for the liquid advances in them as a stream, not in drops. And that is why the Scythians on the Black Sea and the Thracians are straight-haired; for both they themselves and the air surrounding them are wet, while the Ethiopians and those in hot countries are
783ᵃ1 curly-haired; for their brains and the surrounding air are dry.

Some of the animals with coarse-grained skin, however, have fine hair, due to the cause stated; for the finer the ducts [or pores] are, the finer it is necessary for the hair to be. That is why the sheep kind has such hair; for wool is a large number of hairs.

And there are some animals whose hair, though soft, is less fine—for example, what happens to the hare kind compared to that of the sheep. For the hair of such animals is on the surface of the skin[, not deeply rooted in it]. That is why it is not long but is much the same as the scrapings from linen cloths; for these too have no length, but are soft and cannot be used for weaving.

Sheep in cold climates are affected in the contrary way to the human beings; for while the Scythians are soft-haired, Sarmatian sheep are hard-haired. The cause of this is the same as in the case of all wild beasts. For the cold hardens and solidifies by drying; for as the heat is squeezed out, the liquid evaporates with it, and both the hair and the skin become earthen and hard. The cause in the case of wild beasts is their outdoor life, while in the others it is the place being of the sort it is. A sign of this is also what happens in the case of sea urchins that are used to treat stranguries.[308] For these too, though small themselves, have long, hard spines due to the fact that the sea they are in is cold because of its depth (for they are found at sixty fathoms and even more). The spines are long, because the growth of the body is diverted to them (for being animals that are low in heat, and so not concocting the nourishment very

307. Reading ἢ βραχείας.
308. *HA* 530ᵇ9–10.

much, they contain a lot of residue, and the spines, the hair, and things of this sort come to be from residue), while they are hard and petrified because of the cold and its solidifying effect. In the same way plants too are harder, earthier, and more petrified in north-facing or windy locations than in south-facing or sheltered ones; for they all get more chilled and their liquid evaporates.

Something is hardened, then, both by heat and by cold; for the liquid is evaporated due to both—intrinsically by heat, coincidentally by cold (for the liquid goes out along with the heat;[309] for there is no liquid without heat). But while cold not only hardens but condenses [things], heat makes them more open-textured. **$783^{b}1$**

Due to the same cause, as animals grow older, the hair becomes harder in those that have hair, and the feathers and the scales in the feathered and the soft-scaled ones. For their skins become harder and more coarse-grained as they get older; for they become dry, and old age (*gêras*), in keeping with its name, is earthen (*geêron*) because the heat is failing and the liquid along with it.

Most of all the animals, the human beings go noticeably bald, although an affection of this sort is something universal; for among the plants too, some are evergreen, others deciduous, and among the birds, the ones that go into hiding shed their feathers. Baldness in the case of the human beings who happen to go bald is an affection of this sort; for a partial shedding of leaves occurs in all the plants, and of feathers and hair in those that have them, but it is when this affection comes about in all these at once that it gets the names just mentioned; for then something is said to go bald, shed its leaves, or molt. The cause of the affection is a deficiency of hot liquid, and the oily ones among the liquids are most of all of this sort. That is why among the plants the oily ones are more evergreen. (But the cause of this must be spoken about elsewhere;[310] for there are in fact other contributing causes of this affection in these.) And it is in winter that the affection occurs in plants (for this change of season has more control than time of life), and in animals that go into hiding (for these too are in nature less hot and wet than the human beings). The human beings, on the other hand, pass through winter and summer in correspondence with their ages.

That is why, before the time of sexual intercourse, no one becomes bald; at that time, baldness appears in those whose nature is more lecherous. For by nature the brain is the coldest part of the body, and sexual intercourse makes one cold; for it is in fact the secretion of pure natural heat. Quite reasonably, then, the brain feels the effect of it first; for when things are weak and in poor condition, small causes shift the balance. So if one reckons up that the brain itself is low in heat, further, that it is necessary for the skin around it to be more so, and for the nature of the hair to be more so than the skin, inasmuch as they are farthest away, it would seem reasonable for it to happen to those with much seed that they go bald around this time of life.

309. *Mete*. $379^{a}23–24$.
310. In the lost treatise on plants ($716^{a}1$, $731^{a}29–30$).

And it is due to the same cause too that the front part of the head alone goes bald
784ᵃ1 and, among the animals, in the human beings alone: the front part, because the brain is there; alone among the animals, because the human being has much the largest and wettest brain. And women do not go bald because their nature is much the same as
5 that of children; for both are non-productive of spermatic secretion. Also, eunuchs do not become bald because they change to the female condition. And the hair that comes later in life, eunuchs either do not grow it or they lose it if they happen to, except for pubic hair. Women, in fact, either do not have it or it grows in the pubic
10 area. This deformation is a change from the male condition to the female.

As for the animals that go into hiding becoming hairy again and leaf-shedding plants growing leaves again, but in cases of baldness the hair not growing back again, the cause is that for the former the seasons of the year are the turning-points of their body more so [than in the human beings], so that since these seasons change, they
15 change with them by growing and losing feathers or hair, and the plants their leaves. In the case of the human beings, on the other hand, winter, summer, spring, and fall correspond to their ages, so that since the times of life do not change, neither do the
20 affections change that are due to these, although the cause is similar.

And [color aside] the other affections of the hair have now been spoken about.

5.4
Hair (2)

The cause of their colors in the other animals, and of their being single-colored or many-colored, is the nature of the skin. But in the human beings it is not the cause,
25 except of their hair going gray, not due to old age, but due to disease; for in what is called "white sickness" the hair becomes white, while if the hair is white because of old age, whiteness in the skin does not follow along. The cause is that the hair grows from the skin. If the skin from which they grow is diseased and white, then, the
30 hair is diseased along with it, and the disease of hair is grayness. But the grayness of hair that is due to time of life comes about due to weakness and deficiency of heat; for every time of life shifts the balance of the body's decline, in old age toward cold; for old age is cold and dry.

We must understand, however, that the nourishment reaching each part is con-
35 cocted by the proper heat present in each part, and that if the heat is incapable of
784ᵇ1 doing so, the part is destroyed, and deformation or disease results. (This sort of cause must be spoken about in a more exact way later on in the treatise *On Growth and Nourishment*.[311]) In those human beings, then, in whom the nature of the hair is low in heat and too much liquid enters, the proper heat is incapable of concocting it and
5 the hair becomes putrefied due to the heat in the environment. For all putrefaction

311. *PA* 650ᵇ10.

comes about due to heat, but not—as was said elsewhere[312]—due to innate heat. Putrefaction occurs in the case of water, earth, and all bodies of this sort, which is why it also occurs in the case of earthen vapor—for example, what is called "mold"; for mold too is in fact a putrefaction of earthen vapor. So, in hair too this sort of nourishment, because of not being concocted, putrefies and what is called "grayness" results. It is white because mold too, alone (one might almost say) among putrid things, is white.

The cause of this is that it contains much air; for all earthen vapor has the capacity of coarse-grained air.[313] For mold is like the counterpart of hoar-frost; for if the vapor that rises up solidifies, it becomes hoar-frost. If it putrefies, it becomes mold. That is why too both are on the surface of things; for vapor forms on the surface. Also, the poets make a good metaphor[314] when jestingly calling gray hair "mold of old age" and "hoar-frost." For the one is the same in kind, and the other in form: hoar-frost in kind (for both are a vapor), mold in form (for both are a putrefaction).

Here is a sign that going gray is a thing of this sort: in fact, as a result of diseases too many people grow gray hair, but later on, when they become healthy, grow black ones instead of these. The cause is that in sickness, just as in the whole body there is a deficiency of natural heat, so too the various parts, even the very small ones, share in this sickness. And much residue occurs in their bodies and in the parts. That is why the non-concoction of the residue in the flesh produces gray hair. But when they become healthy and strong, they again change and, as it were, from being old become young, and the affections change accordingly. And one might even correctly say that disease is an additionally acquired old age, old age a natural disease. At any rate, some diseases produce the same effects as old age.

The temples go gray first. For the back of the head is empty of liquid because it does not have a brain in it, while the bregma contains a large quantity of liquid—and **785ᵃ1** a large quantity does not easily putrefy. The hairs on the temples, however, have neither so little liquid as to concoct nor so much as not to putrefy; for since this place on the head is intermediate between the two others it is exempt from both affections.

As regards the grayness of the hair of human beings, then, the cause has now been stated.

5.5
Hair (3)

In other animals the cause of this change not noticeably occurring due to time of life is precisely the same one that was also stated in the case of baldness: their brain is small and contains less liquid, so that the heat is not entirely incapable of effecting

312. *Mete*. 379ᵃ16–18.
313. *Mete*. 340ᵇ24–26.
314. *Rh*. 1405ᵃ35–36.

its concoction. In horses, of all the animals we know, signs of it most appear, because the bone they have around the brain is thinner than that of all the others. A proof of this is that a blow to this place is fatal to them. That is why Homer too has put things as follows:

> There where the first hair of a horse's
> Skull grow is a place most mortal.[315]

Hence the flow of the liquid [to this hair] is easier because of the thinness of the bone, and as the heat fails because of age, this hair goes gray. And reddish hair goes gray faster than black hair; for redness too is a sort of sickness of the hair, and all weak things age more quickly.

The cranes are said to go darker as they get older. The cause of this affection would be that the nature of their feathers is more liquid[316] by nature, and as they grow old there is more liquid in their feathers than is easily putrefied.

A sign that grayness occurs due to a sort of putrefaction, and that it is not, as some people think, a drying-up, is that hair protected by hats or other coverings goes gray faster (for winds prevent putrefaction, and the protection produces an absence of wind), and that anointing them with a mixture of water and oil is a help. For while the water cools them, the oil mixed with it prevents them from drying quickly; for water is quickly dried up. A sign that it is not a drying-up, that hair does not whiten as grass does by drying-up, is that some hair grows gray from the outset, and nothing that is dried-up grows. Many hairs too are white at the tip; for it is into the extremities and thinnest parts that the least heat comes.

785[b]1 In the other animals, when the hair is white, this occurs by nature and does not come about by virtue of an affection. And the cause of the colors in the others is their skin; for if they are white, the skin is white, if they are dark, it is dark, and if they are piebald, and come to be from a mixture, it is seen to be white in the one part, dark in the other. But in the case of the human beings, the skin is in no way a cause; for even white-skinned ones have very dark hair. The cause is that, for its size, the human being has the finest-grained skin of all the animals, which is why it has no strength for changing the hair. Instead, because of its weakness, the skin itself also changes its color and becomes darker due to the sun and the winds, while the hair does not change together with it. In the other animals, however, the skin, because of its coarse-grainedness, has the capacity of the region.[317] That is why the hair changes in accord with the skin, but the skin does not change in accord with the winds and the sun.

315. *Iliad* 8.83–84.

316. Reading ὑγροτέραν.

317. I.e., the capacity to influence the color of hair, which itself depends in part on diet and environment (767[a]28–32).

5.6
Color of Animals

Among the animals, some are single-colored (and by "single-colored" I mean the ones whose whole kind has one color, for example, all lions are tawny, and this also applies to the birds, the fishes, and the other animals in a similar way); others, though many-colored, are whole-colored (I mean those whose whole body has the same color, for example, the cow is wholly white or wholly dark); others variegated. This latter is twofold; sometimes it applies to the kind, for example, the leopards, the peacocks, and some of the fishes, for example, the ones called *thratta*,[318] but sometimes, though the entire kind is not variegated, variegated offspring come to be, for example, the cows and the goats, and, among the birds, for example, the common pigeons. And other kinds of birds are affected in the same way.

The whole-colored animals exhibit change much more than the single-colored ones, both to the simple color of the others (for example, from white parents a dark [offspring] comes or from dark parents a white offspring) and from both parents of both colors, mixed offspring come. This is because it is in the nature of the whole kind not to have [only] one color; for the kind is easily moved in both directions, so that it exhibits change more both to [the color] of the others and to being variegated.

The single-colored, on the other hand, exhibit the contrary; for they do not exhibit change except due to an affection, and this rarely; for a white partridge, raven, sparrow, and bear are known to have been observed. This results from its being distorted in the process of generation; for what is small is easily destroyed and easily moved, and what is coming to be is of this sort; for the starting-point of things that are coming to be lies in something small.

And the ones that exhibit the most change are those which, though by nature whole-colored, are in kind many-colored, due to the waters [they drink];[319] for hot waters make the hair white, cold ones make them dark, just as in the case of plants. The cause is that the hot ones contain more breath than they do water, and the air shining through produces whiteness, as it also does in foam. Hence just as skins that are white due to an affection differ from skins that are white due to nature, so too in hair the whiteness due to disease or time of life differs from the whiteness of hair due to nature, in that the causes are distinct; for the natural heat produces the whiteness of the latter, alien heat that of the former. And whiteness is produced in all things by the vaporized air enclosed in them. That is also why those animals that are not single-colored are all white under the abdomen. For (one might almost say) all white animals are hotter and have more pleasant-tasting flesh due to the same cause; for the concoction produces the pleasant taste, and the heat produces the concoction. And the cause is the same for the ones that are single-colored, but either dark or white;

318. Perhaps the same as the *thritta* mentioned at *HA* $621^{b}16$.
319. $767^{a}28$–32.

for heat and cold are the causes of the nature of the skin and the hair; for each of the parts has its own proper heat.

Further, tongues differ among simple-colored and variegated animals, and among those that though simple-colored differ in color—for example, white ones and dark ones. The cause is the one stated previously,[320] that the skins of the variegated ones are variegated, and those of white-haired ones and of the dark-haired ones are white and dark, respectively. We must suppose the tongue to be, as it were, one of the external parts, not supposing that it is covered by the mouth, but rather that it is like a hand or a foot. So, since the skin of the variegated animals is not single-colored, this is also the cause in the case of skin on the tongue.

Some of the birds and some of the wild four-footed animals change their colors in accord with the seasons. The cause is that just as the human beings change in accord with the time of life, this change happens to them in accord with the seasons; for this is a greater difference for them than the turn in accord with age.

The more omnivorous animals are more variegated, to speak in terms of what holds for the most part, and reasonably so—for example, the bees are more single-
786[b]1 colored than the hornets or the wasps; for if the nourishments are the causes of the change, it is reasonable for variegated nourishments to produce all sorts of movements and all sorts of residues of the nourishment from which the hair, the feathers, and the skin come to be.

Concerning both colors and hair, then, let things be determined this way.

5.7
Voices of Animals

As regards the voice, it is low-pitched in some animals, high-pitched in others, and in others again well pitched and having a relation to both extremes that is proportional; further, some have a big voice, others a small voice, and it differs in smoothness and roughness, in flexibility and inflexibility—it must be investigated, then, due to what causes each of these belongs to a voice.

As regards highness and lowness of pitch, we must think the cause to be the very same one as in the case of the change from youth to age. For all the other animals when young emit a higher-pitched sound, but among cows, the calves emit a lower-pitched one. The same happens in the case of males and females. For, in the other kinds of animals, the female emits a higher-pitched sound than the male (this is most noticeable in the case of the human beings; for it is most of all to these that nature has assigned this capacity, because they alone among the animals make use of speech, and the matter of speech is voiced sound), but in the case of cows the contrary obtains; for the females emit a lower-pitched sound than the bulls.

320. 785[b]2–6.

What animals have a voice for the sake of, and what a voice is, and, in general, a sound, has been stated partly in *De Sensu*, partly in *De Anima*.[321] But since low-pitch in a voice lies in the movement[322] being slow, and high-pitch in its being fast, whether the cause is the mover or the moved involves a certain puzzle. For some people say that what is much is moved slowly, what is little quickly, and that this is the cause of lowness and highness of pitch, respectively. Up to a point this is correctly stated, but not wholly correctly. For, as regards the kind, it seems correctly said that lowness of pitch lies in what is moved being of a certain size. If it were so, however, it would not be easy to emit a sound that is both small and low-pitched, nor, similarly, one that is big and high-pitched. Also, a low-pitched voice seems to be characteristic of a nobler nature,[323] and in melodies what is low-pitched is better than what is strained;[324] for being better lies in being superior, and lowness of pitch is a sort of superiority. But since the low-pitched and high-pitched in a voice are distinct from big-voiced and small-voiced (for there are animals that are both high-pitched-voiced and big-voiced, and likewise ones that are small-voiced and low-pitched-voiced), and similarly too with respect to the pitch intermediate between these—by what else about these could one distinguish them (I mean bigness and smallness of voice) except the large or small quantity that is moved? If, then, high and low pitch are distinguished in accord with what is said [by the people in question], the result will be that the same animals are low-pitched and big-voiced, high-pitched and small-voiced. But this is false.

The cause [of the puzzle] is that big and small, much and little, are sometimes said of things unconditionally, at other times, in relation to each other. Bigness of voice, then, lies in what is moved being unconditionally much, smallness of voice in its being unconditionally little, while low-pitch and high-pitch depend on exhibiting this difference in relation to each other. For if what is moved exceeds the strength of what moves it, it is necessary for what is spatially moved to be spatially moved slowly; if it is exceeded, quickly.[325] Sometimes, then, the strong, moving much because of its strength, produces a slow movement, other times, because of its superiority, a quick one. In accord with the same argument too, sometimes weak movers, moving what is for their capacity much, produce a slow movement, but other times, moving little because of their weakness, a quick one.

These, then, are the causes of the contrarieties: of not all young animals having high-pitched voices or low-pitched ones, nor all the older ones, nor males and females; and in addition to this, of both the sick and those having a body in a good condition emitting high-pitched sounds; and further too, of people, as they approach

321. *Sens*. 437^{a}10–17, *DA* 420^{a}23–26, ^{b}27–29.
322. I.e., of air (787^{a}29).
323. *NE* 1125^{a}12–16.
324. As one must strain one's vocal cords (or tighten an instrument's strings) in order to reach high notes.
325. *Ph*. 250^{a}4–9.

old age, getting a more high-pitched voice, though this time of life is the contrary of youth.

Most young animals, then, and most females, moving little air because of their incapacity, have high-pitched voices; for the little air is spatially moved quickly, and in a voice what is quick is high-pitched. But in calves and female cows, in the one case because of time of life, in the other because of the nature of the female, the part by which they move [the air][326] does not possess strength, but because they move much air, they emit low-pitched sounds; for what spatially moves slowly is heavy [or low], and much air spatially moves slowly. These animals move much [air], but the others move little, because the vessel through which the breath first spatially moves has in them a large opening and is compelled to move much air, while in the others it is easily regulated.[327] And as their time of life advances, this part that does the moving in each animal becomes stronger, so that they change to their contrary, and the ones with high-pitched voices come to have lower-pitched ones that they had, and the ones with low-pitched voices come to have higher-pitched ones. That is why bulls have a higher-pitched one than calves and female cows.

In all animals, strength lies in the sinews, which is why those in the prime of life are stronger; for the young are more unarticulated and more without sinews. Further, in the young they are not yet tight, while in the old the tightness by then slackens. That is why both are weak and lacking in capacity for movement. Bulls are especially sinewy, even their heart. That is why the part by which they move the breath has tension, just like a string made of sinew that is stretched tight. What makes it clear that the heart of male cows has this sort of nature is the fact that a bone actually occurs in some of them. And bones seek the nature of sinews.[328]

When castrated, all animals change to the female condition and, because of the slackening of the sinewy strength in its starting-point, emit a voiced sound similar to that of the females. The slackening is much the same as if one were to stretch a cord and make it tight by hanging some weight on it, as women do who weave at the loom; for they too stretch the warp by attaching what are called "loom stones" to it. For this is how the nature of the testicles too is attached to the spermatic ducts, and these to the blood vessel whose starting-point is at the heart near the part that moves the voice. That is why as the spermatic ducts change near the age at which they are then able to secrete seed, this part also changes along with them. And when this changes, the voice too changes, and though it changes more in males, the same also happens in the case of females, though in a less obvious way, and what some people call "bleating like a goat" results, when the voice is uneven. After this it settles into the low-pitched or high-pitched voice of the succeeding time of life. But if the testicles are removed, the stretching of the ducts slackens as when the weight is removed from

326. The windpipe.
327. 788[a]28–34.
328. The bones are "bound together" by sinews (*PA* 654[b]19) and so could not do their work, or be living bones, without them.

the cord and the warp. And as this slackens, the starting-point that moves the voice is proportionally released.

It is due, then, to this cause that castrated animals change to the female condition, both in voice and in the rest of their shape, because of the resulting slackening of the starting-point from which the tension of the body originates, not, as some suppose, because the testicles themselves are a ganglion of many starting-points. On the contrary, small changes are causes of big ones, not due to themselves, but rather when it happens that a starting-point changes along with them. For starting-points, though small in size, are great in capacity; for this is what it is for something to be a starting-point, that it is itself the cause of many things, with nothing else above it being a cause of it.

The hotness or coldness of their place [of habitation] also contributes to some animals being so composed by nature as to have in some cases low-pitched voices and in others high-pitched ones. For hot breath, because of being coarse-grained, produces lowness of pitch in a voice, while cold, because of being fine-grained, produces the contrary. This is clear too in the case of pipes; for those who use hotter breath, and emit it in the same way as people who are groaning, play at a lower pitch.

The cause of roughness and smoothness of voice, and of all unevenness of this sort, is that the part of the instrument [or organ] through which the voice spatially moves is rough or smooth, or, in general, even or uneven. This is clear when there is any wetness about the windpipe, or when it becomes rough due to some affection;[329] for then the voice too becomes uneven.

Of flexibility and inflexibility of voice the cause is the instrument's [or organ's] being soft or hard; for a soft one is capable of being regulated and becoming of any and every sort, while a hard one is incapable of this. And a soft one is capable of emitting both a small and a big sound. That is why it can be both high-pitched and low-pitched; for it easily regulates the breath, easily becoming big or small itself. But hardness cannot be regulated.

About whatever things having to do with voice that were not previously determined in *De Sensu* and in *De Anima* let this much be said. **$788^{b}1$**

5.8
Teeth of Animals

As regards the teeth, it has been stated previously[330] that they are not for the sake of one thing, nor do all animals have them for the sake of the same thing, but rather some have them because of their nourishment, others also for strength and for speech by means of the voice. But why the front teeth come to be first and the molars later,

329. E.g., phlegm, hoarseness.
330. *HA* $501^{a}8$–$^{b}5$, *PA* $655^{b}8$–11, $661^{a}34$–$^{b}27$.

and why the latter are not shed, while the former are shed and grow again—it is the accounts concerned with generation that must consider the innate cause of these things.

About these things Democritus too has spoken, but he has not spoken correctly; for he states a universal cause without having investigated all cases. For he says that the shedding is due to the fact that the teeth come to be prematurely; for it is when animals are (one might almost say) in their prime that the teeth grow in accord with nature, while of their coming to be prematurely suckling is the cause assigned. And yet the pig also suckles but does not shed its teeth.[331] Further, sawtoothed animals[332] all suckle, but some of them do not shed any teeth except the canines—for example, the lions. Democritus made this error, then, in speaking universally without investigating what happens in all cases. But this is what we must do; for it is necessary for the one who speaks universally to say something about all cases.

Since we assume, making our assumption on the basis of what we observe, that nature neither omits any of the things possible in each case nor produces any pointlessly, and since it is necessary, if an animal is going to get any nourishment after being weaned, for it to have instruments for work on nourishment—if, then, as Democritus says, this happened around the time of maturity, nature would omit one of the things it was possible for it to produce, and the work of nature would be contrary to nature. For what is by force is contrary to nature, but he says that the generation of the [first] teeth is by force. But that this is not true is evident from these considerations and others of this sort.

These [front] teeth come to be before the broad ones, first because their work is earlier (for dividing comes before crushing, and the broad ones are for crushing, the others for dividing), and next because what is smaller, even if begun at the same time, naturally comes to be faster than what is larger. And these teeth are smaller in
789ᵃ1 size than the molars, because the bone of the jaw is broad there but narrow near the mouth. Of necessity, then, more nourishment flows from the larger part, less from the narrower one.

But though suckling itself contributes nothing [to the teeth], the hotness of the milk makes them sprout more quickly. A sign of this is that even in suckling animals those that get hotter milk grow their teeth faster; for what is hot is productive of growth.

Teeth are shed after coming to be, however, for the sake of the better, because what is sharp is quickly blunted. Another set must be provided, then, for the work. The broad ones, by contrast, cannot be blunted, but due to being pounded as the time passes, only become ground down. Of necessity, on the other hand, they are shed because, while the roots of the molars are situated where the jaw is broad and the bone strong, those of the front teeth are in a thin part, which is why they are

331. It does in fact shed its teeth.
332. *HA* 501ᵃ18–19.

weak and easily moved. And they grow again because they are shed while the bone is still growing and while it is still the time of life for teeth to come to be. A sign of this is that even the broad ones grow for a long time; for the last ones emerge at around twenty years of age. In some cases, indeed, people are quite aged by the time their last teeth are fully grown. This is because there is much nourishment in the wide part of the bone, while the front part, because of its thinness, quickly reaches completion, and residue no longer occurs in it; instead, the nourishment is used up for its own growth.

Democritus, however, omitting to mention the for-the-sake-of-which, reduces to necessity all that nature uses—but though they are such, they are nonetheless for the sake of something and in each case for the sake of what is better. So nothing prevents the teeth from coming to be and being shed in the way he says, but it is not because of these things, but rather because of the end. These things are causes, but as movers, as instruments, and as matter, since it makes perfect sense, indeed, for nature to make most things using breath as instrument—for just as some things have many uses in the crafts, as in blacksmithing are the hammer and the anvil, so too does breath in those composed by nature. Saying that the causes are [all] of necessity, however, seems similar to someone thinking that it is because of the surgeon's knife alone that water is drawn from a dropsical patient, and not because of his being healthy, for the sake of which the knife made the cut.

The teeth, then, and why some are shed and come to be again, and, in general, due to what cause they come to be, have now been spoken about. And we have also spoken about the other affections of the parts that come about not as the result of a for-the-sake-of-something, but of necessity and because of the moving cause.

— VOLUME 2 —

METAPHYSICS*

BOOK 1 (ALPHA)

1.1
Theoretical Wisdom as a Science Concerned with Primary Causes and Starting-Points

All human beings by nature desire to know. A sign of this is our liking for the perceptual modalities; for even apart from their use, these are liked because of themselves—and most of all the one in virtue of the eyes.[1] For it is not only in order to do an action, but even when we are not going to do anything whatever, that we choose sight over (one might almost say) all the others. The cause is that, of the perceptual modalities, this one most of all makes us know and makes clear many differences. 980ª20 25

Animals are by nature born with perception. In some of them, memory does not come about from this, but in others it does come about. And because of this, some are practically wise and others better at learning[2] than those incapable of remembering. Practically wise, but outside the reach of teaching, are those that cannot hear sounds (for example, bees[3] and whatever other animal kind may be like them), while those that in addition to memory have this perceptual modality can be taught. 980ᵇ20 25

The other animals live by appearances and memories, and have but a small share in experience, while humankind lives also by craft knowledge and by rational calculations. From memories experience comes about in human beings; for many memories of the same thing finally bring about the capacity of one experience. Indeed, experience seems pretty much similar to scientific knowledge and craft knowledge. But scientific knowledge and craft knowledge come to human beings through experience; for "experience made craft," as Polus correctly says, "and lack of experience, luck." **981ª1**

Craft knowledge comes about when, from many intelligible objects belonging to experience, one universal supposition about similar things comes about. For to have a supposition that when Callias was sick with this disease this treatment benefited him, and similarly with Socrates and many other particular cases, is a matter of experience. 5

* Translated by C. D. C. Reeve. Text (unless otherwise indicated): W. Jaeger, *Aristotelis Metaphysica* (Oxford, 1957).

1. F90 45.1.

2. Reading τὰ μὲν φρόνιμα τὰ δὲ μαθητικώτερα.

3. Cf. *HA* 627ª15–19.

But to suppose that it benefited everyone of a certain sort, marked off by a single form, suffering from a certain disease (for example, phlegm-filled or bilious people when burning with a fever), is a matter of craft knowledge.

With a view to action, then, experience seems no different from craft knowledge—on the contrary, we even see experienced people being more successful than those who have an account but are without experience. The cause of this is that experience is knowledge of particulars, while craft knowledge is of universals, and actions and productions are all concerned with particulars; for the doctor does not cure humankind, except coincidentally, but Callias or Socrates or someone else spoken of in that way,[4] who happens to be a human. If, then, someone without experience has the account and knows the universal, but does not know the particular included under it, he will often make an error in treatment; for it is the particular that admits of treatment.

Nonetheless, we think that knowledge and comprehension belong to craft rather than to experience, and that craftsmen are wiser than experienced people, on the supposition that in every case wisdom follows along with knowledge rather than with experience. That is because craftsmen know the cause, while experienced people do not. For experienced people know the that but do not know the why, while craftsmen know the why, that is, the cause.

It is also because of this that we consider the architectonic practitioners in each case to be more estimable, to know in a yet more full sense, and to be wiser than the handicraftsmen, because they know the causes of the things they produce. The handicraftsmen, by contrast, we consider to be like some sort of inanimate things that produce without knowing the things they produce, in the way, for example, that fire burns. But while inanimate things produce each result by a sort of nature, the handicraftsmen do so by habit—the supposition being that architectonic craftsmen are wiser not in terms of being practically efficient, but in terms of having the account themselves and knowing the causes. And, in general, a sign of the person who knows, as opposed to the person who does not know, is his capacity to teach. That is why we think that craft knowledge is more like scientific knowledge than experience is; for craftsmen can teach, while experienced people cannot.

Further, we do not think that any perceptual modalities whatever constitute wisdom, and yet they are most in control of the knowledge of particulars, at any rate. Still, they do not tell us the why of anything (for example, why fire is hot), but only that it is hot.

At first, then, anyone who discovered any sort of craft that went beyond the common perceptual modalities was quite likely wondered at by people, not only because there was something useful in his discoveries, but also because he was thought wise and superior to others. But as more crafts were discovered, some of which were related to necessities, others to passing the time, it is quite likely that the discoverers of the

4. I.e., by means of a proper name.

latter were always supposed to be wiser, because their sciences did not aim at use. When all such crafts were already developed, the sciences that aim neither at pleasure nor at necessities were discovered, first in the places where people had leisure. That is why the mathematical crafts first arose in Egypt, for there the priestly class were allowed to be at leisure.

It was stated in the *Ethics*[5] what the difference is between craft knowledge, scientific knowledge, and other things of the same kind. What our present account is for the sake of, however, is this. Everyone supposes that what is named "wisdom" is concerned with the primary causes and the starting-points. So, as was said previously, the person of experience seems wiser than those who have any perceptual modality whatever, a craftsman than experienced people, an architectonic craftsman than a handicraftsman, and theoretical sciences than productive ones. **982^{a}1** It is clear, then, that theoretical wisdom is scientific knowledge of certain sorts of starting-points and causes.

1.2
Theoretical Wisdom as the Science of God

Since this is the science we are seeking, what must be investigated is the following: what sorts of causes and what sorts of starting-points is theoretical wisdom the scientific knowledge of. If one got hold of the suppositions we have about the theoretically wise person, perhaps the answer would thereby become more evident.

First, then, we suppose that wise person has scientific knowledge of all things, insofar as they admit of it, without his having scientific knowledge of each of them. Next, that the person is wise who has the capacity to know difficult things, that is, things that are not easy for human beings to know; for perception is common to all, which is why it is easy and involves no wisdom. Further, that someone is wiser in any science if he has a more exact knowledge of it and is a better teacher of the causes. Also, that among the sciences, the one choiceworthy for the sake of itself, and for the knowing of it, is more theoretical wisdom than one choiceworthy for the sake of its results. Also, that wisdom is more a ruling science than a subordinate one; for a wise person should prescribe, not be prescribed to, and should be obeyed by the less wise, not obey someone else. These, then, are the sort and number of suppositions we hold about theoretical wisdom and theoretically wise people.

Among these, scientific knowledge of all things necessarily belongs to the person who most of all has universal scientific knowledge; for he in a way knows all the things that fall under it. The most universal things of all, however, are almost the most difficult for human beings to know; for they are furthest from perception. And the most exact of the sciences are those concerned most of all with the primary

5. *NE* 6.3–11.

things; for the sciences that proceed from fewer things (for example, arithmetic) are more exact than those that proceed from an addition (for example, geometry).[6] But then too the one that provides theoretical scientific knowledge of the causes is more teachable; for those people teach who state the causes of each thing. And knowing—that is, knowing scientifically—for its own sake most of all belongs to the science of what is most scientifically knowable of all; for the person who chooses to know scientifically because of itself will most of all choose to have what is most of all scientific knowledge, and this is the science of what is most scientifically knowable of all. And what is most scientifically knowable of all are the primary things and causes; for it is through these, and proceeding from these, that the other things are known, not these because of those that fall under them. But the most fitted for rule of the sciences—that is, the one that is fit for rule rather than being subordinate—is that which knows that for the sake of which each thing is to be done, and this is the good of each of them, and in general, the best good in all of nature.

So, from all that has been said, the name being inquired about applies to the same science [as has all these features]; for this must be the one that gets a theoretical grasp on the primary starting-points and causes, and the good or the for-the-sake-of-which is one of these causes.

That it is not a productive science is clear too from those who first turned to philosophy; for it is because of wondering at things that human beings, both now and at first, began to do philosophy. At the start, they wondered at those of the puzzles that were obvious,[7] then, advancing little by little, they puzzled over greater issues—for example, about the affections of the moon and about issues concerning the sun and stars, and how the universe comes to be. Someone who puzzles or wonders, however, thinks himself ignorant (which is why, indeed, the philosopher is in a way a myth-lover;[8] for myth is composed of wonders). So, if indeed it was because of [a desire] to avoid ignorance that they engaged in philosophy, it is evident that it was because of [a desire] to know that they pursued scientific knowledge, and not for the sake of some sort of utility.

What in fact happened is witness to this; for it was when pretty much all the necessities of life, as well as those related to ease and passing the time, had been supplied that such wisdom began to be sought. So clearly we do not inquire about it because of its having another use, but just as a human being is free, we say, when he is for his own sake and not for someone else, in the same way we say that this is the only free science; for it alone is for its own sake.

That is why, indeed, the possession of this science might be justly regarded as not for human beings; for in many ways the nature of human beings is enslaved, so that, according to Simonides, "a god alone can have this privilege," and it is not fitting

6. *APo*. 87a31–37.
7. Reading τὰ πρόχειρα τῶν ἀπόρων.
8. Reading φιλόμυθος ὁ φιλόσοφος πῶς.

that a human being should not be content to inquire about the science that is in accord with himself.[9] If, then, there is something in what the poets say, and envy is natural to the divine, it would probably occur in this case most of all, and all those **983ª1**
who went too far [in this science] would be unlucky. The divine, however, cannot be envious—but, as the proverb says, "Bards often do speak falsely." Moreover, no science should be regarded as more estimable than this. For the most divine science is also the most estimable. And a science would be most divine in only two ways. For the one that a god most of all would have is a divine science, and so is any science of divine things. And this science alone is divine in both these ways; for the god seems 5
to be among the causes of all things and to be a sort of starting-point, and this is the sort of science that a god alone, or that he most of all, would have. All the sciences are more necessary than this one, then, but none is better. 10

The acquisition of it, however, must in a way leave us in a condition contrary to the one in which we started our search. For everyone, as we said,[10] starts by wondering at something's being the way it is, just as people do at those wondrous automata,[11] when they do not have a theoretical grasp on their cause, or at the turnings of the sun, or at the incommensurability of the diagonal (for it seems a wonder to all those who 15
have not yet gotten a theoretical grasp on the cause that there is something that is not measurable even by the smallest unit). It is the contrary and proverbially the better condition, however, that we must end up in, as also happens in those other cases when people learn [the cause]; for nothing would make a man who knows geometry wonder more than if the diagonal were to turn out to be commensurable. 20

What the nature is of the science being inquired about, then, has been stated, and what the target is that the search and the whole methodical inquiry must hit.

1.3
Earlier Philosophers Recognized the Material Cause

It is evident, then, that we must acquire scientific knowledge of the causes that are starting-points; for we say that we know each thing when we think we know its 25
primary cause. Things, though, are said to be causes in four ways. In one way, we say that the substance or the essence is the cause; for the ultimate thing to which the why leads us is the account, and the why that is primary is the cause and starting-point. In another, it is the matter or the underlying subject. In a third, it is the starting-point from which the movement derives. In a fourth, the cause opposite to this, that is, 30
the for-the-sake-of-which and the good; for this is the end of all coming to be and of all movement.

9. Cf. *NE* 1177^b31–1178^a2.
10. 982^b11–17.
11. *MA* 701^b1–32.

We got an adequate theoretical grasp on these in our studies concerning nature.[12]
983ᵇ1 Nonetheless, let us call also on those prior to us who undertook the investigation of the beings and philosophized about the truth. For it is clear that they too speak of certain starting-points and causes. So reviewing them will be of some assistance to
5 the present methodical inquiry; for either we will discover some other kind of cause or trust all the more in those mentioned just now.

Among those who first philosophized, then, most thought that the starting-points of all things were of the material form only; for that from which all things come, and from which as a first thing they come to be and into which they pass away in the end, the substance that persists throughout as an underlying subject while its affections
10 change—this, they say, is element and this the starting-point of the beings. And because of this they think that nothing either comes to be or is destroyed, since a nature of this sort is always preserved. Just as we do not say that Socrates unconditionally comes to be when he comes to be noble or musical, or that he is destroyed when he
15 loses these states, because the underlying subject—Socrates himself—persists, so too they do not say that anything does so in the other cases; for there is always[13] some nature, whether one or more than one, from which the other things come to be while it is preserved.

Yet about the number and form of this sort of starting-point they do not all say the
20 same thing. Thales, the one who started this sort of philosophy, says it is water (because of this, he also declared that the earth rests on water), perhaps reaching this supposition from seeing that the nourishment for all things is wet, that the hot itself comes to be from this, and what is alive lives by this[14] (and what they come to be
25 from is starting-point for all). Because of this, then, he reached this supposition, and because the seeds of all things have a wet nature, and water is the starting-point of the nature for wet things.

Some people[15] suppose that even the ancients who lived long before the present generation, and who first theologized, thought similar things about nature; for they
30 made Ocean and Tethys the parents of coming to be, and made the gods swear their oath by the water they called "Styx"; for what is oldest is what is most estimable, and what is most estimable is what one swears an oath by. It is perhaps unclear whether
984ᵃ1 this belief about nature is in any way ancient or even old, but Thales, at any rate, is said to have declared this about the primary cause (for no one would consider Hippo worthy of inclusion with these, because of the shabbiness of his thought).

5 Anaximenes and Diogenes posit air as prior to water and as more than anything else the starting-point of the simple bodies. Hippasus of Metapontium posits fire, as does Heraclitus of Ephesus. Empedocles, however, posits four things, positing earth

12. *Ph.* 2.3, 2.7.
13. Reading ἀεὶ.
14. Reading καὶ τὸ ζῷον τούτῳ ζῶν.
15. Homer, *Iliad* 14.201, 246 (parents), 15.38 (oath).

along with those already mentioned as a fourth (for these, he says,[16] always persist and do not come to be, except in quantity or smallness, aggregating into one and disaggregating from one).

Anaxagoras of Clazomenae, who was prior to Empedocles in age but in works later, says that the starting-points are unlimited; for he says that pretty much all the uniform things (like water and fire) come to be and are destroyed in this way, through aggregation and disaggregation alone. Otherwise, they neither come to be nor are destroyed, but persist and are eternal.

On the basis of this, then, one might think that the only cause is the so-called material form. But as people progressed in this way, the facts themselves showed them the way and compelled them to inquire further; for however much all coming to be and passing away may be from some one thing (or even from more than one thing), why does this happen? That is, what is the cause? For the underlying subject itself does not make itself change, at any rate. I mean, for example, that neither the wood nor the bronze is a cause of either of them changing, nor does the wood make a bed or the bronze a statue, but something else is the cause of the change, and to look for this is to look for another starting-point—the starting-point from which the movement derives, as we would say.

Those, then, who altogether at the start latched onto this methodical inquiry, and said that the underlying subject was one, had no misgivings about this. But some of those who said that it was one, as if defeated by this inquiry, said that the one, that is, nature as a whole, is immovable—not only as regards coming to be and passing away (for this is an ancient view agreed to by all), but also as regards every other sort of change, and this view is special to them. Among those who said that the universe is one, then, none managed to discover a cause of this sort, except perhaps Parmenides, insofar as he posited causes not only as one but also somehow as two.[17] Therefore, for those who make a plurality [of underlying subjects] it is more possible to state [what this sort of cause is]—for example, for those [who posit] hot and cold or fire and earth; for they treat fire as having a nature that initiates movement, and treat water, earth, and things of this sort in the contrary way.

After these thinkers and these sorts of starting-points, which were found inadequate to generate the nature of the beings, people were again compelled by the truth itself, as we said,[18] to look for the next sort of starting-point. For that the good or noble[19] state of some of the beings—or the coming to be in that state of other ones—should have fire or earth or anything else of this sort as its cause is presumably not probable, nor is it probable that these people should have thought so. But to turn over so important a fact to chance or luck could not be correct either. When one person said, then, that understanding was present (just as in living things) in nature too,

18. $984^{a}18–19$.
19. $1078^{a}31–32$.

as the cause of the cosmos and of all, he seemed like a sober person by contrast with his improbability-uttering predecessors. We know that Anaxagoras explicitly adopted these accounts, but Hermotimus of Clazomenae is "charged" with speaking that way earlier. Those who supposed this, then, thus posited the cause of their noble state as a starting-point of the beings, and at the same time that this is the sort of cause from which the movement starts for them.

1.4
The Discovery of the Efficient Cause

One might suspect that Hesiod was the first to look for this sort of thing, or someone else who posited love or appetite among the beings as a starting-point, as, for example, Parmenides also did; for he too, in describing the coming to be of the universe, says that "first of all the gods she devised Love."[20] And Hesiod says,

> Of all things the very first that came to be was Chaos, and then
> Broad-breasted Earth,
> And Love, preeminent among all the immortals,[21]

on the supposition that there must be some cause among the beings to move and draw things together. (As for the way these people should be arranged with regard to priority, then, let us leave it till later to judge.[22])

But since it was evident that the contraries of good things were also present in nature (not only order and nobility but also disorder and baseness, and more bad things than good, and more base things than noble ones), someone else accordingly introduced love *and* strife as each singly the cause of one of the two sorts of things. For if one were to follow and grasp the thought of Empedocles,[23] and not the inarticulate words, one would find that love is the cause of good things and strife of bad ones. So, if one were to claim that Empedocles in a way says, and was the first to say, that the good and the bad are starting-points, one would perhaps be right—if indeed the cause of all good things is the good itself.

These people, then, as we say, manifestly latched onto two of the causes we distinguished in our studies concerning nature,[24] the matter and the starting-point of movement. But they did so indistinctly and in a not at all perspicuous way, like untrained people in fights; for these too, as they circle their opponents, often strike good blows, but they do not do so in virtue of scientific knowledge, just as the others

24. *Ph*. 2.3, 2.7.

do not seem to know what they are saying; for they apparently make pretty much no use of these causes, except to a small extent.

For Anaxagoras uses understanding as a mechanism for cosmic production; for when[25] he is puzzled about what the cause is due to which something holds of necessity, he drags understanding in, but in other cases he makes anything rather than understanding the cause of things that come to be.

As for Empedocles, although he uses these causes to a greater extent than Anaxagoras, he neither uses them adequately nor finds any consistency in them. At any rate, love often disaggregates things for him, while strife aggregates them. For whenever the universe is divided up into its elements because of strife, the fire is aggregated into one, and so is each of the other elements, and whenever things come together into one again under the influence of love, it is necessary that the parts from each get disaggregated again.

Empedocles, then, going beyond his predecessors, was the first to introduce the dividing of this cause, not making the starting-point of the movement one thing, but distinct and contrary ones. Further, he was the first to say that the forms of matter, the so-called elements, were four. Yet he does not use four but treats them as two only, fire by itself, on the one hand, and its opposites—earth, air, and water—taken as one nature, on the other, as one may grasp from studying his verses. He, then, as we say, spoke about the starting-points in this way and as being this many.

Leucippus, however, and his associate Democritus say that the full and the void are the elements, calling the former "being" and the latter "not being" and, of these, the full or the solid is being, while the void is not being (that is why they also say that being no more *is* than not being, because body no more *is* than void[26]), and that these, as matter, are the causes of the beings. And just as those who make the underlying substance one generate the other things by means of its affections, positing the rare and the dense as starting-points of these affections, so, in the same way, these people too say that the differences are the causes of the other things. And these differences, they say, are three—shape, order, and position; for they say that being is differentiated by rhythm, contact, and turning alone. And of these rhythm is shape, contact is order, and turning is position; for A differs from N in shape, AN from NA in order, and Z from N in position. But the question of movement—where it comes from and in what way it belongs to the beings—these people, much the same as the others, carelessly neglected.

Concerning the two causes, then, as we say, this seems to be as far as the earlier philosophers went in their inquiry.

1.5
Pythagoreans and Eleatics: Intimations of the Formal Cause

Among these thinkers and before them, those called "Pythagoreans"[27] were the first to latch onto mathematics. They both advanced these inquiries and, having been brought up in mathematics, thought that its starting-points were the starting-points of all the beings. Since among these starting-points the numbers are by nature primary, and since they seemed to observe many similarities to the beings in the numbers, and to things that come to be, more so than in fire, earth, or water (for example, that such-and-such an affection of numbers is justice, that such-and-such an affection is soul and understanding, another one is opportune time, and—one might almost say—each of the rest likewise), and further, seeing in harmonies, affections, and ratios that are found in numbers—since, then, the other things seemed to have been made like numbers in the whole of their nature, and numbers were primary in the whole of **986ᵃ1** nature, they took the elements of numbers to be the elements of all the beings, and the whole heaven to be harmony and number.

And whenever they found consistencies and harmonies in the numbers with the affections and parts of the heaven and with the whole arrangement of the cosmos, they collected these together and fitted them into their scheme. And if there was something missing, they added it eagerly, in order to make their system a connected whole. I mean, for example, that since the number ten seems to be complete and to encompass the whole nature of the numbers, they say that the bodies that move through the heaven are ten, but because those that are visible are only nine they make anti-earth the tenth.

We have discussed these issues more exactly elsewhere.[28] But we are going over them again in order that we may grasp on the part of these thinkers too the starting-points they posit, and in what way these fall under the causes mentioned. It is evident, then, that they too consider that number is a starting-point for the beings both as matter and as affections and states, that the elements of number are the odd and the even, and that of these the odd is limited and the even unlimited. They consider that the one comes from both of these (for it is both odd and even), that number comes from the one, and that the whole of the heaven (as was said) is numbers.

Others among these same thinkers say that there are ten starting-points arranged in two columns:

limited	unlimited
odd	even
one	plurality
right	left

27. F176–191.
28. *Cael.* 2.13.

male	female
resting	moving
straight	curved
light	darkness
good	bad
square	rectangular

This is precisely how Alcmaeon of Croton also seems to have supposed things were, and either he got this account from them or they got it from him; for Alcmaeon too made claims much the same as theirs; for he says that most things relating to human beings come in twos, mentioning not definite contraries, as these thinkers did, but random ones—for example, white and black, sweet and bitter, good and bad, great and small. In this way, then, he threw out indefinite suggestions about the rest, while the Pythagoreans made claims both about how many contraries there are and what they are. **986^{b}1**

From both of these, then, we can grasp this much, that the contraries are the starting-points of the beings, and from the first how many and what they are. Yet in what way these can be brought together and related to the causes mentioned has not been articulated by them in a perspicuous way. They seem, however, to range the elements among the material forms; for it is from these as components that they say the substance of things is composed and molded.

As for the ancients, then, and those who spoke of the elements as plural, we can get an adequate theoretical grasp on their thought from these considerations. There are some, however, who made claims about the universe as being of a singular nature—although not all of them did so in an equally correct way or in a way equally in accord with the facts of nature.[29] An account of these thinkers, then, is in no way appropriate to our present investigation of causes. For they do not, like some of the natural scientists, suppose that being is one, yet generate it from the one as from matter, but speak in another way; for while the former are positing movement in addition (making the universe come to be), the latter say that it is immovable.

However, this much at least does properly belong to the present investigation: Parmenides seems to latch onto what is one in accord with the account, Melissus onto what is one in accord with the matter (which is why Parmenides says that it is limited, Melissus that it is unlimited). Xenophanes, by contrast, who was the first of these monists (Parmenides is said to have been his student), said nothing perspicuous, nor does he seem to have touched upon the nature of either of these causes, but with a view to the heaven as a whole he says that the one is the god. These thinkers, then, as we said, must be set aside for the purposes of the present investigation—two of them altogether, as being a little boorish, Xenophanes and Melissus. Parmenides, however, seems perhaps to speak with more insight; for claiming that beyond being there is no such thing as not

29. Reading τὴν φύσιν.

being, he thinks that being is necessarily one and that nothing else exists (about this we have spoken more perspicuously in our studies concerning nature[30]). But finding himself compelled to follow the things that appear to be so, he supposes that there is one thing according to reason but more than one according to perception, and now posits two causes and two starting-points, hot and cold—in other words, fire and earth. And of these he ranges the first with being and the second with not being.

From what has been said, then, and from the account of the wise men who have now sat in council with us, we have gotten this much: From the first thinkers we got that the starting-point is corporeal (for water and fire and things of this sort are bodies), some positing one corporeal starting-point, others more than one, but both positing them in the form of matter. From some, who posit both this cause and besides it the cause from which the movement derives, which we got as one thing from some, and from others as two things. Up to the Italians,[31] then, and apart from them, the rest spoke about these things as being more of one kind,[32] except that, as we said,[33] they have in fact made use of two causes, and some made the second of them (the one from which the movement derives) one, others two.

The Pythagoreans have spoken of the starting-points as two in the same way, but added this much, which is in fact special to them. They thought that the limited and the unlimited were not certain distinct natures, such as fire or earth or anything else of this sort, but that the unlimited itself and the one itself were the substance of the things of which they were predicated, and that is why number was the substance of all things. On these issues, then, they made claims this way, and so about the what-it-is they also started to speak and to give definitions, even if they treated the issue too simply. For they defined superficially and also the first subject to which a given definition applied, this they believed to be the substance of the thing—as if someone were to think that double and two were the same, because in the first instance double belongs to two. But being double and being two are presumably not the same. Otherwise, the one will be many—a consequence that they in fact drew.

From the earlier thinkers, then, one can get this much.

1.6
Material and Formal Causes in Plato

After the philosophies mentioned came the system of Plato. In most respects it followed these thinkers but also had special features that distinguished it from the philosophy of the Italians. For having been from his youth familiar first with Cratylus[34]

30. *Ph.* 1.3.
31. I.e., the Pythagoreans.
32. Reading μοναχώτερον. Cf. μοναχῶς at 995ᵇ15.
33. 985ᵃ30–31.
34. Also, 1010ᵃ7–15.

and the Heraclitean beliefs that all perceptibles are always flowing, and that there is no scientific knowledge concerning them, these views he also held later. The study Socrates made, though, was concerned with ethical issues, not at all with nature as **987b1**
a whole. In these, however, he was inquiring about what is universal and was the first to fix his thought on definitions. Plato, accepting him [as a teacher], took it that this fixing is done concerning other things and not the perceptible ones; for 5
it is impossible for there to be a common definition of any perceptibles, as they, at any rate, are always changing. He, then, called the beings of this other sort "Forms," and the perceptible ones are beyond these and are all called after these; for the many synonymous [perceptible] things that are homonymous with the Forms[35] are [what they are] through participation in them.

As for participation he changed only the name; for the Pythagoreans say that the 10
beings are [what they are] by "imitating" the numbers, while Plato says that they are [what they are] by "participation," changing the name. What this participation or this imitation of the Forms could be, however, they left an open question.

Further, apart from both the perceptibles and the Forms are the objects of mathematics, he says, which are intermediate between them,[36] differing from the percepti- 15
ble ones in being eternal and immovable, and from the Forms in that there are many similar ones, while the Form itself in each case is one only. And since the Forms are causes of the other things, he thought that their elements were the elements of all the beings. It is as matter, then, that the great and the small were starting-points, and 20
as substance, the one;[37] for generated [as they are] from the great and the small by participating in the one, the Forms are the numbers.[38]

In saying that the one is substance, and is not by being another thing said to be one,[39] he spoke in much the same way as the Pythagoreans, and in saying that the numbers are the causes of the substance of other things he agreed with them. But instead of making the unlimited one thing, making it a dyad from the great and the 25
small is special to him. Further, in his view too the numbers are beyond the perceptibles, while they say that the things themselves are numbers, and do not place the objects of mathematics [as intermediates] between them.

The fact, then, that he made the one and the numbers be beyond the things, not treating them as the Pythagoreans did, and that he introduced the Forms, were due 30
to his investigation of accounts (for the previous thinkers had no share of dialectic), and the fact that he made the other nature a dyad was because he thought that the numbers, except those that are prime, are naturally well-disposed to being generated

35. Reading τὰ πολλὰ τῶν συνωνύμων ὁμώνυμα τοῖς εἴδεσιν.
36. Objects of mathematics as intermediate things, lying between Forms and perceptibles, are referred to at $987^{b}29$, $991^{b}29$, $992^{b}16$, $995^{b}17$, $997^{b}2$, $998^{a}7$, $1002^{b}13$, 21, $1059^{b}6$, $1069^{a}4$, $1077^{a}11$, $1090^{b}35$.

39. *APo*. $83^{a}9$–14.

from this as from some plastic material. And yet what happens is the contrary; for
988^{a}1 it is not reasonable that it should happen in the way Plato describes. For as things stand[40] they make many things from the matter, while the Form generates only once, but what is evident is that from one matter comes one table, while the person who imposes the Form, though he is one, makes many. And the relation of male to female
5 is similar; for the female is impregnated by one copulation, but the male impregnates many. And yet these are [merely] imitations of those starting-points.

As regards the things being inquired about, then, Plato described them this way. It is evident, however, from what has been said, that he made use of only two causes, that of the what-it-is and that of the matter[41] (for the Forms are the causes of the
10 what-it-is of other things, as the one is of the Forms), and that a certain[42] [cause] is the underlying matter, of which the Forms are said in the case of the perceptibles, and that, in the case of the Forms, the one is a dyad, namely, the great and the small. Further, he has assigned the cause of good and bad to both elements, one to each,[43] which we
15 say some of the previous philosophers also looked to do—for example, Empedocles and Anaxagoras.

1.7
Prior Thinkers and the Four Causes

We have, then, briefly and in headline fashion, gone through which thinkers have spoken and in what ways about the starting-points and about the truth. Nonetheless,
20 we have gotten this much at least from them, that of those who have spoken about a starting-point and a cause none has mentioned any outside of those we distinguished in our studies concerning nature;[44] rather, it is evident that they are all in some indistinct way touching upon these. For some speak of the starting-point as matter, whether they posit one or many, and whether they make it a body or something
25 incorporeal—for example, Plato speaks of the great and the small, and the Italians of the unlimited, Empedocles of fire, earth, water, and air, Anaxagoras of the unlimited number of uniform things. All these thinkers, then, latched onto this sort of cause,

40. Reading νῦν μὲν γὰρ.
41. A puzzling claim (repeated at 988^{a}33–34), since in addition to material and formal causes Plato also seems to recognize efficient causes, such as the divine craftsman or demiurge (*Sophist* 265b–e, *Timaeus* 28c–29a), the soul (*Phaedrus* 245c–d, *Laws* 891c–899d), and the cause of the mixture of the limited and unlimited (*Philebus* 23d, 26e–27c), and final causes, such as the good aimed at by the divine craftsman or other such cosmic makers (*Philebus* 20d, 53e, *Timaeus* 29d–30c, *Laws* 903c). Reasons to think that the Form of the good is not a satisfactory final cause are given at *NE* $1096^{b}31$–$1097^{a}8$.
42. Reading τὶς.
43. I.e., he made the one the cause of good and the great and the small (matter, the unlimited) the cause of bad.
44. *Ph.* 2.3, 2.7.

and so too did those who spoke of air, fire, water, or something denser than fire and more fine-grained than air; for in fact some have said[45] that the primary element is like this. These thinkers, then, latched onto this cause alone, and certain others onto the starting-point from which movement derives—for example, those who made love and strife or understanding and love a starting-point.

But the essence and the substance no one has presented in a perspicuous way, although those who posit the Forms speak of it the most; for they neither suppose the Forms to be matter for the perceptibles, and the one as matter for the Forms, nor these as the starting-point from which movement comes about—for they say that these are rather causes of immobility and of being at rest; instead, the Forms provide the essence for each of the other things, and the one provides it for the Forms.

And that for the sake of which actions, changes, and movements take place they speak of as in a way a cause, but not in this way—that is, not in the way in which it is its nature to be a cause. For those who speak of understanding or love posit these causes as good, but they do not speak as if anything is or comes to be for the sake of these things, but as if movements arise from them. In the same way too those who say that the one or being is such a nature say that it is a cause of substance, but not that anything is or comes to be for its sake, so that in a way they do and in a way they do not say that the good is a cause; for they do not say it is so unconditionally but coincidentally.

That we have correctly distinguished the causes, then, both how many they are and what they are, all these thinkers also seem to testify (since they have been unable to touch upon any other cause), and, in addition, it is clear that the starting-points must be looked for in all these ways or in some of them. But as for how each of these people has spoken and how he stands concerning the starting-points, let us next, as far as is possible, go through the puzzles about these.

1.8
Criticism of Pre-Platonic Philosophers

Those thinkers, then, who posit that the universe is one and who also posit a single nature as matter, and this corporeal and having magnitude, clearly err in many ways. For they posit the elements of bodies alone, but not of the incorporeal things, although incorporeal ones are also beings.[46] And when they try to state the causes of coming to be and passing away and to give a natural scientific account of all things, they do away with the cause of movement. Further, they err by not positing the substance (that is, the what-it-is) as a cause of anything, and, in addition, by too readily speaking of any of the simple bodies except earth as starting-point, without

45. It is unclear who held this view, also mentioned at *Ph.* $187^{a}14$, *GC* $328^{b}35$, $332^{a}21$.
46. Reading ὄντων καὶ ἀσωμάτων.

investigating the way these things come to be from each other—I mean, fire, water, earth, and air. For some come to be from each other by aggregation and others by disaggregation, and with respect to priority and posteriority this makes a great difference. For in one way the most elemental thing of all would seem to be the primary one from which they come to be by aggregation, and this would be the most fine-grained of the bodies and having the smallest parts.

That is why those who posit fire as starting-point would most of all be speaking in agreement with this account. But each of the others also agrees that the element of the bodies is a thing of this sort. At any rate, none of those who say that it is one thought that earth is the element, clearly because of the largeness of its parts, while of the three [other] elements each has found some judge in its favor, for some say that this is fire, others that it is water, others that it is air. And yet why do they not also say earth, as ordinary people do? For these say that all things are earth, and Hesiod[47] too says that earth was the first of the bodies to come to be (thus it turns out that the supposition is ancient as well as popular). According to this account, then, if someone said it is one of these things, except for fire, or posited that it is denser than air but more fine-grained than water, he would not be speaking correctly. But if what is posterior in coming to be is prior in nature, and what is concocted and aggregated is posterior in coming to be, the result would be the contrary of this, water being prior to air and earth to water.

About those, then, who posit one cause of the sort we described, let so much be said. But the same would apply if someone posits that these are more than one, in the way that Empedocles says that the matter is four bodies. For he too necessarily incurs consequences, some of which are the same as before, while others are special to him. For we see these bodies coming to be from one another in such a way that the same body does not always remain fire or earth (these have been spoken about in our studies concerning nature[48]). Also, about the cause of movement, whether one or two must be assumed, he must be thought to have spoken neither correctly nor altogether reasonably. Generally too, those who speak this way necessarily do away with alteration; for cold will not come from hot or hot from cold. For if it did, there would be something that received these very contraries, and there would be some one nature that became fire and water, which this thinker does not say.

If one supposed Anaxagoras to say that there are two elements,[49] what one supposed him to say would be most in accord with an account that he himself did not articulate, although he would necessarily have had to follow those who do advance it. For to say that at the start all things had been mixed is both strange on other grounds and because it follows that they must have been unmixed before the start, and because a random thing cannot naturally be mixed with a random thing, and in

47. *Theogony* 116 (984^b28).
48. *Cael.* 3.7, *GC* 2.1–5.
49. I.e., the understanding and the primordial mixture, containing an unlimited number of uniform things (985^a18–19, 988^a28).

addition because affections—even [intrinsic] coincidents—would be separated from substances (for of the same things as there is mixture there is also separation).

Nonetheless, if someone were to follow along with him while at the same time helping to articulate distinctly what he wishes to say, he would presumably appear to be speaking in a more advanced way. For when nothing was yet separated out, clearly nothing could be truly said of the substance that was there. I mean, for example, that it was neither white nor black nor gray nor any other color, but of necessity colorless; for otherwise it would have had one of these colors. And similarly it was flavorless, by this same argument, and had not a single one of the similar affections; for it could have neither some quality nor some quantity nor some what. For otherwise one of the particular forms would have belonged to it, and this is impossible, because all were mixed together; for it would have already been separated out (and he says that all things were mixed except understanding, which was alone unmixed and pure). From this, then, it follows that he must say that the starting-points are the one (for this is simple and unmixed) and the other, which is such as we posited the indefinite[50] to be, before it is given definition and participates in some Form. So, while he speaks neither correctly nor perspicuously, he means much the same as later thinkers were saying and now[51] appears more and more to be the case.

But in fact these thinkers are at home only in accounts concerning coming to be, passing away, and movement; for it is pretty much only of this sort of substance that they look for the starting-points and causes. Those, however, who produce their theoretical investigation about all the beings, positing that some of the beings are perceptible, others imperceptible, are clearly conducting an investigation of both kinds. That is why one should devote more time to seeing what they say correctly and what incorrectly in the investigation of the issues now before us.

Those called "Pythagoreans," then, use their starting-points and elements in a stranger way than the natural scientists. That is because they did not get these from perceptibles; for the mathematical beings are without movement, except for those with which astronomy is concerned. Yet all their discussions and the issues they busied themselves with were concerned with nature; for they generate the heaven, and, as regards its parts, affections, and works, they closely observe the things that happen, and they use up their starting-points and their causes on these, as if agreeing with the various natural scientists that being is just this, what is perceptible and is embraced by the so-called heaven. But the causes and starting-points they mention are, as we said,[52] adequate to go up even to the higher beings, and are more fitted to these than to accounts concerned with nature. About what way there can be movement, however, if limited and unlimited and odd and even are the only things assumed, they have nothing to say, or about how it is possible without movement and change for

50. I.e., the "indefinite dyad" (e.g., 1081^{a}14, 22).
51. Reading νῦν.
52. 989^{b}31.

there to be coming to be and passing away or the works of the bodies that are moved throughout the heaven.

Further, if either one granted them that spatial magnitude consists of these elements or that this were proved, still in what way would some bodies be light and others have weight? For, based on what they assume and say, they are speaking no more about mathematical bodies than about perceptible ones. And the reason why they have said nothing whatever about fire, earth, or the other bodies of this sort is precisely, I think, because they have nothing special to say about perceptible bodies.

Further, how should one suppose the affections of number and number itself to be causes of the things that are and that come to be in the heaven both at the start and now, when there is no other number besides this number for the cosmos to be composed of? For when they say that belief and appropriate time are found in such-and-such a part of the cosmos, and injustice and disaggregation or mixture a little above or below, and say that a demonstration of this is that each of these is a number, but there happens to already be a plurality of composed magnitudes in the relevant place, because these affections follow along with the corresponding places, is this the same [sort of] number, the one in the heaven, that one should suppose each of these things to be, or is it another [sort] than this? For Plato says it is another. And yet he too thinks that both these things and their causes are numbers, but that the intelligible numbers are causes, while the other ones[53] are perceptible.

1.9
Criticism of the Theory of Forms

Let us leave the Pythagoreans for now; for it is enough that we have latched onto them to this extent. As for those who posited the Forms, first, in looking to find
990b1 the causes of the beings that exist here, they introduced others, equal in number to these—as if a person who wished to count the beings were to think that he would not be able to do it while there were so few of them, and so tried to count them by making more; for the Forms are pretty much equal in number to—or no fewer than—the things whose causes they were inquiring about, in proceeding from them to the Forms; for in each case there is something that has the same name, both among the other things of which there is a one over many and beyond the substances, both over the things that exist here and over the eternal things.[54]

Further, of the ways in which we prove[55] that there are Forms none makes these evident; for from some of these ways no deduction is necessarily generated, while from some others Forms are also generated of things of which we think there are no Forms. For, according to the arguments from the sciences, there will be Forms of all

53. E.g., "two armies or two herds of cattle" (Plato, *Philebus* 56d).
54. 990b2–991b8 = 1078b34–1079b3.
55. Aristotle is speaking as if in reference to his own beliefs.

things of which there are sciences, and according to the one over many there will be Forms even of negations, while according to the argument that there is thinking of a thing that has passed away, there will be Forms of things that pass away; for there is an appearance of them.[56]

Further, of the more exact of the arguments, some produce Forms of relatives, of which we say there is not an intrinsic kind, while others imply the third man.

And, in general, the arguments for the Forms do away with the things whose existence we, as people who speak of Forms, wish for more than the existence of the Forms; for in fact it follows that it is not the dyad that is primary but number, that the relative is prior to the intrinsic, and all the other things that certain people, by following out the beliefs held about the Forms, have accepted contrary to the starting-points.

Further, by the supposition according to which we say that there are Forms, there will be Forms not only of substances but also of many other things (for in fact the intelligible object is a one not only in the case of substances, but also in the case of the other things, and there are sciences not only of substance but also of the other things, and countless other such difficulties arise). But in accord with the necessities of the case and with the beliefs held about them, if the Forms are to be participated in, there must be Forms of substances only, for they are not participated in coincidentally, but rather a thing must participate in each in this way, insofar as it is not said of an underlying subject (I mean, for example, if something participates in double-itself, it also participates in the eternal, but does so coincidentally; for it is coincidental to the double that it is eternal), so that the Forms will be substance. But it is the same things that signify substance here as over there—or what will it mean to say that there is something beyond these things here, the one over the many? And if the Forms and what participates in them are the same in form, there will be something common to these; for why should the two be one and the same in the case of the twos that pass away and in those that are many but eternal rather than in the case of [two-] itself and some particular [two]? But if they are not the same in form, they would be homonymous, just as if someone were to call Callias and a wooden statue a "man," seeing nothing in common between them.

Above all, one might go through the puzzles about what precisely the Forms contribute to perceptibles, either to those that are eternal[57] or to those that come to be and pass away; for they are not the cause of movement or of any change whatever in them. But then they are also no help at all either as regards the scientific knowledge of the other things; for they are neither their substance (otherwise they would be in them) nor in relation to their being, if they are not components of the things that participate in them; for if they were, they might perhaps seem to be causes in the way that what is white is a cause when mixed with a white thing. But this account is

56. For the arguments, see F174.
57. E.g., the heavenly bodies.

all too readily upset—it is one that first Anaxagoras[58] and later Eudoxus and certain others stated; for it is easy to collect many impossibilities against a belief of this sort.[59]

But then neither is it possible to say, in any of the familiar ways of speaking, that the other things come from the Forms. To say that they are paradigms and that the other things participate in them is to utter empty words and poetic metaphors. For what is it that works by looking to the Forms?[60] It is possible for anything both to be like and become like another thing without being copied from it, so that whether Socrates exists or not, someone could become like him. And the same would clearly hold even if Socrates were eternal. Also, there will be more than one paradigm for the same thing, and so more than one Form—for example, the Forms of man will be animal and two-footed, as at the same time will be man-itself.[61] Further, the Forms will be paradigms not only of the perceptibles but also of themselves—for example, the kind, as kind consisting of several forms. So the same thing will be paradigm and copy.

Further, it would seem to be impossible for the substance and that of which it is the substance to be separate. So how could the Forms, if they are substances of things, be separate from them?

In the *Phaedo*,[62] however, it is said as follows: the Forms are causes both of the being and of the coming to be of things. And yet if the Forms do exist, the things that participate in them would still not come to be unless there was a mover. Also, many other things come to be—for example, a house or a ring—of which we say there are no Forms. So it is clear that it is also possible for the others to be and to come to be through the same causes as the things mentioned just now.

Further, if indeed the Forms are numbers, in what way will they be causes? Is it because the beings are other numbers—for example, this number here man, this one here Socrates, and this one here Callias? If so, why are the one lot of numbers causes of the other lot? For even if one lot are eternal and the other not, it will make no difference. But if the things that exist here are ratios of numbers (for example, a musical concord), it is clear that there is at least one thing of which they are the ratios. If, then, this thing—the matter—is something definite, it is evident that the numbers themselves will also be some ratios of something to something else. I mean, for example, that if Callias is a ratio, expressible in numbers, of fire, earth, water, and air, it is also of certain other underlying things that his Form too will be a number. And man-itself, whether it is some sort of number or not, will nonetheless be a ratio, expressible in numbers, of certain things and not a number, and nor, because of this [argument], will any Form be a number.

---

58. Anaxagoras' seeds are characterized as "unmixed before the start" (989a34–b1), and so are relevantly like separate Platonic Forms.
59. F174, 97.28–98.24.

61. I.e., the Form of a man.
62. 100d, 101c.

Further, one number may come to be from many numbers, but how can one Form come from many Forms? And if it does not come from them themselves but from the things that are in a number (for example, in the myriad), how will it be with the units? For if they are of the same Form, many strange things follow, as they also do if they are not of the same Form (whether the one lot as each other or all the lots as all the others[63]); for in which way will they differ, since they are without affections? For these results are neither reasonable nor consistent with our understanding [of units].

Further, they will have to introduce some other kind[64] of number (with which arithmetic is concerned), as well as all the things called "intermediates" by some thinkers. And how are these to exist and from what starting-points? Or why will they be intermediate between the things here and the things themselves?

Further, each of the units in the two comes from some prior two; and yet this is impossible.[65]

Further, why is number, when taken all together, one?[66]

Further, in addition to what has been said, if indeed the units are different,[67] Platonists should have spoken like those who say that the elements are four, or two (for each of those says not that what is common—for example, body—is an element, but rather fire and earth, whether [they think] there is something common to them—body—or not), but in fact they speak as if the one were uniform like fire or water. If this is so, however, the numbers will not be substances;[68] rather, it is clear that—if indeed there is some one-itself and it is a starting-point—things are said to be one in various ways.[69] That would be impossible otherwise.

When we wish to refer back substances to their starting-points, however, we posit that lines come from the short and the long (that is, from a certain sort of small and great), plane from broad and narrow, and solid from deep and shallow, and yet how, then, will either a surface have a line or a solid have a line and a surface? For the broad and narrow is a kind distinct from deep and shallow. So, just as number is not present in these, because the many and few are distinct from them, it is clear that none of the higher ones will be present in the lower ones. But then again broad is not a kind of deep either; for then a body would be a certain sort of plane.

Further, as for the points, from what will their presence in lines come? In fact, Plato used even to contest this kind as being a geometrical dogma. Instead, he called it "the starting-point of line," and often posited that it consisted of indivisible lines. And yet these lines must have some limit, so that from the argument on the basis of which a line exists, a point also exists.

66. 1082^{a}15–26.
67. 1084^{b}13–32.
68. 1081^{a}5–17.
69. 1053^{b}9–1054^{a}19.

In general, though wisdom inquires about the cause of perceptible things, we left this alone (for we say nothing about the cause from which change starts), and—thinking that we are stating the substance of these things—we say that they are yet other substances, but as for the way in which these are substances of those, we state it through empty words. For "participation," as we said previously,[70] means nothing.

As, then, for precisely the thing we see[71] to be the cause for the sciences, that because of which every understanding and every nature does things, the Forms in no way latch onto this cause either, which we say is one of the starting-points; instead, mathematics has become philosophy for the present thinkers, although they say that one should busy oneself with it for the sake of something else.

992[b]1 Further, the substance that is the underlying subject as matter one might suppose to be too mathematical, and to be more a predicate and a difference in the substance and of the matter than matter proper[72]—for example, the great and the small are like the rare and the dense that the natural scientists also speak about, calling these the "primary differences" of the underlying subject; for these are a sort of excess and deficiency.

And as for movement, if these things constitute movement, it is clear that the Forms will move. But if not, where does movement come from? In fact, the whole investigation concerning nature has been done away with.

And what seems to be easy, to prove that all things are one, does not come about; for by setting-out it does not come about that all things are one, but—if one grants all [their assumptions]—that there is some *one*-itself, and not even that, if one does not grant that the universal is a kind, which in some cases is impossible.

And there is no account of the lengths, surfaces, and volumes that come after the numbers, either of the way they are or will be or of what capacity they have; for these things cannot be Forms (for they are not numbers), or intermediates (for those are the objects of mathematics), or things that pass away, but appear to constitute another, fourth kind.

In general, to look for the elements of the beings without making distinctions, when they are said [to *be*] in many ways,[73] makes it impossible to find them, and especially if one looks in this way[74] for the sorts of elements they come from. For from what elements will doing or undergoing or straightness come? Surely, it is not possible to get hold of them, but if indeed it is possible, it is only for the elements of substances. So either to look for the elements of all the beings or to think that one has found them is incorrect.

And how could one even learn the elements of all things? For clearly one cannot start by already knowing something that is prior to them. For just as a person who

70. 991[a]20–22.
71. We Aristotelians, as at 992[a]29, not we Platonists as at 992[a]27.
72. 1088[a]15–21.
73. 1003[a]33, 5.7, 1026[a]33–[b]4, 1028[a]10–31, 1051[a]34–[b]6.
74. I.e., by setting-out.

is leaning geometry, though he may have prior knowledge of other things, has no prior knowledge of the things of which geometry is the science and about which he is trying to learn, so it is too, then, in the case of the other sciences, so that if there is a science of all things, of the sort some people say there is, a person who is to learn it should start by knowing nothing whatever. And yet all learning takes place through things of which there is prior knowledge, either of all of them or of some of them, that is, either through demonstrations or definitions (for one must have prior knowledge of the things from which the definition comes and they must be well-known), and similarly too in the case of learning through induction. But then again if such knowledge were in fact innate,[75] we might wonder how we could possess the most excellent of the sciences[76] without being aware of it. **993ª1**

Further, how could one come to know the things from which such knowledge comes, and how is this to be made clear? There is a puzzle about this too; for there might be a dispute about it, just as there is about certain voiced syllables; for some people say that ZA comes from S, D, and A, while others say that it is another sound, and not any of the well-known ones.[77]

Further, as for the things of which there is perception, how could one come to know them without having the relevant perception? And yet he would have to, if in fact these are the elements from which all things come, just as complex sounds come from the elements that properly belong to them.

1.10
Earlier Philosophy Reveals No Causes beyond the Four

That all thinkers seem to have been inquiring about the causes that were mentioned in the *Physics*, then, and that we cannot mention any outside these, is clear even from what was said previously. But [they touched upon] these indistinctly, and so in a way they have all been discussed before, and in a way they have not been discussed at all. For early philosophy seemed to speak inarticulately about all things, because it was young and at the starting-point, since even Empedocles says[78] that bone exists as a result of its ratio, and this is the essence and the substance of the thing. But then it is similarly necessary that flesh and each of the others should be its ratio, or that not one of them should. Therefore, it is because of this that both flesh and bone and everything else will exist, and not because of the matter, which he mentions—fire,

75. Plato, *Meno* 80d–81d.
76. I.e., theoretical wisdom ($982^{a}1$–3, $983^{a}11$).
77. The Greek letter *zeta* has two pronunciations, and so it is associated with two voiced sounds. One group claims that ZA is pronounced like S/DA, the other that it is a unique voiced sound, a phonetic element.
78. B96, B98 DK.

earth, water, and air. But while if someone else had said this, he would necessarily have agreed, he has not said it in a perspicuous way.

As regards such things,[79] then, we have also made our views clear previously.[80] But let us go back again to whatever one might puzzle over concerning these things themselves;[81] for maybe from these we might achieve something of a puzzle-free condition in connection with the later puzzles.

BOOK 2 (LITTLE ALPHA)[82]

2.1
The Primary Causes of the Beings and Our Understanding of Them

A theoretical investigation concerning the truth [of things] is in one way difficult and in another way easy. A sign of this is that while none is capable of touching upon it in a worthwhile way, neither do all completely fail to hit it, but rather each **993b1** has something to say about the nature [of things], and while taken individually they contribute little or nothing to it, a gathering together of all results is a contribution of some magnitude. So if indeed the truth is like the proverbial barn door that none can miss, in this way it would be easy, but the fact that we can have some grasp on the whole while being incapable of grasping the part indicates how difficult it is.[83]

Perhaps too, since difficulties occur in two ways, it is not in the things but in us that the cause of this one lies; for as the eyes of bats are to the light of day, so is the understanding in our souls to the things that are by nature most evident of all.

It is a just thing, however, to be grateful not only to those whose beliefs one shares, but also to those who have expressed more superficial views; for they have also contributed something; for they prepared the state [of the subject] for us; for if in fact there had been no Timotheus, there would be much lyric poetry that we would not possess, but if there had been no Phrynis, there would have been no Timotheus. It is the same way too with those who have expressed views about the truth [of things]; for from some thinkers we have received certain beliefs, while others caused these thinkers to become what they were.

It is correct too for philosophy to be called "scientific knowledge of the truth." For of theoretical science the end is truth, while of practical science it is work; for

79. I.e., the vague and imperspicuous ways in which "the first philosophy concerning all things" expressed itself about the starting-points and causes. Reading τοιούτων.
80. 1.3–9.
81. I.e., the starting-points and causes.
82. The odd title of this book has been taken to indicate the difficulty that the original editors of the *Metaphysics* had in understanding its place in the overall scheme of things.
83. *Ph.* 184a10–b14.

whenever practical people investigate how things stand, what they get a theoretical grasp on is the cause, not intrinsically but in relation to something and now. But we do not know the truth without the cause. Each [affection] belongs most of all to something when it is because of it that a synonymous affection also belongs to other things—for example, fire is the hottest thing; for in fact it is the cause of heat in other things. And so what is also most true is what causes all derivative things to be true. That is why the starting-points of the eternal beings must be most true (for they are not [merely] sometimes true, nor is there any cause of the being for them, but rather they themselves are a cause of it for the others), so that as each thing is as regards being, so it is too as regards truth.

2.2
There Must Be Some Starting-Point or Primary Cause of the Beings

But that there is some starting-point, and that the causes of the beings are neither **994a1** an unlimited series nor unlimited in form, is clear. For neither is it possible for one thing to come from another, as from matter, without limit (for example, flesh from earth, earth from air, air from fire, and so on without stopping), nor is it possible for the starting-point from which the movement comes to be such (for example, for a human being to be moved by air, air by sun, sun by strife, and so on without limit). Similarly, the for-the-sake-of-which cannot go on without limit either (for example, walking for the sake of health, this for the sake of happiness, and happiness for the sake of something else, and so one thing always being for the sake of another), and in the case of the essence it is the same way.

For of intermediate things [in a series], since there is a last one and a prior one, the prior one must be the cause of the things that come after it. For if we had to say which of the three was the cause, we would say the first; for it certainly is not the last, for the final one causes nothing. But then it is not the intermediate one either, for it is the cause of only one thing (and it makes no difference whether there is one intermediate thing or more than one, or whether they are unlimited or limited in number). But of series that are unlimited in this way, and of what is unlimited generally, all the parts are alike intermediate things down to now, so that if indeed there is no first one, there is no cause at all.

But the series cannot go downward in this way without limit either, with a starting-point above, so that from fire comes water, from water earth, and in this way some other kind of thing is always coming to be. For one thing comes from (*ek*) another in two ways (apart from that in which *ek* means "after," as in "the Olympic Games come *ek* the Isthmian"), either the way in which a man comes from a child by the child's changing or the way in which air comes from fire. A man is said to come from a child in the way that what has come to be comes from what is coming to be, or as the completed thing comes from the thing that is being completed; for there is

always an intermediate, so that just as between being and not being there is coming to be, so too the thing that is coming to be is between the thing that is and the thing that is not; for the person who is learning is coming to be someone with scientific knowledge, and this is what is meant when we say that from someone who is learning comes someone with scientific knowledge. But when something comes from another thing in the way that water comes from air, the other thing ceases to be. That is why the former sort is not reversible, and a child does not come from a man; for it is not what comes to be something that comes to be as a result of coming to be but what exists after the coming to be [is complete], and it is in this way too that the day comes from the morning, because it comes after the morning, which is why the morning does not come from the day. But the other sort is reversible. In both, however, it is impossible for them to go on without limit; for in the former sort the intermediates must have an end, and in the latter the change is reversible; for the passing away of either is the coming to be of the other.

At the same time, however, it is also impossible that the first [cause], since it is eternal, should pass away; for since coming to be is not without a limit in the upward direction, the first thing from whose passing away something came to be must be non-eternal.

And since the for-the-sake-of-which is an end, and the sort of end that is not for the sake of other things, but rather other things are for its sake, it follows that if there is to be a last thing of this sort, the series will not be without a limit, but if there is no such thing, there will be no for-the-sake-of-which. Those who make it unlimited are unwittingly getting rid of the nature of the good (and yet no one would try to do anything if he were not going to come to a limit). Nor would there be any understanding present in the beings; for someone who has understanding, at any rate, always does the actions he does for the sake of something,[84] and this is a limit; for the end is a limit.

But then neither can the essence be referred back to another definition that is fuller in account; for it is always that which comes before that is more a definition, and not that which comes after, and if the first one is not a definition, neither is the last. Further, those who speak that way do away with scientific knowledge; for it is not possible to have knowledge until one comes to indivisibles.[85] And there is no knowledge; for how can there possibly be understanding of what is unlimited in this way? For it is not like the case of a line, the divisibility of which does not stop, but which one cannot understand without making a stop.[86] That is why one who is traversing what is unlimited cannot count the cuts, but rather the whole line must be understood by something that does not move [from cut to cut].[87] Also, there can be

84. *NE* 1094a18–22, *EE* 1214b6–11.
85. *APo*. 79a33–36.
86. *Ph*. 247b11–13, *DA* 407a32–33.
87. Reading τὴν ὅλην οὐ κινουμένῳ. See 1075a5–10.

nothing that is unlimited, and if that is not so, the [definition of] what is unlimited is not unlimited, at any rate.

But then if the forms of cause were unlimited in number, knowledge would again be impossible; for we think we know when we know the causes, but what is unlimited by addition cannot be gone through in a limited time.

2.3
Diverse Modes of Argument

Lectures, however, produce their effects in accord with people's habits; for we expect them to be spoken in the manner we are accustomed to, and anything beyond this **995**[a]**1** appears not to have the same strength but to be something quite unknown and quite strange; for it is the customary that is familiar. Indeed, its extraordinary strength is indicated by our customs, where mythical and childish stories about things have greater power than knowledge about them, because of habit.

Some people, then, do not accept what someone says if it is not stated mathematically, others if it not based on paradigms, while others expect to have a poet adduced as a witness. Again, some want everything expressed exactly, while others are annoyed by what is exact, either because they cannot string all the bits together or because they regard it as nitpicking; for exactness does have something of this quality, so that, just as in business transactions, in the case of arguments too, it seems to have something unfree about it.

That is why one must already have been well educated in what way to accept each argument,[88] since it is absurd to look for scientific knowledge and for the way [of inquiry][89] characteristic of scientific knowledge at the same time—and it is not easy to get hold of either. And the argumentative exactness of mathematics must not be demanded in all cases, but only in the case of things that include no matter.[90] That is why the way of inquiry is not that characteristic of natural science; for presumably every nature includes matter.[91] That is why what nature is must first be investigated; for that way it will also be clear what natural science is concerned with, and whether it belongs to one science or to more than one to get a theoretical grasp on causes and starting-points.[92]

BOOK 3 (BETA)

3.1[93]
Puzzles (P1–14) about Primary Starting-Points and Causes

It is necessary, with a view to the science being inquired about, first to go over issues about which one should first raise puzzles. These include both issues about which people have supposed divergent things, as well as any separate from these that may have been overlooked. For those who wish to be puzzle-free it furthers the work to go through the puzzles well; for the subsequent puzzle-free condition is reached by untying the knots produced by the puzzles raised in advance, and it is not possible to untie a knot one is unaware of. But a puzzle in thought indicates the existence of a knot in the subject matter; for insofar as thought is puzzled it is much the same as people who are tied up; for in both cases it is impossible to move forward.

That is why one should look at all the difficulties beforehand, both for these reasons and because those who inquire without first going through the puzzles are like people who do not know where they have to go. And, in addition, a person [who has not already looked at the puzzles] does not even know whether[94] he has found what he is inquiring about; for to someone like that the end is not clear, while to a person who has gone through the puzzles beforehand it is clear. Besides, a person is necessarily in a better position to make a judgment when—as if they were opposing parties in a court case—he has heard all the contending arguments.

[P1] The first puzzle is concerned with the issues we went through the puzzles about in our prefatory remarks,[95] whether it belongs to one science or to more than one to get a theoretical grasp on causes.

[P2] And whether it is only the primary starting-points of substance that science has to look at, or whether it is also concerned with the starting-points on which everyone depends when proving things—for example, whether or not it is possible to affirm and deny one and the same thing at the same time, and other such starting-points.

[P3] And if it is concerned with substance, whether there is one science concerned with all of them or more than one, and if more than one, whether they are all of the same kind or some of them must be called "sorts of wisdom" and others something else.

[P4] And this itself is also one of the things that it is necessary to inquire about—whether only perceptible substances should be said to exist or also others beyond these, and [if so] whether there is one kind of these substances or several kinds, as

93. The puzzles listed in 3.1–2 as P1, P2, . . . are in many cases returned to in 11.1–2, where they are listed as P_1, P_2, ... The numberings of the two lists do not always exactly correspond.
94. Reading οὐδ' εἴ ποτε.
95. Books 1 and 2.

is supposed by those who introduce both the Forms and the objects of mathematics that are intermediate between them and the perceptibles.[96]

[P5] These, then, as we say, must be investigated, and also whether the theoretical investigation [we are discussing] is concerned with substances only or also with the intrinsic coincidents of substances. In addition, concerning same and other, like and unlike, and contrariety, and concerning prior and posterior, and all the other things of this sort that dialecticians try to investigate, making their investigation on the basis of acceptable beliefs only—whose task is it to get a theoretical grasp on all these? Further, on the intrinsic coincidents of these very things, and not only what each of them is, but also whether one thing is the contrary of one thing.

[P6] Also, on whether the starting-points and elements are the kinds or the components present in each thing, into which it is divided.

[P7] And if they are the kinds, whether they are the first ones or the ultimate ones that are said of indivisible things—for example, whether animal or human is a starting-point and is to a higher degree beyond what is particular.

[P8] Above all, one must inquire about and must study whether or not there is something,[97] beyond the matter, that is an intrinsic cause, whether or not this is separable, whether it is one or more than one in number, and whether there is something beyond the compound (I mean by "the compound" whenever something is predicated of matter) or nothing, or whether for some there is, while for others there is not, and what sorts of beings these are.

[P9] Further, whether the starting-points are definite in number or in form, both those in the accounts and those in the underlying subject. **996^{a}1**

[P10] Also, whether the starting-points of what passes away and of what does not pass away are the same or distinct, and whether none of them passes away or those of things that pass away do pass away.

[P11] Further, the most difficult of all and the one involving the most puzzles—whether one and being are not, as the Pythagoreans and Plato used to say, another thing, but rather the substance of the beings, or whether this is not so but the underlying subject is another thing, which Empedocles says is love, someone else, fire, someone else, water or air.

[P12] Also, whether the starting-points are universal or like particular things.

[P13][98] Further, whether they are [causes] potentially or actively, and further whether they are [causes] in any other way than as regards movement; for these issues too cause much puzzlement.

[P14] In addition, whether or not numbers, lines, figures, and points are substances of some sort or not, and if they are substances, are they separate from the perceptible ones or components present in them?

96. 987^{b}14–18.
97. I.e., the form.
98. No parallel in Book 11.

For concerning all these not only is it difficult to be in puzzle-free possession of the truth but it is not easy even to go through the puzzles well in the account.

3.2
Discussion of P1–5

[P1] The first, then, concerns the things mentioned first, whether it belongs to one science or to more than one to get a theoretical grasp on all the kinds of causes. For how could it belong to one science to know the starting-points if these are not contraries?[99]

Further, to many of the beings not all the starting-points pertain; for in what way can there be a starting-point of movement for immovable things?[100] Or in what way can the nature of the good be such a starting-point, if indeed everything that is good intrinsically and because of its own nature is an end and a cause in this way, that for its sake the other things both come to be and are, and if the end—that is, the for-the-sake-of-which—is an end of some action, and all actions involve movement? So in the case of immovable things this starting-point could not exist, nor could there be any good-itself. That is why in mathematics too nothing is proved through this cause, nor is there any demonstration where the cause is this: because it is better or worse. Indeed, no one mentions any such thing at all, so that, because of this, some of the Sophists—for example, Aristippus—used to shower abuse on mathematics; for in the other crafts, even manual ones like carpentry and shoemaking, the cause is always stated in terms of better or worse, while the mathematical sciences take no account of good and bad things.[101]

996b1 But then if there are several sciences of the causes, and a distinct one for each starting-point, which of them must one say is being inquired about? Or which of those who possess these sciences must one say has the highest degree of scientific knowledge of the object of the inquiry? For it is possible for all the ways of being causes to pertain to the same thing—for example, in the case of a house the source of the movement is the craft or the builder, the for-the-sake-of-which is the work,[102] the matter is earth and stones, and the form is the account. Based on our earlier determinations[103] about which of the sciences should be called "wisdom," then, there is reason to apply the term to each; for insofar as wisdom is most ruling and most leading, and insofar as, like with handmaidens, it is not just for the other sciences ever to contradict it, it is the science of the end and of the good that is of the same sort as wisdom (for other things are for the sake of the end and the good). And insofar as

99. I.e., not in the same kind. See *Cat.* 14a19–20.

102. 1050a21–22.
103. 982a8–19.

wisdom was determined[104] to be about the primary causes and about what is most scientifically knowable, it is the science of substance that would be of the same sort as it; for since people may scientifically know the same thing in many ways, we say that the person who knows what the thing is by its being knows it better than the person who knows it by its not being, and of those who know it better some know it better than others, and the person who knows it best is the person who knows its what-it-is, not the person who knows [merely] its quality or quantity or what it can naturally do or have happen to it. Further, in other cases too, even those of which there are demonstrations,[105] we think that there is knowledge of each thing when we know what-it-is—for example, what squaring a rectangle is, that it is the finding of a mean, and similarly in other cases. And about comings to be and actions, and about every sort of change, we think there is knowledge when we know the starting-point of the movement; but this is distinct from and opposed to the end, so that it might seem that for each of these causes it belongs to a distinct science to get a theoretical grasp on it.

[P2] But then about the starting-points of demonstration too, and whether there is one science of them or more than one, there is dispute (by "the starting-points of demonstration" I mean the common beliefs on the basis of which we all prove things, such as that in every case it is necessary either to affirm or deny, and that it is impossible for something at the same time to both be and not be, and any other propositions like that), about whether there is one science of these and of substance or distinct ones, and, if it is not one science, which of the two should be identified with what is being inquired about now?

For there to be one science of them is not reasonable; for how is it more special to geometry than to any science whatever to comprehend them? So if indeed it belongs to every science alike to comprehend them, but cannot belong to all [as their special subject], then, just as it is not special to the others, neither is it special to the science that knows substances to know about them. At the same time, indeed, in what way can there be a science of them? For what each of them in fact is we know even now—at any rate, even the various crafts make use of them as things that are known. But if there is a demonstrative science[106] concerned with them, there will have to be some hypothesized kind, as well as affections, on the one hand, and axioms pertaining to them, on the other (for it is impossible for there to be demonstrations of everything), for demonstration is necessarily from some things, about some things, and of some things. So it follows that all provable things belong to some one kind, for all demonstrative sciences make use of the axioms.

But then if the science of substance and the science concerned with the axioms are distinct, which of them naturally has more control and is prior? For it is the

104. 982^{a}30–^{b}2.

106. *APo*. 76^{b}11–22.

axioms that are most universal and the starting-points of all things, and if not to the philosopher, to whom does it belong to get a theoretical grasp on what is true and what is false about them?[107]

[P3] And, in general, as regards substances, is there one science of all of them or more than one? If there is not just one, to what sorts of substance must this science be assumed to pertain? But it is not reasonable that there should be one of all of them; for then there would also be one demonstrative science of all [intrinsic] coincidents—if indeed every demonstrative science gets a theoretical grasp on the intrinsic coincidents of some underlying subject on the basis of the common beliefs. Therefore, to get a theoretical grasp on the intrinsic coincidents of the same kind on the basis of the same beliefs belongs to the same science. For of the "what about" there is one science and of the "on the basis of which" there is one science too (whether the same one or a distinct one), and so the coincidents are also theoretically grasped either by these sciences or by one composed of them.

[P5] Further, is the theoretical investigation concerned with substances alone or also with their [intrinsic] coincidents? I mean, for example, if the solid is a sort of substance and so are lines and planes, does it belong to the same science to know these and the [intrinsic] coincidents of each kind, of which the mathematical sciences provide proofs, or to another science? If to the same one, the science of substance would also be a demonstrative science, but there does not seem to be a demonstration of the what-something-is. But if it belongs to another science, which of them is going to get a theoretical grasp on the [intrinsic] coincidents of substance? This is a very difficult question.

[P4] Further, must only the perceptible substances be said to exist, or also others beyond these? And is there one kind or are there in fact several kinds of these substances—as those say who assert the existence both of the Forms and of the intermediates, with which they say the mathematical sciences are concerned? The way in which we say that the Forms are both causes and intrinsically substances has already been stated in our first accounts of them.[108] But while Forms involve difficulties in many places, none is stranger than to say that there are certain natures beyond those in the heaven as a whole, and that these are the same as perceptibles, except that they are eternal while the latter pass away; for they say that there is man-itself and horse-itself and health-itself, and nothing else—much the same as those who introduce gods, but say that they are human in form; for those people were making the gods nothing but eternal human beings, and these are making the Forms nothing but eternal perceptibles.

Further, if beyond the Forms and the perceptibles someone is going to posit the intermediates, he will face many puzzles; for it is clear that there will be lines beyond the lines themselves and the perceptible lines, and similarly with each of the other

107. Answered at 1005b5–8.
108. 1.6, 1.9.

kinds. So if indeed astronomy is one of the mathematical sciences, there will also be a heaven beyond the perceptible heaven, as well as a sun and a moon, and similarly with the other bodies throughout the heaven. And yet how is one to be persuaded of these things? For a thing of this sort to be immovable is not reasonable, but for it to be moving is altogether impossible. It is the same way for the things that optics busies itself with and those in harmonics; for in fact it is impossible—due to the same causes—for them to be beyond the perceptibles; for if there are intermediate perceptibles and perceptions, it is clear that there will also be animals that are intermediate between the animals themselves and those that pass away.[109]

But one might also raise this puzzle: with regard to which sorts of beings should one look for these sciences [of intermediates]? For if geometry is to differ from measurement only in this respect, that measurement is of things we perceive, while geometry is not, it is clear that there will also be a science beyond medicine (and beyond each of the others), intermediate between medicine-itself and the medicine for the things that exist here. And yet how is this possible? For there would also have to be healthy things beyond the perceptible ones and the healthy-itself. At the same time, not even this is true, that measurement is of perceptible magnitudes that pass away; for it would then pass away when they did.

But then [geometry] would not be concerned with perceptibles either, nor would astronomy be concerned with the heaven that is here. For perceptible lines are not the way a geometer says lines are; for no perceptible thing is straight or round in the way he says they are; for a circular hoop makes contact with a ruler not at a point but [along a line,] as Protagoras used to say it did when refuting the geometers—nor are the movements and spirals of the heaven like those about which astronomy produces its accounts, nor do points have the same nature as stars.

There are some,[110] however, who say that these so-called intermediates between the Forms and the perceptibles exist, although not separate from perceptibles, at any rate, but rather in them. To go through all the impossible consequences of these views would require too long an account. It is enough to get a theoretical grasp even on the following ones: It is not reasonable, after all, that this should hold only of the intermediates; rather, it is clear that the Forms too might exist in the perceptibles; for the same argument applies to both of them. Further, it follows that two solid things are necessarily in the same place, and that [the intermediates] are not immovable, since they, at any rate, are in things that are moving—namely, perceptibles. And, in general, for the sake of what would someone posit that they exist but that they exist in perceptibles? For the same strange consequences will follow that have already been

109. The intermediate perceptibles, as different from the familiar ones, would have to be detected by perceptual modalities other than the familiar five, since perceptual modalities are individuated and defined by their objects (*DA* $415^{a}14$–22). These new intermediate perceptual modalities, in turn, would have to be possessed by new intermediate animals.

110. Reference unclear. Perhaps the Pythagoreans.

mentioned, that there will be a heaven beyond the heaven, only not separate from it, but rather in the same place—which is precisely what is more impossible.

3.3
Discussion of P6–7

[P6] As regards these issues, then, there is much puzzlement both about the way things should be put in order to hit on the truth, and about the starting-points, whether it is the kinds that should be supposed to be elements and starting-points or, rather, the primary components present in each thing. For example, the elements and starting-points of voiced sound seem to be those primary things from which voiced sounds are composed, not the common [kind]—voiced sound. And we speak of the elements of diagrams as those things whose demonstrations are present in the demonstrations of the other things, either of all of them or of most. Further, both those who say that there are several elements of bodies and those who say that there is one speak of the things from which a body is composed as starting-points. For example, Empedocles says that fire, water, and those that come after these are elements present in the beings from which these beings are composed, but does not speak of these as kinds of beings. In addition to this, if one wishes to examine the
998b1 nature of other things (for example, a bed), when one knows the parts from which it is composed and the way they are arranged, one knows its nature. On the basis of these arguments, then, the kinds would not be the starting-points of the beings.

But insofar as[111] we know each thing through definitions, and the kinds are the starting-points of definitions, it is necessary for the kinds too to be the starting-points of the definable things. And if to get scientific knowledge of the beings is to get it of the forms in accord with which the beings are said [to be what they are], the kinds are starting-points, at any rate, of the forms. And some even of those who speak of one or being or the great and small as elements of the beings apparently treat them as kinds.

But then neither is it possible to speak of the starting-points in both ways. For the account of the substance is one, while the definition by means of kinds will be distinct from the definition that states the components present in a thing.

[P7] In addition to this, even if it is the kinds that are to the highest degree starting-points, is it the primary kinds that one should acknowledge as starting-points or the ultimate ones, which are predicated of the indivisibles? For this too admits of dispute. For if the universal ones are always to a higher degree starting-points, it is evident that the highest of the kinds [will be to the highest degree starting-points]; for they are said of all things. There will then be as many starting-points of the beings as there are primary kinds, and so being and one will be starting-points and substances;

111. Reading ᾗ̂.

for these are to the highest degree said of all the beings.[112] But it is not possible that either one or being should be a single kind of the beings; for it is necessary for the differences in each kind to each both be and be one, but it is impossible either for the forms of the kind to be predicated of their own proper differences or for the kind to be predicated without its forms. So if indeed one is a kind or if being is, no difference will either have being or be one. But then if they are not kinds, neither will they be starting-points, if indeed the kinds are the starting-points.

Further, the intermediate ones, taken together with the differences, will also be kinds, down to the indivisible ones, but as things stand some seem to be kinds and others do not. In addition to this, the differences will be starting-points to a still higher degree than the kinds. But if these too are starting-points, the starting-points become (one might almost say) unlimited in number, especially if one assumes the primary kind as a starting-point. But then, if one, at any rate, is to a higher degree **999^{a}1** the form of thing to be a starting-point, and what is indivisible is one thing, and everything that is indivisible is so either in quantity or in form, and what is so in form is prior, and the kinds are divided into forms, the ultimate kind predicated of a thing would be to a higher degree one; for the human being is not the kind of certain human beings.

Further, in the case of things among which there is priority and posteriority, what is over them cannot be something beyond them. For example, if two is the first of the numbers,[113] no number will exist beyond the forms of numbers. Nor, similarly, will there be a [geometrical] figure beyond the forms of figures. But if not of these things, there will hardly be kinds beyond the forms of other ones; for of these above all there seem to be kinds.[114] (But among the indivisibles,[115] one is not prior and another posterior.) Further, where one thing is better and another worse, the better is always prior, so that of these also there would not be a kind.

On the basis of these considerations, then, those predicated of indivisibles appear to be starting-points rather than the [primary] kinds. But again, in what way one should suppose these to be starting-points is not easy to say. For the starting-point, or the cause, must exist beyond the things of which it is a starting-point and must be capable of existing as separated from them. But why should one suppose any such thing to exist beyond the particular things, besides the fact that it is predicated universally and of all of them? But again if it is because of that, one must assume the more universal ones to be starting-points to a higher degree; so the primary kinds would be starting-points.

112. Reading τῶν ὄντων.
113. Since it is the first plurality ($1056^{b}25$–27, $1085^{b}10$).
114. $999^{a}6$–12 is thought to be part of a fragment of Xenocrates (F41 Isnardi).
115. Individuals, not indivisible forms.

3.4
Discussion of P8–11

[P8] Connected with these there is a puzzle, most difficult of all and most necessary to get a theoretical grasp on,[116] to which the account now turns. For if nothing exists beyond the particular things, and the particular things are unlimited in number, how is it possible to get scientific knowledge of unlimited many things? For it is insofar as they are one and the same thing, and insofar as something universal belongs to them, that we know all things.

But then, if this is necessary, and there must exist something beyond the particulars, it will be necessary that the kinds exist beyond the particulars—either the ultimate kinds or the primary ones. But we just went through a puzzle[117] concerning the impossibility of this. Further, if something exists most of all beyond the compound (I mean by "compound" whenever something is predicated of the matter)—if it exists, is it beyond all of them [that is, all the compound things] that it must exist, or beyond some but not others, or beyond none?

999b1 If nothing exists beyond the particular things, there will be nothing intelligible, but all will be perceptible, and there will be no scientific knowledge of anything, unless someone says that perception is scientific knowledge. Further, nothing will be either eternal or immovable; for all perceptibles pass away and are in movement. But then, if nothing is eternal, neither is it possible for anything to be a coming to be. For there must be something that comes to be and something from which it comes to be, and of these the last one cannot have come to be, if indeed there is a stopping point and if coming to be from not being is impossible. Further, if coming to be and movement exist, there must also be a limit; for no movement is unlimited, but every one has an end, and what cannot come to be cannot be coming to be, and what has come to be must be at the first moment it has come to be. Further, if indeed the matter exists because it cannot have come to be, it is yet much more reasonable that the substance—the thing that matter is coming to be—should exist; for if neither the substance nor the matter is to exist, nothing at all will exist. And if that is impossible, something must exist beyond the compound, namely, the shape—that is, the form.

Again, if one is to posit this, there is a puzzle: in which cases is one to do so and in which not? For that one cannot do so in all cases is evident; for one could not posit a house that is beyond the particular houses. In addition to this, will the substance of all things be one—for example, of all men? But that would be strange; for all those things are one of which the substance is one. But are they[118] then many and different?

116. P11 (1001a4–5) and—by implication—P10 (1000a5–6) are also singled out as especially difficult.

117. P7.

118. I.e., entities such as man-itself, which are the substance of a corresponding many. So if these are many and different, then there will be man-itself$_1$, man-itself$_2$, and so on.

But this too is unreasonable. At the same time, in what way does the matter come to be each of these things, and in what way is the compound both of these things?[119]

[P9] Further, about the starting-points, one might also raise this puzzle. If they are one in form,[120] nothing will be one in number, not even the one-itself and being. And how will there be scientific knowledge, if there does not exist something that is a one over all?

But then, if they are one in number, that is, if each of the starting-points is one, and not, as in the case of perceptibles, different for different perceptibles (for example, the starting-points of this syllable, which is the same in form [as that], are also the same in form and [not in number]; for in fact they belong to syllables that are distinct in number)—if they are not one in the latter way, but instead the starting-points of the beings are one in number, nothing else will exist beyond the elements; for whether one says "one in number" or "particular" makes no difference; for by "particular" we mean one in number, and by "universal" we mean what is over particulars. So it is just like this: if the elements of voiced sound were definite in number, it would be necessary for all of literature to amount to the number of these elements, since there could not, at any rate, be two or more of the same ones.

[P10] No less a puzzle than any has been passed over both by people now and by previous ones, whether the starting-points of things that can pass away and things that cannot pass away are the same or distinct. For if they are the same, how is it that some things can pass away, while others cannot pass away, and due to what cause?

The followers of Hesiod and all the theologians thought only of what was persuasive to themselves, but had contempt for people like us; for they made the starting-points to be gods and what is born from gods, and say that those who did not taste nectar or ambrosia became mortal, clearly using terms familiar to themselves. And yet about the very ingestion of these causes they have spoken over our heads; for if it is for the sake of pleasure that the gods touch these, nectar and ambrosia are in no way the causes of their being; but if these are the causes of their being, how could the gods be eternal, since they need nourishment?

In the case of myth-like sophistries a serious investigation is not worthwhile, but one should cross-question those who use the language of demonstration to learn from them why precisely from the same things come, on the one hand, the beings that are eternal in nature and, on the other, the beings that pass away. But since they neither mention a cause nor is it reasonable that things should be this way, it is clear that the starting-points and causes of these things cannot be the same. For even the very person one might think speaks most consistently, Empedocles—even he suffers from the same deficiency; for he posits a starting-point, strife, as a cause of passing away, but this would seem to be no less a cause of coming to be [for everything] apart

119. I.e., both matter and form.
120. 1016^{b}36.

from the one; for from strife come all the other things except the god. At any rate, he says,

> From which all things—those that were, those that are, those that will be hereafter[121]—
> Trees, and men and women, took their growth,
> and beasts and birds and water-nourished fish,
> and long-aged gods.[122]

1000[b]**1** But quite apart from these lines it is clear; for if strife had not been present in things, all things would have been one, as he says; for whenever these come together, "strife was taking a stand at the lastmost place."[123] That is also why it follows for him that the happiest god is less wise than the others; for he does not know all things; for he does not have strife [in him], and knowledge is of like by like. "For by earth," he says,

> we see earth, by water, water,
> By ether, divine ether,
> By love love, and strife by baneful strife.[124]

But—and this is the place from which our account began—this is evident, at least, that it follows for him that strife is no more the cause of passing away than of being, nor love likewise the cause of being, for by bringing the other things together into the one it causes them to pass away. And at the same time he says nothing about the cause of the changeover itself, except that it is naturally that way:

> But when great strife was nourished in the limbs [of the sphere],
> He leapt up to claim his office as the time was fulfilled,
> Which had been fixed for their exchange by a broad strong oath,[125]

as if it were necessary for there to be a changeover. But he makes no cause of the necessity clear. Nonetheless, thus far at least he alone does speak consistently; for he does not make some of the beings capable of passing away and others incapable of passing away, but makes all of them capable of passing away, except the elements. But the puzzle now being spoken about is why one lot is one way and the other the other, if indeed they come from the same starting-points.

As regards the fact that the starting-points [of the two] cannot be the same, then, let that much be said. But if there are distinct starting-points, one puzzle is whether these too will be incapable of passing away or capable of passing away. For if they

121. Reading ὅσα τ' ἦν ὅσα τ' ἔσθ' ὅσα τ' ἔσται ὀπίσσω.

123. B36 DK.
124. B109 DK (*DA* 404[b]13–15).
125. B30 DK.

can pass away, it is clearly necessary for these also to come from certain things; for all things that pass away do so into the things they come from. So it follows that other starting-points are prior to the starting-points. But this is impossible, both if the series comes to a stop and if it goes on without limit. Further, what way will things that can pass away be, if their starting-points are to be done away with? But if the starting-points cannot pass away, due to what will things that can pass away come from these things that cannot pass away, while from the other ones it is things that cannot pass away? For this is not reasonable—on the contrary, either it is impossible or it would require much argument. Further, no one has even tried to posit other starting-points [for the two sorts of things]; instead, they say that the starting-points of all things are the same. But they sidestep the first puzzle as if they took it to be something trivial.

[P11] Among all of the puzzles, however, and the one it is also most difficult to get a theoretical grasp on, and most necessary for knowledge of the truth, is whether being and one are really substances of the beings, and whether each of them is—not by being another thing—one and being respectively, or whether one should inquire about what being really is and what one really is on the supposition that some other nature underlies them as subject. For some people think their nature is of the former sort, others of the latter sort. For Plato and the Pythagoreans[126] think that neither being nor one is another thing, but that this is what the nature of each of them is, on the supposition that the substance of it is to be one or to be being. Those concerned with nature, however, [take the latter view]. For example, Empedocles—supposing that he was leading it back to something more familiar—says what the one is; for he would seem to say that love is something of this sort. At any rate, this is for all things the cause of their being one. But other people say that fire, and others that air, is the one and the being in question, from which the beings are and have come to be. Those who posit a plurality of elements also hold the same view; for they too must say that one and being are precisely as many as the starting-points that they say exist.

However, if one does not assume that one and being are some sort of substance, it follows that none of the other universals exists either; for these are the most universal of all. And if there is not some one-itself and being-itself, there would scarcely be any others that are beyond the so-called particulars. Further, if one is not substance, it is clear that number would not exist either as a nature separated from the beings; for number is composed of units, and the unit is precisely what a certain sort of one is. But if there exists some one-itself and being-itself, one and being must be their substance; for it is not another thing that is predicated of them, but these themselves.

But then if there is to be some being-itself and one-itself, there is much puzzlement as to how anything else will exist beyond these—I mean, as to how the beings will be more than one. For what is other than being is not, so that, according to Parmenides' argument, it necessarily follows that all the beings are one, and this one is being.

126. $987^{a}13$–19.

1001b1 Either way, it is difficult; for whether one is not substance or whether there is some *one*-itself, number cannot be substance. Why this holds if one is not substance was stated previously; but if it is substance, the puzzle is the same as that concerning being. For from what, beyond the one-itself, will there be another one? For it must be not one. But all the beings are either one or a many of which each is one.

Further, if the one-itself is indivisible, according to Zeno's axiom it would be nothing; for what neither makes larger when added nor smaller when subtracted, he says, has no being—on the supposition, clearly, that a being is a magnitude, and that if it is a magnitude, it is corporeal; for body has being in every [dimension], while other things—for example, a plane and a line—will make larger when added in one way, but when added in another way will not do so, but a point and a unit in no way make something larger. But since he gets a theoretical grasp on the matter in a crude way, and it is possible for something indivisible to exist, so against him too there is some defense; for something indivisible will not make a larger magnitude by being added, but will make a larger number. Yes, but how from a one of the relevant sort, or from several such ones, will a magnitude come? For it is like saying that a line comes from points.

But then, even if one supposes the case to be such that, as some people say, number comes from the one-itself and from something else that is not one, nonetheless one must inquire about why and how what comes to be is sometimes a number and sometimes a magnitude, if indeed the not one in question was the unequal and was the same nature [in both instances]. For that there is no way in which magnitudes could come to be from one and this nature, or from some number and this nature, is clear.

3.5
Discussion of P14

[P14] Following these issues is a puzzle as to whether numbers, bodies, planes, and points are substances or not.[127] For if they are not, it escapes us what being is and what the substances of the beings are; for affections, movements, relatives, dispositions, and ratios do not seem to signify the substance of anything; for all are said of some underlying subject and none is a this something. And, as for the things that would seem most of all to signify substance, water and earth and fire and air, from **1002a1** which composite bodies are composed, heat and cold and the like are affections of these, not substances, and only the body possessed of these affections persists as a sort of being, that is, a sort of substance. But then body is certainly substance to a lesser degree than surface, surface than line, and line than unit and point; for it is by these that body is defined, and it seems possible for them to exist without body but

127. In the list of puzzles given in 3.1, P14 (996a13–15) has a second component.

impossible for body to exist without them. That is why, while most thinkers and the earlier ones thought that substance and being were body and that other things were affections of this, so that the starting-points of bodies were also the starting-points of the beings, later and seemingly wiser thinkers[128] thought that these were numbers. As we said, then, if these are not substances, there is no substance or being at all—for the coincidents of these, at any rate, certainly do not deserve to be called "beings."

But then, if it is agreed that lines and points are substance to a higher degree than bodies, but we do not see to what sort of bodies they might belong (for it is impossible for them to be in perceptible ones), no substance would exist at all. Further, it is evident that all these things are divisions of bodies—one in breadth, one in depth, one in length.

In addition to these, any shape whatever is present in the solid in the same way, or else none at all is. Thus if Hermes is not present in the stone, neither is the half of the cube present in the cube as something definite; therefore, neither is the surface; for if any surface whatever were present, so too would be the surface that determines the half. And the same argument also applies to line, point, and unit. Thus if body is in the highest degree substance, and these divisions are so more than body is, but these do not exist nor are they certain substances, it escapes us what being is, and what the substance of the beings is.

In addition to what has been said the consequences that follow concerning coming to be and passing away are unreasonable. For it seems that substance, whether it did not exist earlier but does exist now or existed earlier but does not exist later, undergoes these through coming to be and passing away. But points, lines, and surfaces neither admit of a process of coming to be nor of passing away, though at one time they exist and at another do not. For when bodies make contact or are divided, at one time (when they make contact) there immediately comes to be one surface, while at another time (when they are divided) there immediately come to be two, so that when they are put together one surface does not exist, but has passed away, while when they are divided, surfaces exist that did not exist earlier (for it certainly is not that an indivisible point has been divided into two). And if they come to be and pass away, from what do they come to be? The case is also much the same as that of the now in time,[129] since it does not admit of coming to be or passing away either, yet it seems to be always something else nonetheless, because it is not a sort of substance. It is clear that it is similar in the case of points, lines, and planes. For the argument is the same; for they are in a similar way either limits or divisions.

128. Pythagoreans and Platonists. Strictly speaking the Pythagoreans were "among these thinkers [the materialists] and before them" ($985^{b}23$), whereas the Platonists alone were later ($987^{a}29$).

129. *Ph*. $233^{b}33–35$.

3.6
Discussion of P12, P13, P14a

[P14a][130] In general, one might raise a puzzle as to why it is even necessary to look for other things beyond perceptibles and intermediates, such as the Forms that we[131] posit. For if it is because of this that the objects of mathematics, while they differ from the things here in some other respect, in there being many of the same form they do not differ at all, so that their starting-points will not be definite in number (just as the starting-points of the writings that exist here are not definite in number either, although they are so in form—provided one does not take the starting-points of this syllable here or of this voiced sound here, since of these the starting-points will be definite in number too—and similarly too in the case of the intermediates; for things of the same form are unlimited in number there as well). Thus if there are not, beyond perceptibles and the objects of mathematics, other things such as some people say the Forms are, there will not be substance that is one in number, but in form, nor will the starting-points of the beings be so-and-so many in number, but in form.[132] So, if this is necessary, it is also necessary because of it to posit that the Forms exist. For even if those who say this do not articulate it well, still this is what they mean, at least, and it is necessary for them to say these things, because each of the Forms is a sort of substance and none exists coincidentally.

But then, if we are to posit both that the Forms exist and that the starting-points are one in number, not in form, we have said[133] what impossibilities necessarily follow.

[P13] Closely connected with these issues is going through the puzzles about whether the elements are [causes] potentially or in some other way. For if it is in some other way, something else will be prior to the starting-points (for the capacity is prior to that other cause, and not all of what is capable of being in a certain way is in that way). But if the elements are [causes] potentially, it is possible that none of the other beings should exist; for even what is not still has the potentiality to be, for what is not [yet] does come to be, while none of the things that lack the potentiality to be comes to be.

[P12] So we must go through both these puzzles about the starting-points and ask whether they are universal or exist as we say particulars do. For if they are universal,

130. P14a is not listed in 3.1 and is not discussed elsewhere in *Met*. The argument seems to be this: (1) Perceptibles and intermediates resemble each other in that there are indefinitely many of each that are the same in form—many men, many triangles. (2) Therefore, their starting-points will also be indefinitely many. (3) By the same token, there will not be a substance that is one in number, since each of the substantial starting-points is one in form but many in number. (4) So there must be some one Form over the many perceptibles or intermediates, if there are to be so-and-so many substantial starting-points each of which is one in number.

131. I.e., we Platonists.

132. Reading ἀλλ᾽ εἴδει.

133. The reference could be to the discussion in 1.6 and 1.9 or to P9 in 3.4.

they will not be substances (for no common thing signifies a this something but a such-and-such sort of thing, while substance is a this something). And if we are to be allowed to posit that what is predicated in common is a this something and can be set-out,[134] then Socrates will be many animals,[135] himself and the human and the animal, if indeed each of these signifies a this something and one thing.

If, then, the starting-points are universals, these things follow. But if they are not universals, but [exist] as particulars, they will not be scientifically knowable; for the scientific knowledge of all things is universal. Thus there will be other starting-points prior to the starting-points, those that are predicated universally, if indeed there is going to be scientific knowledge of these.

BOOK 4 (GAMMA)

4.1
The Science of Being qua Being versus the Special Sciences

There is a science that gets a theoretical grasp on being qua being[136] and of the [coincidents] belonging intrinsically to it. But this is not the same as any of the so-called special sciences; for none of these investigates being qua being in a universal way. Rather, each cuts off a part of being and gets a theoretical grasp on what is a[n intrinsic] coincident of that part—as, for example, the mathematical sciences do. But since we are inquiring about the starting-points and the highest causes, it is clearly necessary that these are a certain nature's as it is intrinsically. So if those who were inquiring about the elements of the beings were inquiring about these same starting-points, it is necessary that the elements too must be elements of being, not coincidentally but qua being. That is why it is of being qua being that we must grasp the primary causes.

4.2
The Many Ways in Which Something Is Said to Be

Something is said to *be* in many ways, however, but with reference to one thing and one nature—that is, not homonymously. Rather, just as what is healthy all has reference to health, one by safeguarding it, another by producing it, one by being a sign of health, another because it is a recipient of it, and what is medical all has reference to the craft of medicine (for one thing is said to be medical by possessing the craft of **1003^{b}1**

134. Reading ἐκθέσθαι.
135. Reading ζῷα.
136. I.e., insofar as it is being.

medicine, another by being naturally well-disposed to it, another by being a result of the craft of medicine), and we will find other things that are said to *be* in ways similar to these, so too something is said to *be* in many ways, but all with reference to one starting-point; for some things are said to *be* because they are substances, others because they are affections of substances, others because they are a route to substance, or else by being passings away, privations, or qualities of substance, or productive or generative either of substance or of things that are said to *be* with reference to substance, or negations of one of these or of substance (that is why we say even of not being that it *is* not being).

And so just as of all healthy things there is one science,[137] so it is in the case of the others too. For not only in the case of things that are said to *be* in accord with one thing does it belong to one science to get a theoretical grasp on them, but also in the case of things that are said to *be* with reference to one nature; for even these are in a way said to *be* in accord with one thing. So it is clear, in the case of the beings too, that it belongs to one science to get a theoretical grasp on them qua beings. In every case, however, a science in the strict sense is of what is primary, and on which the other things depend, and because of which they are said to *be*. So if this is substance, it will be of substances that the philosopher must possess the starting-points and causes.

Of every kind that is one, there is both one perception and one science—for example, grammar, which is one science, gets a theoretical grasp on all words. That is why to get a theoretical grasp on all the forms of being qua being belongs to a science that is one in kind, and to the forms of that science to get such a grasp on their forms. {If, then, being and one are the same and one nature, in that they follow along with each other, just as starting-point and cause do, but not in that they are indicated by one account (it makes no difference if we do suppose them to be like that, but rather it in fact furthers our work); for one human, a human who is, and a human are the same thing, and nothing distinct is indicated by the reduplication of wording in "he is one human" and "he is one human who is"[138] (on the contrary, it is clear that they are separated neither in coming to be nor in passing away); and similarly in the case of being one. So it is evident that the addition in these cases indicates the same thing, and that being one is nothing beyond being. Further, the substance of each thing is one in no coincidental way, and likewise is precisely a certain sort of being.}[139] And there are as many forms of being as there are of being one, and to get a theoretical grasp on the what-it-is of each of them belongs to a science that is one in kind—I mean, for example, on same, similar, and other such things). Pretty much all of the

137. Aristotle may be thinking exclusively of human health, since he elsewhere denies that there is one science dealing with the health of animals of different forms (*NE* 1097ᵃ11–13, 1141ᵃ22–23).

138. Reading τὸ εἷς ἄνθρωπος καὶ εἷς ὢν ἄνθρωπος.

139. This material interrupts the flow of argument and should perhaps be omitted.

contraries are referred back to this starting-point. (We must take them to have been theoretically grasped in the *Selection of Contraries*.[140]) **1004ª1**

And there are precisely as many parts of philosophy as there are [kinds] of substances, so that it is necessary for there to be a primary philosophy among them and one that follows this.[141] For being and being one fall from the outset into kinds, which is why the sciences will follow these. For a philosopher is said to be what he is just like a mathematician; for mathematics also has parts, and there is a first and a second science and other successive ones within mathematics.

But it belongs to one science to get a theoretical grasp on opposites, and being many is opposed to being one, and to get a theoretical grasp on the negation and the privation belongs to one science, because in both cases we are getting a theoretical grasp on the one thing of which it is the negation or the privation. For we either say that unconditionally it does not belong or that it does not belong to some kind, and in the latter case, then, the difference is present beyond what is in the negation (for the negation is [just] the thing's absence, and in the case of the privation a certain nature is also involved that is the underlying subject of which it is said), and [to repeat] being many is opposed to being one.[142] So to know the opposites of the things mentioned—other and unlike and unequal, and everything else that is said to *be* either in accord with these or in accord with being many and being one—belongs to the science mentioned.

But contrariety is also one of these; for contrariety is a sort of difference, and difference a sort of distinctness. So, since things are said to be one in many ways, these things will all be said to *be* in many ways. Nonetheless, it belongs to one science to know all of them; for it is not when they are said to *be* in many ways that knowing all of them belongs to distinct sciences, but when they are neither said in accord with one thing nor is there one thing to which their accounts are referred back. But since all things are referred back to what is primary (as, for example, all things that are said to be one are referred back to what is primarily one), this is also what we must say holds of same, other, and contraries generally. So after determining the number of ways in which something is said to be each of them, we must then explain, by reference to what is primary in each predication, the way things are said to be in relation to that; for some things will be said to *be* by possessing it, some by producing it, others in other such ways.

It is evident, then, that it belongs to one science to have an account of these as well as of substance (this was precisely one of the puzzles[143] mentioned in the book of puzzles[144]), and that it belongs to the philosopher to be able to get a theoretical grasp on all of them. For if it does not belong to the philosopher, who will be the **1004ᵇ1**

140. The reference is probably to the lost work *On Contraries* (F152–157).
141. 1026ª18–19.
142. Retaining τῷ δὲ ἑνὶ ἀντίκειται πλῆθος.

144. Retaining ὅπερ ἐν ταῖς ἀπορίαις ἐλέχθη.

investigator of whether Socrates and Socrates seated are the same, or whether one thing has one contrary, or what a contrary is, or in how many ways something is said to be a contrary? And similarly with other questions of this sort. So, since these things are intrinsic affections of being one qua being one, and of being qua being and not qua being numbers or lines or fire, it is clear that it belongs to that science to know both what each of them is and also their [intrinsic] coincidents. And those who investigate these things[145] do not err in this way, since they are not doing philosophy, but because substance is prior and an issue about which they comprehend nothing.

For just as of number qua number there are special affections (for example, oddness, evenness, commensurability, equality, excess, deficiency), and these belong to all numbers either intrinsically or in relation to each other (and similarly there are other special affections of the solid, both immovable and movable, [and of the movable] both weightless and having weight), so too there are certain special affections of being qua being, and it is about these that it belongs to the philosopher to investigate the truth.

A sign of this is that dialecticians and sophists[146] in fact cut the same figure as the philosopher; for sophistic is only apparently wisdom, and dialecticians discuss all [these] things, and being is common to all [these], but clearly they discuss them because they properly belong to philosophy. Sophistic and dialectic, then, are indeed concerned with the same kind as philosophy, but philosophy differs from dialectic in the way its capacity is employed, and from sophistic in the life it deliberately chooses; and dialectic is examinational[147] about the issues philosophy makes known to us, while sophistic appears to do so but does not.

Further, one of the two columns of contraries is a privation, and all of them are referred back to being and not being, and to one and many (as, for example, being at rest belongs to the one, moving to the many). And pretty much everyone agrees that the beings and the substance are composed of contraries;[148] at any rate, they all say that the starting-points are contraries; for some say that they are odd and even, some that they are hot and cold, some that they are limited and unlimited, some that they are love and strife. And all these and any others are manifestly also referred back to the one and many (for let us suppose this referring back has been established), and the starting-points posited by other thinkers also fall entirely under these as their kinds.

1005^{a}1 So it is evident from these considerations too that it belongs to one science to get a theoretical grasp on being qua being. For all things either are or are derived from contraries and the starting-points of contraries are the one and many. And these belong to one science, whether they are said in accord with one thing or are not said in accord with one thing, which is perhaps in fact the truth. Nonetheless, even if

146. *SE* $171^{b}25$–34.
147. *Top*. 8.5–11, *SE* $165^{b}4$–6.
148. Cf. $1075^{a}28$–34, $1087^{a}29$–$^{b}4$.

things are said to be one in many ways, the others will be said to be one with reference to the first, and contraries similarly. And because of that[149]—and if being or one is not a universal and the same over all things or separable (as presumably it is not), but some things are said to *be* or to be one with reference to one thing, others in virtue of succession—and because of that [to repeat], it does not belong to the geometer to get a theoretical grasp on what a contrary is, or what completeness is, or what being or being one is, or same or other, except on a hypothetical basis.

It is clear, then, that it does belong to one science to get a theoretical grasp on being qua being and on the affections that it has qua being, and that the same science will get a theoretical grasp not only on substances but also on their affections, both those mentioned as well as prior and posterior, kind and form, whole and part, and others of this sort.

4.3
Axioms and the Principle of Non-contradiction

And it must be stated whether it belongs to one science or to distinct ones to get a theoretical grasp both on what in mathematics are called "axioms" and on substance. It is evident, then, that the investigation of these does also belong to one science and, besides, that the science in question is the philosopher's; for these axioms hold of all the beings, not of some special kind separate from the others. Also, because they are true of being qua being and each kind is a kind of being, all people use them. But they use them only so far as is adequate for their purposes, that is, so far as the kind extends about which they are carrying out their demonstrations.

So, since it is clear that these axioms hold of all things qua beings (for this is what is common to them), their theoretical investigation too belongs to the person who knows being qua being. That is why none of those who investigate a part [of being]—neither geometer nor arithmetician—attempts to say anything about them, as to whether or not they are true. But some natural scientists, as makes perfect sense, did do this; for they were the only ones who thought that they were both investigating nature as a whole and investigating being. But since there is someone further, higher than the natural scientist (for nature is one particular kind of being), it will belong to him whose theoretical grasp is universal and concerned with primary substance[150] also to investigate these axioms. Natural science, however, is also a sort of wisdom, but it is not the primary sort.[151] **$1005^{b}1$**

As for the attempts of some of those who speak about the truth, as to the way in which it should be accepted, they do this because of a lack of educatedness in

149. Reading καὶ διὰ τοῦτο at $1005^{a}8$.
150. $1032^{b}1–2$, $1037^{b}3–4$.
151. 6.1.

analytics; for people should come with prior scientific knowledge of analytics, not look for it while listening [to lectures in the science they are learning].

It is clear, then, that it belongs to the philosopher—that is, to the one who gets a theoretical grasp on the nature of all substance—also to investigate the starting-points of deductions. And it is fitting for the one who knows best about each kind to be able to state the most stable starting-points of his subject matter, and so when this subject matter is the beings qua beings, he must be able to state the most stable starting-points of all things. And this person is the philosopher. But the most stable starting-point of all is that which it is impossible to be deceived about; for such a starting-point must be both the best known (for it is things that people do not know that they can all be fooled about) and unhypothetical. For a starting-point that must be possessed by anyone who is going to apprehend any of the beings is no hypothesis. And what someone must know who knows anything at all, he must already possess. It is clear, then, that such a starting-point is the most stable of all.

What it is, however, we must next state, namely, that the same thing cannot at the same time belong and also not belong to the same thing and in the same respect (and let us assume that we have also added as many other qualifications as might be needed to respond to logico-linguistic difficulties). This, then, is the most stable of all starting-points; for it has the distinguishing feature that was mentioned. For it is impossible for anyone to suppose the same thing to be and not to be, as some people think Heraclitus did.[152] For it is not necessary for what someone says to also be what he supposes. But if it is not possible for contraries at the same time to belong and not belong to the same thing (and let us assume that the usual qualifications have been added to this proposition too), and if what is contrary to a belief is the belief in its contradictory, it is evident that it is impossible for the same person at the same time to suppose the same thing to be and not to be; for a person who has false views on this point would hold contrary beliefs at the same time. That is why all who are carrying out a demonstration lead it back to this as an ultimate belief; for this is by nature the starting-point of all the other axioms too.

4.4
Seven Arguments (A1–7) for the Principle of Non-contradiction

But there are some people, as we said, who themselves assert both that it is possible
1006a1 for the same thing to be and not to be and also to suppose this to be so. Many even of those concerned with nature make use of this claim. But we have just now supposed it to be impossible for anything at the same time to be and not to be, and by means of this we have proved that this is the most stable of all starting-points.

152. Presumably on the basis of B10, B60, B61, B67, B88, B111 DK.

Some people demand that one demonstrate even this, but this is due to lack of educatedness; for it is lack of educatedness not to know what things one should look for a demonstration of and what things one should not; for it is, in general, impossible to demonstrate everything (for it would go on without limit, so that even then there would be no demonstration). But if there are things one should not look for a demonstration of, these people would not be able to say what starting-point they think has more of a claim to be such.

There is, however, a demonstration by refutation that even this view is impossible, if only the disputant says something. But if he says nothing, it is ridiculous to look for an argument against someone who has an argument for nothing, insofar as he has none; for such a person, insofar as he is such, is like a vegetable. And by "demonstrating by refutation" I mean something different from demonstrating, because in demonstrating we might seem to be asking for what was initially at issue,[153] but if the other person is responsible for an assumption of this sort, it would be a refutation, not a demonstration.

The starting-point for all such arguments is to ask the disputant not to state something to be or not to be (for one might suppose this to be assuming what was initially at issue), but rather to signify something both to himself and to another person; for that is necessary if indeed he is to say something. For if he does not grant this, no argument is possible for such a person, either with himself or with another person. But if he does grant it, demonstration will be possible; for there will already be something definite. The one responsible for it, however, is not the one who gives the demonstration but the one who submits to it; for in doing away with argument, he submits to argument. Further, anyone who agrees to this has agreed that something is true without a demonstration, so that not everything will be so-and-so and not so-and-so.

[A1] First, then, this at least is clearly true: the name [agreed to signify something by the disputant] signifies is or is not this, so that not everything will be so-and-so and not so-and-so.

[A2a] Further, if human signifies one thing, let this be two-footed animal. I mean by "signifying one thing" that if human is this, then, insofar as anything is human, this will be the being for human. But even if someone were to say that the name involved signifies more than one thing, it makes no difference, provided that these were definite; for to each account a distinct name could be assigned. I mean, for example, if someone were to say that human signified not one thing but several things, of one of which the account was two-footed animal, although there were also several other accounts, but a definite number of them; for a special name would be assigned to each account. If, however, he did not assign that way, but instead said that human signified an unlimited number of things, it is evident that no argument would be possible [with him]; for not to signify one thing is to signify nothing, and if names

153. *Top*. $162^{b}34$–$163^{a}13$, *SE* 27.

do not signify, discussion with others is done away with, as in truth it is even with ourselves; for it is not possible even to understand without understanding one thing. But if it is possible, one name would be assigned to this thing.

Suppose then, as was said at the start, that the name signifies something, and that it signifies one thing. It is not, then, possible that the being for human should signify what is precisely not being for human, if human signifies not only about one thing but also one thing (for we do not think that this is what it is to signify one thing, to signify about one thing, since that way even the musical and the pale, and the human would signify one thing, so that all would be one; for they would be synonymous).

Also, it will not be possible to be and not to be the same thing except homonymously—as if what we call "human" others were to call "not human." But the puzzling thing is not this, whether it is possible for the same thing at the same time to be and not be human in name, but whether it is possible for it to be so in fact. If, however, human and not human do not signify distinct things, it is clear that neither will the not being for human signify something distinct from the being for human, and so the being for human will be the not being for human; for they will be one thing. For to be one thing signifies this: to be like mantle and cloak, if their account is one. But if they are one thing, the being for human and the being for not human will signify one thing. It has been proved,[154] however, that they signify distinct things. Therefore, if it is true to say of something that it is human, it is necessary for it to be a two-footed animal; for this is what human signified. And if that is necessary, then it is not possible for the same thing not to be at that time two-footed animal (for necessary for it to be signifies this: that it is impossible for it not to be). Therefore, it is not possible at the same time for it to be true to say that the same thing is human and is not human.

[A2b] And the same argument also applies in the case of not being human; for the being for human and the being for not human signify distinct things, if indeed even to be pale and to be human signify distinct things; for the former are much more opposed, and so signify something distinct. But if the disputant says that pale too signifies one and the same thing as human, we will say precisely the same as was said previously, that all—and not only opposites—will be one. But if that is not possible, what was stated follows, if he will answer what he is asked.

But if, when one poses the question unconditionally, he adds the negations too, he is not answering the question asked. For there is nothing to prevent the same thing from being human and pale and a thousand other things. Nonetheless, since the question was whether it is true to say that this thing is human or not, the answer should signify one thing and not add that it is also pale and large. And in fact it is impossible to go through all its coincidents, which are unlimited in number. So he should go through either all or none. In the same way, therefore, even if the same thing is a thousand times human and not human, he should not, in answering the

154. 1006b11–18.

question whether it is human, add that it is at the same time also not human, unless he is to add the other coincidents too, those that it is and those that it is not. But if he does that, he is not engaged in discussion.

[A2c] And, in general, those who say this do away with substance and essence. For it is necessary for them to say that all are coincidents and that there is no such thing as the being precisely for human or the being precisely for animal. For if anything is to be precisely [the] being for human, this will not be [the] being for not human or [the] not being for human (and yet these are its negations); for what was signified was one thing, and this was something's substance. But to signify the substance of something is to signify that the being for it is no other thing. But if for it to be the being precisely for human is either for it to be the being precisely for not human or precisely the not being for human, it will be some other thing, so that it is necessary for them to say that this sort of account applies to nothing, but that all are coincidental; for substance and coincident are distinguished by this: the pale coincides with the human because he is pale but not precisely pale.

But if everything is said coincidentally, there will be no primary thing that they are said of, if a coincident always signifies a predication of some underlying subject. Therefore, it is necessary for predication to go on without limit; but that is impossible; for no more than two things can be combined in predication; for a coincident **1007^{b}1** does not coincide with a coincident, unless it is because both coincide with the same subject. I mean, for example, that the pale is musical and the musical is pale, because both coincide with the human. But it is not the case that Socrates is musical in this way, that both [he and it] coincide with some other thing. Therefore, since some things are said coincidentally in the former way, others in the latter, those said in the way in which the pale coincides with Socrates cannot form an unlimited series in the upward direction (so that, for example, of pale Socrates some other thing is a coincident); for no one thing comes about from all of them. Nor indeed will another thing—for example, the musical—be a coincident of the pale; for it no more coincides with the pale than the pale does with it. At the same time too what coincides in this way has been distinguished from what coincides in the way in which the musical coincides with Socrates. But in cases of the latter sort the coincident does not coincide with a coincident, although in those of the former sort it does, so that not everything will be said coincidentally. Even [when things are said] in this way, then, there will be something signifying substance. And if that is so, it has been proved that contradictories cannot be predicated at the same time.

[A3a] Further, if contradictories are all true of the same thing at the same time, it is clear that all will be one. For the same thing will be a trireme, a wall, and a human, if it is possible either to affirm or deny something of all of them, as those who give the argument of Protagoras[155] must do. For if a human is believed by someone not to be a trireme, clearly he is not a trireme—so he also is a trireme, if indeed the contradictory

155. 1009^{a}6–16, 1053^{a}35–36.

is true. And the view of Anaxagoras[156] also comes about, that all things were together, so that there is nothing that is truly one. It is about the indefinite, then, that they would seem to be speaking, and while they think they are speaking about being, they are really speaking about not being; for it is potential being but not actual being that is indefinite.

But then it is necessary for them, at any rate, to assert of every subject either the affirmation or the negation of everything; for it would be strange if to each thing its negation belonged, while the negation of some other thing, which does not belong to it, did not belong to it. I mean, for example, that if it is true to say of a human that he is not a human, it is clear that he is both a trireme and not a trireme. If, then, the affirmation belongs, the negation does too. But if the affirmation does not belong to him, at least the negation belongs to him more than his own negation does. So if **1008^{a}1** even the latter belongs to him, the negation of trireme will belong to him too; and if it does, the affirmation of it will too.

[A3b] And not only does this follow for those who give this argument, but it also follows that it is not necessary either to affirm or deny. For if it is true that he is a human and not a human, it is clear that he will also be neither a human nor not a human; for of the two there are two negations, but if one is composed of the former two, it will also be opposed by one.

[A4] Further, either this applies to all of them, and a thing is both pale and not pale, both being and not being, and similarly for all other affirmations and negations, or it does not do so, but applies to some and does not apply to others. And if it does not apply to all, these could be agreed on. But if it does apply to all, once again either the negation will belong wherever the affirmation does and the affirmation will belong wherever the negation does, or else the negation will belong wherever the affirmation does but the affirmation will not always belong where the negation does. [A4a] And if the latter is the case, there will be something that is assuredly not being, and this will be a stable belief. And if not being is something stable and known, the opposite affirmation will be better known. [A4b] But if anything denied can also equally well be affirmed, necessarily either it is true to divide and say, for example, that a thing is pale and, in turn, to say that it is not pale, or it is not true. [A4b-i] But if it is not true to divide and say this, he is not really saying these things and nothing whatever has being. (How could things that do not have being walk and talk?) Also, all things will be one, as was also said previously, and the same thing will be human and god and trireme and the negations of these (for if they belong in the same way to each thing, one thing will in no way differ from another; for if it did differ, that would be true and special to it). [A4b-ii] Similarly, even if it is possible to divide and speak truly, what was said still follows, and in addition everyone will speak truly and everyone will speak falsely, and so the disputant will speak falsely by his own admission.

156. B1 DK. Also 1056^{b}28–30, 1069^{b}21.

At the same time it is evident that in response to this person there is nothing for an investigation to be about; for he says nothing. For he says neither that it is so-and-so nor that it is not so-and-so, but that it both is so-and-so and is not so-and-so; and then again he denies both of these, saying that it is neither so-and-so nor not so-and-so; for if he did not, something would already be definite.

[A5] Further, if whenever an affirmation is true, its negation is false, and whenever the negation is true, the affirmation is false, it will not be possible both to affirm and to deny the same thing truly at the same time. (But presumably disputants might say that this was the very point at issue from the start.) **$1008^{b}1$**

[A6] Further, is someone who supposes that something is some way, or that it is not some way, speaking falsely, while someone who supposes that it is both is speaking truly? For if the latter is speaking truly, what can be meant by saying that the nature of the beings is like that? But if he is not speaking truly, but is speaking more truly than someone who supposes in the former way, the beings will already be in some way, and this will be true and not at the same time also not true. And if all speak both falsely and truly to the same degree, there will be nothing for a person in that condition to utter or say; for at the same time he says this and also not this. And if he supposes nothing to be so, but instead thinks and does not think to the same degree, how would his state be any different from a vegetable's?

From this too it is entirely evident that no one—whether other people or those who give this argument—is in fact disposed in this way. For why does someone walk to Megara instead of staying where he is, when he thinks he should walk there?[157] Why does he not early one morning march straight into a well or into a ravine, if one happens to be about, instead of taking evident care to avoid doing so, as if he were someone who is not to the same degree thinking that it is not good to fall in and that it is good? Therefore, it is clear that he supposes one thing to be better and the other not better. And if this is so, he must also suppose one thing to be human and another not human, one thing sweet and another not sweet. For he does not look for and suppose all things to be equally so (for if he thinks it is better to drink water and to see a human, he proceeds to look for these things), and yet he should do so, if the same thing were to the same degree human and not human. But, precisely as was said, there is no one who does not take evident care to avoid some things and not others, so that, as it seems, everyone supposes something to hold unconditionally, if not about all things, about what is better and worse. And if this is not scientific knowledge but belief, they should be all the more concerned about the truth, just as someone who is sick should be more concerned about health than someone who is healthy. And indeed someone who has belief, when compared to someone who has scientific knowledge, is not in a healthy condition in relation to truth.

[A7] Further, even if all things may be so-and-so and not so-and-so, still more and less are, at any rate, present in the nature of the beings; for we would not say that two

157. $1063^{a}28–35$.

and three are to the same degree even, or that someone who thought that four things were five and someone who thought they were a thousand were to the same degree deceived. If, then, they are not these things to the same degree, it is clear that one of them is such to a lesser degree, so that it is more true. If, then, what is more is closer, there must be something true to which the more true is closer. And even if there is not, there is, at any rate, already something more stable and more truth-like, and we will have set ourselves free from the extreme version of the argument that prevents us from having anything definite in our thought.

4.5
Discussion of Protagoras' Argument That Man Is the Measure of All Things

The argument of Protagoras[158] also derives from the same belief, and both alike must be either true or untrue; for if all the things that seem to be so and all the appearances are true, everything must at the same time be true and false (for many people suppose things to be so that are contrary to those supposed to be so by others, and think that people who do not believe what they believe are deceived, so that it is necessary for the same thing to be and also not to be). And if that is the case, the things that seem to be so must all be true (for those who believe falsely and those who believe truly believe opposite things from each other; so if the beings are the relevant way, everyone will believe truly).

It is clear, then, that both arguments derive from the same line of thought. But the same mode of discussion must not be used in response to all the disputants one encounters; for some need persuasion, others force.[159] For the ignorance of those who suppose this to be so because they were puzzled is easily cured (for the reply to them is directed not at the argument but at the line of thought [behind it]). Those, though, who state it for the sake of argument must be cured by refutation both of the account as expressed in their speech and in the names.[160]

Those who are genuinely puzzled come to this belief from perceptibles. They believe that contradictories and contraries belong to things at the same time because they see contraries coming to be from the same thing. So if it is not possible for what is not to come to be, the thing in question must have previously been both alike. And as Anaxagoras says everything is mixed in everything, and Democritus too; for he says that the void and the full belong alike to every part whatever, and yet one of these is being and the other not being. In response to those, then, who suppose what they suppose to be so on this basis, we say that in one way they speak correctly but in

158. 1053a35–36.
159. *Top*. 105a16–19.
160. 1006b7–18.

another way they speak in ignorance; for things are said to *be* in two ways, so that in one way it is possible for something to come to be from not being, while in another way it is not, and for the same thing at the same time to be and not to be, although not in the same way; for it is possible for contraries to belong potentially to the same thing at the same time, but not to do so actually. Further, we will require them to suppose that among the beings there is also another sort of substance to which neither movement nor passing away nor coming to be at all belongs.

Similarly, some have come to believe in the truth of appearances on the basis of perceptibles.[161] For they think that it is inappropriate to judge the truth by the large or small number [of people who believe it], but that the same thing seems sweet to some who taste it, bitter to others, so that if all were sick or bereft of thought, while two or three were healthy or possessed of understanding, it is these who would seem to be sick and bereft of thought and not the others. Further, many of the other animals have appearances contrary to ours concerning the same things, and even for each one of us, relative to himself, the same things do not always seem the same to perception. Which, then, of these appearances is true or false is unclear; for the one lot is no more true than the other, but rather equally so. That is why Democritus, at any rate, says that either there is no truth or that to us at least it is unclear.

In general, however, it is because they suppose perception to be thought, and that it is an alteration, that they say that what appears to perception must of necessity be true; for it is on the basis of these views that both Empedocles and Democritus and (one might almost say) all the others have been captivated by beliefs of this sort. And Empedocles in fact says that people who change their state change their wisdom:

> For cunning increases in men in relation to what is present to their perceptual modalities.

And elsewhere he says that:

> To the extent they change over to become altered, to that extent they always find
> Their thinking too presenting other things.[162]

And Parmenides expresses himself in the same way:

> For as at each moment is the mixture of their much wandering parts,
> So is understanding present in men. For the same thing
> Is just what does the thinking, the nature of his parts,
> In each and every human being. For what predominates is what is understood.[163]

161. 1063^{a}35–^{b}7.
162. B106, B108 DK (*DA* 427^{a}22–25).
163. B16 DK.

A saying of Anaxagoras to some of his companions is also recorded, that things would be for them as they supposed them to be. People say that even Homer manifestly held this belief, because he made Hector, when he was stunned by a blow, lie there "thinking altered thoughts,"[164] as if even those bereft of thought are thinking, but not the same thoughts. So it is clear that if both are states of thinking, the beings will be so-and-so and not so-and-so at the same time. And it is insofar as this is so that the consequences are most difficult; for if those who have seen as much of the truth as is possible for us (and these are the ones who look for it the most and love it the most)—if they hold beliefs of this sort and express these views about the truth, how can one expect beginners in philosophy not to lose heart? For to look for the truth would be a wild-goose chase.

1010a1 What caused these people to hold this belief, however, was that while investigating the truth about the beings, they took the only beings to be the perceptible ones, and in these there is much of the nature of the indefinite—that is, of the sort of being described.[165] That is why, though they speak in a perfectly sensible way, they do not speak truly; for it is more fitting to put the matter like that than as Epicharmus put it against Xenophanes.[166] Further, seeing that all this sort of nature is in movement, and that about what is changing nothing true can be said, they concluded that about what is in every respect and in every way changing, at any rate, it is not possible to grasp the truth. For it was from this supposition that there blossomed the most extreme belief of the ones mentioned, that of the declared Heracliteanizers. This was also the sort held by Cratylus,[167] who in the end thought that he should say nothing, but instead only moved his finger, and criticized Heraclitus for saying that it is not possible to step into the same river twice; for he thought one could not do so even once.

We, however, in response to this argument too will say that while they do have some argument for thinking that what is changing, when it is changing, is not, and yet this, at any rate, is disputable; for what is losing something has some of what is being lost, and of what is coming to be, something must already be.[168] And, in general, if something is passing away, there will be something that it is, and if something is coming to be, there must be something from which it comes to be and something by which it is generated, and this does not go on without limit. But leaving that point aside, we may say this, that it is not the same thing to change in quantity and to change in quality. Granting, then, that a thing's quantity does not remain what it was, still it is by its form that we know each thing.

Further, those who supposed this to be so could fairly be criticized for asserting about the whole of the heaven what they saw only in a minority even of perceptibles; for the region of the perceptible realm around us is the only one that remains in

164. *Iliad* 23.698. See *DA* 404a30.
165. 1009a32–36.
166. Reference unclear.
167. 987a32.
168. *Ph.* 240a19–29.

permanent process of coming to be and passing away. But this is (one might almost say) not even a fraction of the whole, so that it would be more just to acquit this portion because of the other than to condemn the other because of it.

Further, it is clear that we will also say in response to these people what we said before;[169] for it must be proved to them, and they must be persuaded, that there is a certain nature that is immovable. And indeed to say that things at the same time are and are not is to imply that all of them are at rest rather than that they are moving; for there is nothing for things to change into; for everything belongs to everything.

But in the case of truth, [it must be proved] that not everything that appears is **1010^{b}1** true. First, even if perception—at any rate, of a special object[170]—is not false, still imagination is not the same thing as perception. Again, it is fair to wonder if our respondents are really puzzled as to the following: whether magnitudes and colors are such as they appear to people at a distance, or as they appear to those close at hand; or whether they are such as they appear to the healthy or such as they appear to the sick; or whether things are heavier if they appear so to weak people or if they appear so to strong ones; or whether things are true if they appear so to those asleep or to those awake. For that the people involved do not think so, at least, is evident. At any rate, no one who is in Libya and [while asleep] one night supposes himself to be in Athens lots off for the Odeon [when he wakes up]. Further, about the future, as Plato too says,[171] the belief of a doctor and that of an ignorant person are surely not equally in control [of the truth]—for example, about whether someone is going to become healthy or not going to.

Further, among perceptual modalities themselves there is not the same degree of control in the case of the object of a capacity other than itself as in that of its special object, nor in the case of a neighboring object as in that of its own, but in the case of color it is sight that has control, not taste, and where flavor, it is taste that has it, not sight. And each of these never says in the same time frame about the same thing that it is so-and-so and not so-and-so at the same time. Nor even when different time frames are involved was there dispute about the affection, but about the thing with which the affection coincided. I mean, for example, that the same wine might, if either it changed or the body of the perceiver changed, seem at one time sweet and at another time not sweet. However, the sweet, the sort of thing it is when it is present, has in no way changed; rather, the perceptual modality always grasps the truth about it, and whatever is to be sweet is of necessity of this sort. And yet all these arguments do away with this, and just as there is no substance of anything, so nothing is of necessity either; for what is necessary cannot possibly be in one state and another, so that if anything is of necessity, it will not be both so-and-so and not so-and-so.

169. $1009^{a}36–38$.
170. *DA* $418^{a}11–16$. Cf. *Sens*. $447^{a}15–20$, $449^{a}21–24$.
171. *Theaetetus* 171e, 178b–179a.

And, in general, if indeed only the perceptible exists, nothing would exist unless animate beings existed; for there would be no perception. That neither perceptibles nor perceptual affections would exist is presumably true (for they are ways of the perceiver's being affected), but that the underlying subjects that produce perception would not exist even without perception is impossible. For perception is certainly not perception of itself, but there is also some other thing beyond the perception, which is necessarily prior to the perception; for what moves something is prior in nature to what is moved, and even if they are said to *be* with reference to each other, this is no less so.

4.6
Discussion Continued

There are some people who are puzzled, however, both among those who are persuaded by all this and among those who merely give these arguments; for they are inquiring about who will judge the person of sound mind and in general, concerning each thing, judge it correctly. But puzzles of this sort are like being puzzled about whether we are asleep now or awake, and all such puzzles amount to the same thing; for those who pose them demand an argument for everything; for they are looking for a starting-point, and to get hold of it through demonstration, since that they, at any rate, are not persuaded is evident in their actions. But precisely as we said,[172] this is how they are affected; for they are looking for an argument for things for which there is no argument; for the starting-point of demonstration is not a demonstration.

These people, then, might be easily persuaded of this (for it is not difficult to grasp). But those who are looking to find in argument alone the force [that will persuade them] are looking for the impossible; for they demand to state things that are contrary, and at once are stating contrary things.[173]

If, however, not everything is relative to something, but some things also are intrinsically [what they are], not everything that appears will be true; for what appears, appears to someone, so that the person who says that everything that appears is true makes all the beings relative to something. That is why those who are looking to find in argument the force [that will persuade them], and who at the same time also demand to subject themselves to argument, must guard themselves and say that it is not what appears that is true but what appears to the one to whom it appears, when it appears, to the perceptual modality to which it appears, and the way it appears. If they subject themselves to argument, however, but not on these terms, they will quickly find themselves stating contrary things. For it is possible for the same thing to appear to be honey to sight but not to taste and—since we have two eyes—for things not to

172. 1006a5–11.

173. I.e., the things they assert are the contraries of the starting-points of the demonstrations they are demanding.

appear the same to the sight of each, if the two sights are dissimilar. For to those who, due to the causes mentioned previously, say that what appears is true, and that that is why all things are alike false and true (for the same things do not appear the same to everyone), or even always the same to the same person, but often things have contrary appearances at the same time (for touch says there are two things when the fingers are crossed, while sight says there is one)—to these we will say, "but not, at any rate, to the same perceptual modality and in the same part of it and in the same way and in the same time frame," so that this would be true. And presumably that is why those who state these things not because they are puzzled, but for the sake of argument must say that this is not true, but true for this person. As was said previously, then, they must make everything relative to something, that is, to belief and perception, so that nothing either has come to be or will be without someone first having a belief about it. But if something has come to be or will be [without anyone's having a belief about it], it is clear that not everything can be relative to belief.

Further, if a thing is one, it is one relative to one thing or to something definite; and if the same thing is both half and equal, still it is not to the double, at any rate, that the equal is relative. If, then, relative to a believer the same thing is human and the object of belief, it is not the believer who will be human but the object of belief. And if each thing is to be relative to a believer, a believer will be relative to things that are unlimited in form.

About the fact that the most stable belief of all is that opposite affirmations are not true at the same time, what the consequences are for those who say that they are, and why it is that they say this, let this much suffice. But since it is impossible for contradictories to be true of the same thing at the same time, it is evident that contraries cannot belong to the same thing at the same time either; for one of a pair of contraries is a privation no less [than a contrary], or a privation of substance, and a privation is the denial [of something] to some definite kind. So, if it is impossible at the same time to affirm and to deny truly, it is also impossible for contraries to belong at the same time, unless either both belong in a certain way or one in a certain way and the other unconditionally.

4.7
The Principle of Excluded Middle

But then neither is it possible for there to be anything in the middle between contradictories, but it is necessary either to affirm or to deny one thing, whatever it may be, of one thing. This will be clear if we first define what truth is and what falsehood is. For to say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, or of what is not that it is not, is true. So he who says of anything that it is, or that it is not, will say either what is true or what is false. But it is said that neither what is nor what is not either is not or is.

Further, what is in the middle between the contradictories will be so either in the way in which gray is between black and white or in the way in which what is neither a human nor a horse is between the two. But if it is in the latter way, what is in the middle could not change [into either of the extremes] (for a thing changes from not good to good or from good to not good), but in fact it manifestly always does do this (for there is no change except to opposites or things in the middle). But if it is in the middle [in the former way], in this way too there would be some sort of coming to be that is a change to white but not a change from not white. In fact, though, this is never seen.

Further, every object of thought and every intelligible object is one that thought either affirms or denies—this is clear from the definition—whenever it says what is true or says what is false. Whenever it combines things this way by affirmation or negation, it says what is true; whenever this other way, it says what is false.

Further, there must be a middle beyond all contradictories, if it[174] is not being stated for the sake of argument. And so someone could neither state the truth nor not state the truth, and there will be something between what is and what is not; and so there will also be a sort of change between coming to be and passing away.[175]

Further, in those kinds in which the negation implies the contrary, even in those there will be a middle—for example, in numbers there will be a number that is neither odd nor not odd; but that is impossible, as is clear from the definition.[176]

Further, the process will go on without limit, and the beings will be not half as many again but even more. For it will be possible to deny this in turn as regards its affirmation and its negation, and this will be a [new] thing; for its substance is something else.

Further, when someone, on being asked whether something is white, says that it is not, he has denied nothing other than that it is [white], but that it is not [white] is the negation.

Some people, however, have come to this belief in the way they have to other unacceptable ones: when they are unable to solve fallacious arguments, they give in to the argument and accept that the conclusion is true. But while some say what they say due to this cause, others do so because of looking for an argument for everything. The starting-point in response to all these people, however, is from a definition. But the definition is based on the necessity that they themselves signify something; for the account of which the name [they use] is a signifier will be a definition.

It seems, though, that while Heraclitus' argument, which says that everything is and is not, makes everything true, that of Anaxagoras, that there is something in the middle of contradictories, makes everything false; for when things are mixed, the mixture is neither good nor not good, so that there is nothing true to say.

174. The denial of excluded middle.
175. Which is impossible.
176. $1012^{a}4$–5.

4.8
Nothing Is True and Everything Is True

Given these distinctions, it is evident that the one-sided things that some people say, and say about everything, cannot hold good—some saying that nothing is true (for there is, they say, nothing to prevent everything from being like the commensurability of the diagonal), others that everything is true; for these statements are pretty much the same as that of Heraclitus. For anyone who states that everything is true and that everything is false also makes each of these statements separately, so that if indeed each is impossible, the combination of the two is also impossible. **1012^{b}1**

Further, there are manifest contradictories that cannot be true at the same time—and cannot, then, all be false either—and yet this might seem, from what has been said, to be more possible.

Against all such statements, however, what should be asked for (as was also said[177] in the arguments given above) is not that something be or not be, but that something signify something, so that one must argue dialectically from a definition, that is, by assuming what falsity and truth signify. And if what it is true to affirm is nothing other than what it is false to deny, it is impossible for everything to be false; for of a contradiction one part must be true.

Further, if it is necessary that everything be either affirmed or denied, it is impossible for both to be false; for it is one part of the contradiction that is false. Indeed, the often expressed objection to all such statements clearly follows, that they do away with themselves.[178] For anyone who says that everything is true also makes the contrary of his own statement true, so that his own is not true (for the contrary statement denies that it is true), while anyone who says that everything is false makes his own statement so as well. But if each makes an exception of these cases, the former saying that the contrary of his statement is alone not true, the latter that his own is alone not false, it follows nonetheless that each must assume an unlimited number of statements to be true or false; for the statement that says that the true statement is true is true, and this will go on without limit.

It is evident that neither those who say that all things are at rest nor those who say that all things are moving speak truly. For if all things are at rest, the same things will always be true and the same ones always false, but it is evident that this changes (for the speaker himself at one time was not and will not be again). And if all things are moving, nothing will be true. Therefore, everything will be false. But it has been proved that this is impossible. Further, it is necessary that what is changes; for change is from something to something. But then it is not the case that all things are at rest or moving sometimes, and nothing always; for there is something that always moves the things that are moving, and the primary mover is itself immovable.

BOOK 5 (DELTA)

5.1
Starting-Point

Something is said to be a starting-point if it is: The point in a thing from which one would move first—for example, of a line or of a road there is this starting-point from here, and another from the contrary direction. That from which each thing would best come to be—for example, even in learning one must sometimes begin not from what is primary (that is, the starting-point of the thing), but from the point from which it is easiest to learn. The component from which a thing first comes to be—for example, as of a ship the keel does and of a house the foundation, while of animals some suppose that the heart does,[179] some the brain,[180] and others some other such thing. The non-component from which a thing first comes to be, from which movement and change naturally first begin—for example, a child comes to be from its father and mother, and a fight from abusive language. That in accord with whose deliberate choice what is moved is moved and what is changed is changed—for example, the rulers in cities, dynasties, and kingships are said to be *archai*,[181] as are crafts, especially architectonic ones. Further, that from which a thing can first be known is also said to be a starting-point of the thing—for example, the hypotheses are the starting-points of demonstrations.

Things are also said to be causes in the same number of ways; for all causes are starting-points.[182]

It is common, then, to all starting-points to be the first thing from which something is, or comes to be, or is known; but of these some are components, others external. That is why the nature of a thing is a starting-point, as is the element of a thing, and also thought and deliberate choice, and the substance and the for-the-sake-of-which; for of many things the starting-point both of knowledge and of movement is the good and the noble.[183]

5.2[184]
Cause

Something is said to be a cause if it is: The component from which a thing comes to be—for example, the bronze of a statue or the silver of a bowl, also the kinds of these. The form and paradigm, and this is the account of the essence, and kinds of

179. *GA* 735ᵃ12–26, 740ᵃ17–19.
180. Plato, *Timaeus* 44d.
181. *Archê* also means "ruler."
182. Cf. *GC* 324ᵃ27–28.
183. 1078ᵃ31–32.
184. Cf. *Ph.* 194ᵇ23–195ᵇ21.

this (for example, of the octave, the ratio 2:1 and number in general), and the parts included in the account. Further, that from which the change or rest from change first starts—for example, the person who has deliberated is cause [of the action], the father of his child, and in general, the producer is cause of the thing being produced and the change-maker of the change. Further, the end, and this is the for-the-sake-of-which—for example, of taking walks health is the end. For why does he take walks? "In order that he may be healthy," we say. And in speaking that way we think we have presented the cause. Also, anything, then, that comes to be as an intermediate [means] to the end, when someone else has started the movement—for example, in the case of health, slimming, purging, drugs, or instruments; for all these are for the sake of the end, although they differ from each other in that some are instruments and others works.

These, then, are pretty much all the ways in which things are said to be causes, and because they are said to be such in many ways it follows both that there are many causes of the same thing, and not coincidentally (as, for example, a statue has both the craft of sculpture and the bronze as causes—not with reference to another thing but insofar as it is a statue—although not in the same way, but the one as matter and the other as that from which the movement derives), and that things can be causes of each other (as, for example, exercise [is a cause] of good physical condition and the latter of exercise, although not in the same way, but the one as end and the other as the starting-point of movement). Further, the same thing can be the cause of contraries; for the thing that, when present, is cause of so-and-so, we sometimes hold causally responsible, when absent, for the contrary result—for example, the cause of a shipwreck is the absence of the captain whose presence was a cause of its preservation. Both things, presence and privation, are causes in the way movers are.

All the causes now mentioned fall into four most evident ways [of being causes]. For phonetic elements are causes of syllables, matter of artifacts, fire, earth, and all such things of bodies, the parts of the whole, and the hypotheses of the conclusion, as being causes from which [the things come]. And of these some are causes as underlying subject (for example, the parts), some as the essence (for example, the whole, the mode of composition, and the form). And the seed, the doctor, the deliberator, and in general, the producer are all starting-points from which comes change or rest. The remainder are causes as the end and the good of other things; for what other things are for the sake of tends to be the best for them and their end. Let us assume that it makes no difference whether one says "good" or "apparent good."

These, then, are the causes and this is the number of their forms, but the ways of being causes, though many in number, also come under comparatively few headings. For things are said to be causes in many ways, even within the same form, as being prior or posterior to each other—for example, [as a cause] of health, the doctor and the craftsman; of the octave, the double and number; and in every case, whatever includes any of the particular causes.

Further, there are coincidental causes and their kinds—for example, [as a cause of] a statue, in one way Polyclitus, in another a sculptor, because the sculptor coincides with Polyclitus, and, as examples of what includes the coincidental cause, a human is a cause of the statue, or, in general, an animal, because Polyclitus is human and a human is an animal. And among coincidental causes some are more remote than others, some less remote—for example, if the pale and the musical were said to be causes of the statue, but not Polyclitus or a human only.

Beyond all the things said to be causes either properly or coincidentally, however, some are said to be so potentially, others actively—for example, [as a cause of] the house's being built, a builder, on the one hand, and a builder building, on the other.

Similarly, the things that causes are causes of will also be said to be in the ways mentioned—for example, this statue, a statue, or, in general, a likeness; this bronze, bronze, or, in general, matter; and similarly in the case of coincidental [effects].

Further, both the former [proper] and the latter [coincidental] may be said to be causes in combination—for example, not Polyclitus or sculptor but Polyclitus the sculptor.

But still all of these things are just six in number, each said to be in two ways: either as the particular, as the kind, as the coincidental, or as the kind of the coincidental is, or as these are either as combined or as simply said to be, and all of them either as actualities or potentially. But they differ to the extent that what is actual and what is particular exists, or does not exist, at the same time as the things it causes—for example, this person curing at the same time as this one recovering his health, this builder building with this building being built. But this is not always the case with what are potentially causes; for the house does not pass away at the same time as the builder.

5.3
Element

Something is said to be an element if: It is the primary component from which a thing is composed, and indivisible in form into a distinct form—for example, the elements of a voiced sound are the things from which the voiced sound is composed and the ultimate things into which it is divided, these being no longer divided into voiced sounds distinct in form from them, but rather, if they are divided, their parts are of the same form—for example, a part of water is water (but a part of a syllable is not a syllable). Similarly, those who speak of the elements of bodies mean the ultimate things into which bodies are divided, while they are no longer divided into other things differing in form; and whether the things of this sort are one or more than one, they call these "elements."

In much the same way, things are also said to be the elements of diagrams and, in general, of demonstrations; for the demonstrations that are primary and are components of more than one other demonstration are said to be elements of

demonstrations; and of this sort are the primary deductions consisting of three **1014^{b}1**
terms proceeding through one middle.

By metaphorical transference from this case people also call something an "element" when, being one and small, it is useful for many things. That is why what is small, simple, and indivisible is said to be an element. From which it comes about 5
that most universal things are elements (because each of them, being one and simple, belongs to many things, either to all or to most) and that one and point are thought by some to be starting-points. Since, then, the so-called kinds are universal and indivisible (for there is no account of them), some say that the kinds are elements, 10
and more so than the difference, because the kind is more universal—for where the difference belongs, the kind too follows along with it, but where the kind belongs, the difference does not always do so.

Common to all the cases, however, is that the element of each thing is the primary component in each. 15

5.4[185]
Nature

What is said to be nature (*phusis*) is: In one way, the coming to be of things that grow, as if one were to pronounce the *u* long;[186] in another way, the first component from which a growing thing grows. Further, that from which the first movement that is present in each of the beings that are by nature belongs to it itself insofar as it is itself. Those things are said to grow that get their increase in size through another thing by 20
making contact and growing together or by adhesion, as in the case of embryos. But growing together differs from contact; for in the case of contact it is not necessary that any other thing exist besides the contact, while in the case of things that grow together there is some one thing, the same in both, which makes them grow together instead of [merely] making contact, and makes them one as regards continuity and 25
quantity, although not as regards quality.

Further, that first thing from which any being that is by nature is or comes to be, and which is unshaped and cannot be changed from the capacity that belongs to it, is said to be its nature—for example, bronze is said to be the nature of a statue and of bronze artifacts, wood of wooden ones, and similarly in the case of others; 30
for each thing is made from these, when the primary matter is preserved; for it is in this way that the elements of the beings that are by nature are also said to be their nature, some saying that it is fire, some earth, some air, some water, and others some or all of these.

185. Cf. *Ph*. 2.1.
186. *Phuesthai* ("grow") has a long *u* in most of its forms, whereas *phusis* has a short *u*.

Further, in another way the substance of the beings that are by nature is said to be their nature—as, for example, with those who say that the nature is the primary mode of composition, or as Empedocles says:

> There is no nature at all of any mortal things,
> But rather there is only mixing and separating of things
> Mixed, but "nature" is the name bestowed on them by men.[187]

That is why, as regards the things that are or come to be by nature, although that which they naturally come to be or are is already present, we still do not say that they have their nature if they do not have the form and the shape. What is by nature, then, is what is composed of both of these—for example, animals and their parts. But nature is both the primary matter—and this in two ways, either primary relative to the thing itself or primary in general (for example, in works of bronze the bronze is primary relative to themselves, but perhaps water is primary in general, if all meltable things are water)—and the form and the substance, which is the end of their coming to be.

By metaphorical transference from this case every substance, in general, is said to be nature, because the nature of a thing is a sort of substance.

From what has been said, then, the primary nature, in the strict sense, is the substance of things that have a starting-point of movement within themselves, insofar as they are themselves; for the matter is said to be nature because it is receptive of this, and comings to be and growing because they are movements arising from it. And the starting-point of change for the beings that are by nature is this, since it is in some way a component of them, either potentially or actually.

5.5
Necessary

Something is said to be necessary: If it is that without which, as a contributing cause, living is impossible—for example, breathing and nourishment are necessary for an animal, for it cannot exist without these. Also, if it is anything without which it is not possible for the good to be or come to be, or for the bad to be got rid of or taken away—for example, drinking the medicine is necessary in order not to be sick, as is sailing to Aegina in order to get the money. Further, if it is forced or is force (that is, what impedes and tends to hinder, contrary to impulse or deliberate choice), for what is forced is said to be necessary, which is why it is also painful (as Evenus says, "for every necessary thing has a troublesome nature"[188]) and force is a sort of necessity (as

187. B8 DK.
188. F8 West.

Sophocles says, "but force necessitates that I do this"[189]). And it seems that necessity is something that cannot be persuaded, and correctly so; for it is contrary to the movement that is in accord with deliberate choice and in accord with rational calculation.

Further, when it is not possible for something to be otherwise, we say that it is necessary to be as it is. And it is in accord with this sort of necessity that all the others are in some way said to be necessary; for what is forced is said to be necessary either to do or to suffer, when it is not possible to follow impulse because of what is doing the **1015b1** forcing—implying that necessity is that because of which it is not possible for a thing to be otherwise. And similarly in the case of the contributing causes of living and the good; for when, in the one case, the good, and in the other case, living and being, are not possible without certain things, those things are necessary and that cause is a sort of necessity. Further, demonstration is among the things that are necessary, because it is not possible for something to be otherwise if it has been demonstrated unconditionally. The cause of this is the primary things, if the things from which deduction proceeds cannot be otherwise.

Of some things, then, another thing is the cause of their being necessary, of others nothing is such a cause, rather, because of them other things are necessary. So the necessary in the primary and strict sense is the simple; for it is not possible that this should be in more than one state, or even for it to be both in one state and in another; for it would thereby be in more than one state. Therefore, if there are certain things that are eternal and immovable, there is nothing forced or contrary to nature in them.

5.6
One

Things are said to be one either coincidentally or intrinsically: Coincidentally—for example, "Coriscus and the musical" and "musical Coriscus" (for it is the same thing to say "Coriscus and the musical are one" and "musical Coriscus"), "the musical and the just" and "musical and just Coriscus"; for all these are said to be one coincidentally: the just and the musical, because they coincide with one substance, the musical and Coriscus, because one coincides with the other. Similarly, the musical Coriscus is in a way one with Coriscus, because one of the parts in the account coincides with the other—for example, the musical with Coriscus. And musical Coriscus is in a way one with just Coriscus, because a part of each coincides with one and the same thing. The case is similar if the coincident is said of the kind or of the names of something universal—for example, that a human and a musical human are [one and] the same; for it is either because the musical coincides with the human who is one substance or because each of the two coincides with some particular thing—for

189. *Electra* 256.

example, Coriscus. Except they do not both belong to him in the same way, but human presumably does so as kind and included in the substance, while musical does so as a state or affection of the substance. Things that are said to be one coincidentally, then, are said to be so in this way.

Among things said to be one intrinsically, some are said to be so because they are continuous—for example, a bundle [is one] because of being tied together, and pieces of wood, because of being glued together. And a line, even if bent, is said to be one if it is continuous, as is each part—for example, a leg or an arm. Among these themselves, the continuous by nature are more one than the continuous by craft. A thing is said to be continuous when its movement is intrinsically one and cannot be otherwise, and a movement is one when it is indivisible, and indivisible with respect to time. And things are intrinsically continuous when they are one but not by contact; for if you place pieces of wood so that they make contact with each other, you will not say that these are one piece of wood, or one body, or one whatever else is continuous. Continuous things, in general, are said to be one, then, even if they admit of being bent, but still more so those that do not admit of being bent—for example, the shin or the thigh more than the leg, because it is possible for the movement of the leg not to be one [movement]. Also, a straight line is more one than a bent line. But that which is bent and has an angle we say is both one and not one, because it is possible for its movement to be either not all at once or all at once, while that of a straight line is always all at once, and no part of it having magnitude is at rest while another such part moves, as with a bent line.

Further, a thing is said to be one in another way when its underlying subject is undifferentiated in form, and it is undifferentiated when its form is perceptually indivisible. The relevant underlying subject, however, is either the first or the last relative to the end; for in fact wine is said to be one and water is said to be one, insofar as they are indivisible in form, while juices (for example, oils and wine) and meltable things are all said to be one because the ultimate underlying subject of all of them is the same—for all of these are water or air.

Things are also said to be one whose kind is one, although distinguished by opposite differences. And all these are said to be one because the kind that is the underlying subject of their differences is one (for example, horse, human, and dog are one something, because all are animals), and in much the same way, indeed, as cases in which the matter is one. These are sometimes said to be one in this way, and sometimes it is the higher kind that is said to be the same, if they are the ultimate forms of their kind, the ones higher than these. For example, the isosceles and the equilateral are one and the same figure because both are triangles, although they are not the same sorts of triangle.

Further, things are said to be one when the account that states the essence of one is indivisible from another that indicates the other (for every account is intrinsically

divisible).[190] For in this way too what has increased in size and is diminishing in size is one, because its account is one, as is that of their form in the case of plane figures. And, in general, when the understanding that understands the essence of certain things is indivisible, and cannot separate them in time or place or account, these things are most of all one, and of these, those that are substances are most of all one; for those things that do not admit of division, insofar as they do not admit of it, are universally said to be one—for example, if insofar as something is a human it does not admit of division, it is one human, if insofar as it is an animal, one animal, if insofar as it is a magnitude, one magnitude.

Most things are said to be one because of acting on, having, being acted on, or being related to some other thing that is one, while the things that are said to be one in the primary way are those of which the substance is one—and one either in continuity or in form or in account; for in fact we count as more than one either things that are not continuous, or those whose form is not one, or those whose account is not one.

Further, while in a way we say that anything is one if it is a quantity and continuous, in another way we do not say so if it is not some sort of whole, that is, if the form it possesses is not one. For example, if we saw the parts of a shoe randomly put together, we would not say that it was one in a similar way (unless we did so because of its continuity), but only if they were put together in such a way as to be a shoe, that is, so as to already possess some form that is one. That is why of all lines the circle is to the highest degree one, because it is whole and complete.

To be one, however, is to be[191] a sort of starting-point of number;[192] for the first measure is a starting-point; for that by which we first know it is the first measure of each kind. The starting-point, then, of what is knowable about each kind is what is one. But what is one is not the same thing in all kinds. For here it is a quarter-tone, there a vowel or consonant, another thing in the case of weight, and something else in that of movement. In every case, however, what is one is indivisible either in quantity or in form. What is indivisible in quantity, when it is indivisible in all dimensions and lacks position, is said to be a unit, and when it is indivisible in all dimensions and has position, a point. What is divisible in quantity in one dimension is a line, in two a plane, in all—that is, in three—a body. And, reversing the order, what is divisible in two dimensions is a plane, in one dimension a line, and what is in no dimension divisible in quantity is a point or unit; what lacks position is a unit and what has position a point.

190. An account A_1 that states the essence of something indicates it. For A_1 to be divisible from an account A_2 that indicates the same thing, A_1 and A_2 would have to separate that thing from itself in time, place, or account (1016^b1–3). But this is impossible. So A_1 and A_2 must be (or be variants of) the same account (1052^a29–34).

191. Rejecting the addition of τοῦ.

192. 1052^b15–1053^b8.

Further, some things are one in number, others in form, others in kind, others by analogy: in number, those whose matter is one; in form, those whose account is one; in kind, those whose figure of predication[193] is the same; by analogy, those related as another thing is to another thing. And the latter sorts always follow along with the earlier ones—for example, those that are one in number are also one in form, while those that are one in form are not all one in number; but those that are one in form are also one in kind, while those that are one in kind are not all one in form, but are all one by analogy; but those that are one by analogy are not all one in kind.

Also, it is evident that things will be said to be many in ways opposite to those in which they are said to be one; for some things will be many because they are not continuous, others because their matter, whether primary or ultimate, is divisible in form, others because the accounts that state their essences are more than one.

5.7
Be

Something is said to *be*, on the one hand, coincidentally and, on the other, intrinsically: Coincidentally—for example, we say that the just person *is* musical, that the human *is* musical, and that the musical *is* human, and this is much the same as saying that the musical builds, because the builder happens to be musical or the musical happens to be a builder (for here "this is this" signifies this coincides with this). And so it is in the cases mentioned; for when we say that the human is musical and the musical is human, or that the pale is musical or the musical is pale, in the last two it is because both affections coincide with the same thing, and in the first[194] because the affection coincides with the thing that is a being, while the musical is human because the musical coincides with a human (it is in this way too that the not-pale is said to *be*, because what it coincides with is a being). Things that are said to *be* coincidentally, then, are said to *be* in this way, either because both belong to the same thing that is a being, because that to which one belongs is a being, or because the thing itself, to which belongs that thing of which it itself is predicated, is a being.[195]

The things said to *be* intrinsically are the very ones signified by the figures of predication;[196] for the ways in which things are said [to *be*] are the ways in which being signifies. So since of things predicated of a thing some signify what-it-is, some a quality, some a quantity, some a relative, some an acting on or a being acted on, some a where, some a when, being signifies the same thing as each of these; for there is no difference between a human *is* keeping healthy and a human keeps healthy, nor

193. I.e., those in the same category.
194. I.e., the human is musical.
195. The thing itself is the human; that of which it is itself predicated is the musical, which in fact belongs to (or is an affection of) the human, which is a being.
196. I.e., the categories.

between a human *is* walking or cutting and a human walks or cuts, and similarly in the other cases.

Further, being (*to einai*) or is (*to estin*) signify that something is true, and is not signifies that it is not true, but rather a falsehood—similarly, in the case of affirmation and negation. For example, it *is* the case that Socrates is musical signifies that this is true, it *is* the case that Socrates is not pale, that this is true; while it *is not* the case that the diagonal is commensurable signifies that this is false.

Further, is (*to einai*) and being (*to on*) signify the things mentioned, on the one hand, potentially and, on the other, actually. For we say both of what potentially sees **1017**^{b}**1** and of what actually sees that it *is* a seeing thing, and, in the same way, both of what is capable of using its scientific knowledge and of what is using it that *is* a scientifically knowing one, and both of what rest already belongs to and of what is potentially resting that it *is* a resting thing. It is the same way in the case of substances; for in fact we say of Hermes that he *is* in the stone, and of the half-line that it *is* [in the line], and of what is not yet ripe that it *is* wheat. But when something is potential and when it is not yet potential must be determined elsewhere.[197]

5.8[198]
Substance

Said to be substances are: The simple bodies (for example, earth, fire, water, and everything of this sort), bodies in general, the things composed of them, both animals and daimonic beings, and the parts of these. Each of these is said to be a substance because it is not said of an underlying subject, but rather the other things are said of it. And in another way, any component that is the cause of being in such things as are not said of an underlying subject—for example, the soul in the case of an animal. Further, those component parts of such things that define them and signify a this something and whose destruction destroys the whole—as, for example, the plane's does to the body, as some people say,[199] and the line's does to the plane; and in general, number seems to be a thing of this sort to some people (for they think that nothing is if number is done away with, and it defines all things). Further, the essence, the account of which is a definition, is said to be each thing's substance.

It follows, then, that something is said to be substance in two ways; either it is the ultimate underlying subject that is no longer said of anything else or that which, being a this something, is also separable—and the shape and form of each thing is like this.

197. 9.7.
198. Cf. *Cat*. 5.
199. The Pythagoreans and Plato.

5.9
Same

Some things are said to be the same coincidentally—for example, the pale and the musical are the same because they coincide with the same thing, and human and musical are the same because one of them coincides with the other, and the musical is human because it coincides with the human. And the musical human is the same as each of the other two and each of them as it; for both the human and the musical are in fact said to be the same as the musical human, and he the same as they. That is also why all these are not said universally; for it is not true to say that every man is the same as the musical; for the universals belong intrinsically, while the coincidents do not belong intrinsically.[200] But in the case of particulars they are said of them unconditionally; for Socrates and musical Socrates seem to be the same. But Socrates is not said of more than one thing, which is why we do not say "every Socrates" as we say "every human."

Some things, then, are said to be the same in this way. Others are said to be the same intrinsically, and in as many ways as things are said to be one; for in fact things whose matter is one, either in form or in number, are said to be the same, as are things whose form is one, so that it is evident that sameness is a sort of oneness of the being either of more than one thing or of one thing when it is treated as more than one—for example, when one says that a thing is the same as itself, which is to treat it as two things.

Things are said to be distinct [or other] when either their forms, their matter, or the account of their substance are more than one. And, in general, things are said to be distinct in ways opposite to those in which they are said to be the same.

Those things are said to be different which are distinct, though they are the same something—not only in number but either in form, in kind, or by analogy. Further, those that are distinct in kind; and contraries; and those that have distinctness in their substance.

Things are said to be similar[201] whose affections are the same in every respect, and those more of whose affections are the same than other, and those whose quality is one. Also, what shares with something else a majority of those contraries with respect to which alteration[202] is possible, or those with more control,[203] is similar to that thing.

Things are dissimilar in ways opposite to those in which they are similar.

---

200. If every human were musical, musical would belong universally to humans, and thus would belong intrinsically rather than coincidentally to them, so that no human would be coincidentally musical.

201. $1054^{b}3$–13.

202. *Ph*. $245^{b}3$–5, *GC* $319^{b}10$–12.

203. Over our perception of similarity.

5.10[204]
Opposites

Things said to be opposites include contradictories, contraries, relatives, privation and having, and the extremes that comings to be and passings away are from and to. And all things that cannot be present at the same time in what is receptive of both are said to be opposed—either themselves or their components. For gray and white do not belong at the same time to the same thing, because their components are opposed.

Said to be contraries are: Those things differing in kind that cannot belong to the same thing at the same time.[205] The most different of the things in the same kind.[206] The most different of the things in the same recipient.[207] The most different of the things falling under the same capacity. The things whose difference is greatest either unconditionally, in kind, or in form. Other things are said to be contraries, either because of having ones of the same sorts as these, because of being receptive of them, being productive of them, capable of being affected by them, because of in fact producing or being affected by them, or because of being losses or acquisitions, or havings or privations, of them.

But since things are said to be one and said to *be* in many ways, the others that are said to *be* in accord with these must also follow along with them, so that same, other, and contrary must be distinct in each category.

Things said to be distinct [or other] in form[208] are those that are of the same kind but not subordinate to each other, any things that, being in the same kind, have some **1018b1** difference, and any things that have contrariety in their substance. Also, contraries are distinct in form, either all of them or those said to be such in the primary way. Also, those things whose accounts are distinct in the ultimate forms of their kind—for example, human and horse are indivisible in kind, while their accounts are other [in this way]; also, any things that, being in the same substance, have a difference.[209]

5.11[210]
Prior and Posterior

Among things said to be prior and posterior, some are so said on the supposition that there is a first and a starting-point in each kind, because they are closer to a certain starting-point defined either unconditionally and by nature, or with reference

204. Cf. *Cat*. 10.
205. *Cat*. 14a22–23.
206. 1055b13–17.
207. *Somn*. 453b27–31.
208. 10.8–9.
209. 1058a6–8.
210. Cf. *Cat*. 12.

to something or somewhere or by certain people. For example, things are prior in place by being closer to some place defined either by nature (for example, the middle or the last place) or with reference to something random; and what is further away is posterior. Others things are prior in time, some by being further from now, as in the case of things that have come to be (for the Trojan wars are prior to the Persian because they are further from now), some by being closer to now, as in the case of things that are to come (for the Nemean Games are prior to the Pythian because they are closer to now, treating now as starting-point and first). Others are prior in movement (for what is closer to the first mover is prior—for example, the boy is prior to the man; and the first mover too is unconditionally a sort of starting-point). Others are prior in capacity (for what is superior in capacity, that is, what is more capable, is prior). Of this sort is, in deliberate choice, the thing that it is necessary for another thing—the posterior one—to follow, so that if the former does not move it, the latter is not moved, and if the former moves it, the latter is moved, and the deliberate choice is a starting-point. Others are prior in order, when there is some one definite thing relative to which things are arranged at intervals in accord with some account—for example, in a chorus the second person is prior to the third, and in the lyre the next-to-bottom string to the bottom one; for in the one case, the chorus leader and, in the other case, the middle string is the starting-point. These things, then, are said to be prior in this way.

But in another way what is prior in knowledge is treated as also unconditionally prior. Among these things, the prior in account are distinct from the prior in perception. For universals are prior in account, while particulars are prior in perception. Also, in account the coincident is prior to the whole—for example, the musical is prior to the musical human; for without the part the account will not be whole. And yet it is not possible to be musical without being a musical something.

Further, the affections of what is prior are said to be prior—for example, straightness to smoothness. For the first is an intrinsic affection of line, and the second of surface. Some things, then, are said to be prior and posterior in this way.

Others, however, are said to be so in nature and substance, when it is possible for them to be without other things, but not the others without them—a distinction used by Plato.[211] But since there are many ways of being, first, the underlying subject is prior, which is why the substance is prior. Second, the potential cases are distinct from the actual ones; for some things are potentially prior, others actually so—for example, potentially, the half-line is prior to the whole, and the part to the whole, and the matter to the substance, while actually, they are posterior; for it is [only] when the whole has been dissolved that the part will actually be.

In a way, then, all the things that are said to be prior and posterior are said to be such with reference to these; for it is possible for some things to be without others

211. Reference unclear.

with respect to coming to be—for example, the whole can be without the parts [with respect to the coming to be of the whole]; while for others it is possible with respect to passing away—for example, the part can be without the whole [with respect to the passing away of the whole]. It is the same way in the other cases too.

5.12[212]
Capacity, Potentiality, Power

Something is said to be a capacity, [potentiality, or power] when it is a starting-point of movement or change either in another thing or in a thing insofar as it is other—for example, the craft of building is a capacity that is not a component of the thing being built, while the craft of making healthy, which is a capacity, might be a component of the thing being made healthy, but not of it insofar as it is being made healthy.[213] The starting-point of change or movement is said to be a capacity in this way, then, when the change or movement is in another thing or in a thing insofar as it is other, but also when it is caused by another thing or by a thing insofar as it is other. For it is in virtue of the starting-point, in virtue of which the thing that is affected is affected, that we say it has the capacity to be affected, sometimes when it is affected in any way at all, sometimes not in virtue of every affection, but when it is for the better.

Further, there is the capacity to accomplish the thing in question well or in accord with deliberate choice; for of those who merely walk or speak, but not well or not as they deliberately choose, we sometimes say that they are not capable of speaking or walking. It is the same way in the case of being affected.

Further, the states in virtue of which something is wholly unaffectable or unchangeable or not easily moved for the worse are said to be capacities; for things get broken, crushed, bent, and in general, pass away not by being capable but by being not capable and deficient in something. And they are unaffectable in these ways if they are scarcely or slightly affected because of a capacity they have and by being capable and being in some state.

Since things are said to be capacities in these many ways, so too what is said to be capable is in one way what has a starting-point of movement or change (for even what can bring things to rest is capable in a way) in another thing, or in a thing insofar as it is other. And in another way if something else has a capacity of this sort with regard to it. And in another way if it has the capacity to change into something, **1019^{b}1** whether for the worse or the better (for even what passes away seems to be capable of passing away, since it would not have passed away if it were incapable of it; but, as things stand, it has a certain disposition, cause, or starting-point to be affected in this way). Sometimes, indeed, it seems that way by having something, sometimes by

212. Cf. 9.1.
213. *Ph.* 192^{b}21–27.

privation of something. But if a privation is in a way a having, everything would be something by having, so that things would be capable both from having a certain sort of state and starting-point and by having the privation of having it, if it is possible to have a privation—or, if this is not possible, things will be capable homonymously.[214] And in another way, if neither another thing nor the thing itself insofar as it is other has a capacity or a starting-point that is destructive of it. Further, all of these are said to be capable of something either merely because the thing might happen to come about or not to come about, or because it might do so well. For the latter sort of capacity is found even in inanimate things, such as instruments; for it is said that one lyre can speak, while another cannot do so at all, if it does not have a good tone.

Incapacity is privation of capacity, that is, privation of the sort of starting-point that has been described, either in general or by what naturally should have it, or even by what at the time should naturally already have it; for a boy, a man, and a eunuch would not in the same way be said to be incapable of begetting children. Further, to each of the two sorts of capacity there is an opposite incapacity—both to what can merely produce movement and to what can produce movement well.

Some things, then,[215] are also said to be incapable in virtue of this sort of incapacity, while others are in another way both capable and incapable, namely, [possible and impossible],[216] where an impossible thing is that of which the contrary is of necessity true. For example, it is impossible for the diagonal to be commensurable, because something like that is a falsehood whose contrary is not only true but also necessarily true; and it is necessary for the diagonal to be incommensurable.[217] Therefore, that it is commensurable is not only false but of necessity false. The contrary of this, the possible, is found whenever it is not necessary that the contrary is false—for example, that a human be sitting down is possible; for that he is not sitting down is not of necessity false. In one way, then, possible, as was said, signifies what is not of necessity false, in another what is true, and in another what admits of being true.

What in geometry is said to be a power is so by metaphorical transference.[218]

These things are capable [or are possible or are a power], then, not in virtue of a capacity. Those that are said to be capable in virtue of a capacity are all said to be such with reference to the primary one, that is, the starting-point of change in another
1020ᵃ1 thing or in a thing insofar as it is other. For the others are said to be capable because something else has a capacity of the relevant sort with regard to them, some because it does not have it, some because it has it in a particular way. It is the same way with things that are incapable. So that the strict definition of the primary sort of capacity

214. Reading εἰ δὲ μή, ὁμωνύμως here.
215. Reading δὴ . . . οἷον.
216. *Dunaton* means both "capable" and "possible"; *adunaton*, both "incapable" and "impossible."
217. Reading ἀλλὰ καὶ ἀνάγκη ἀληθὲς εἶναι· τὴν δὲ διάμετρον ἀνάγκη ἀσύμμετρον εἶναι.
218. As when we say that 9 is 3 to the power of 2 (3^2).

will be what is a starting-point of change in another thing or in a thing insofar as it is other.

5.13[219]
Quantity

Something is said to be a quantity when it is divisible into components each of which is naturally a one and a this something. A quantity is a plurality if it is countable, a magnitude if it is measurable. Something is said to be a plurality when it is potentially divisible into non-continuous parts, a magnitude when potentially divisible into continuous ones. Among magnitudes, those continuous in one dimension are lengths, in two, breadths, in three, depths. Among these, limited plurality is a number, limited length a line, limited breadth a surface, limited depth a body.

Further, some things are said to be quantities intrinsically, others coincidentally—for example, a line is intrinsically a certain quantity, while the musical is coincidentally a quantity.[220] Among those that are intrinsically quantities, some are so in virtue of their substance—for example, a line is a certain quantity in this way (for a certain quantity belongs to the account that says what-it-is). Others are affections and states of such substances—for example, the much and the little, long and short, broad and narrow, deep and shallow, and others of this sort. Both the great and the small and greater and smaller, either when said to be such intrinsically or in relation to each other, are intrinsic affections of quantity. However, these names are also transferred to other things.

Among things said to be quantities coincidentally, some are said to be such in the way in which it was said that the musical and the pale are quantities: in virtue of there being a certain quantity to which they belong, others in the way in which a movement and a time are; for these too are said to be certain quantities and continuous, because of the divisibility of the things of which they are affections. I mean not the thing being moved but the magnitude of its movement; for because of that's being a quantity the change too is a quantity, and the time because of it's being one.

5.14[221]
Quality

What is said in one way to be a quality is a difference in a substance. For example, human is animal qualified in a certain way because it is two-footed, horse because it is four-footed. Also, circle is shape qualified in a certain way because it is without

219. Cf. *Cat.* 6.
220. Because it can coincide with something that is of a certain quantity.
221. Cf. *Cat*. 8.

angles, because a difference with regard to substance is a quality. This, then, is one
1020b1 way in which something is said to be a quality: a difference in a substance. But there is another way, exemplified by the immovable objects and the objects of mathematics, as in the case of the numbers being of a certain quality—for example, composite ones, which are not in one dimension only, but of which the plane and the solid are imitations (these are the ones that have two or three factors). And, in general, any constituent [of a number] beyond quantity that is in its substance is a quality; for the substance of each is what it is once—for example, that of six is not what it is twice or three times but what it is once; for six is one times six.

Further, qualities include all the affections of moving substances, in virtue of which, when they change, bodies are said to alter—for example, hotness and coldness, paleness and darkness, heaviness and lightness, and the others of this sort.

Further, something is said to be a quality with reference to virtue and vice and, in general, to bad and good.

Something is said to be a quality, then, in pretty much two ways, one of which is the strictest way; for quality in the primary sense is the difference in the substance. And of this the quality in numbers is a part; for it is a sort of difference in substances, but either not of moving things or not of them insofar as they are moving. Second, there are the affections of things that move, insofar as they move, and the differences in the movements. Virtue and vice are a part of these affections; for they indicate the difference in the movement or the activity, in accord with which the things in movement act or are acted on either nobly or basely; for what can be moved or can be active in one way is good, and what can be so in another way—the contrary way—is depraved. Good and bad signify quality most of all in the case of animate things, and among these above all in the case of those that have deliberate choice.

5.15[222]
Relative

Things are said to be relative: As double relative to half and triple relative to one third, and in general, multiple relative to submultiple, and what exceeds relative to what is exceeded. As what is capable of heating relative to what is capable of being heated, what is capable of cutting relative to what is capable of being cut, and in general, what is capable of acting relative to what is capable of being acted on. As the measurable relative to the measure, the scientifically knowable to scientific knowledge, and the perceptible to perception.

The first lot are said to be relative numerically, whether unconditionally or in a definite way, and relative to themselves or to one. For example, the double is a definite number relative to one, while the multiple is in a numerical, but not a definite,

222. Cf. *Cat*. 7.

relation to one—for example, not in this or that relation to it. The relation of one-and-a-half to its reciprocal is a definite numerical relation to a number, while one-and-a-bit is related to its reciprocal by an indefinite relation, just as the multiple in relation to one. But the relation of the exceeder to the exceeded is wholly indefinite numerically; for number is always commensurable and what is non-commensurable is not said to be a number, while the exceeder is, relative to the exceeded, so-and-so much plus something more, and this is indefinite; for it can, at random, be either equal or not equal to the exceeded.

All these things, then, are said to be relative with reference to number and are affections of number. As, in a further way, are the equal, the similar, and the same (for they are all said of things with reference to one; for things are the same when their substance is one, similar, when their quality is one, and equal, when their quantity is one; and one is the starting-point and measure of number, so that all these are said of things with reference to number, although not in the same way).

Things that can act or be acted on are said to be relative with reference to a capacity to act or be acted on and the activations of the capacities. For example, what is capable of heating is relative to what is capable of being heated, because it can heat it, and in turn what is heating is relative to what is being heated, and what is cutting to what is being cut, as actively doing the things. Of numerical relations, though, there are no activations, except in the way that has been stated elsewhere,[223] but activations [that are said to be such] with reference to movement do not belong to them.

Among things that are said to be relative with reference to a capacity, some are already said be so with reference to time—for example, what has made is relative to what has been made, and what will make to what will be made. For it is in this way that a father is said to be the father of his son; for the first has acted and the second has been acted on in a certain way. Further some things are said to be relative with reference to the privation of a capacity, such as the incapable and anything else said to be [what it is] in that way—for example, the invisible.

Things that are said to be relative with reference to a number or a capacity, then, are all relative because of being said to be precisely what they are of another thing, not because of the other thing's being relative to them.

But what is measurable or scientifically knowable or thinkable is said to be relative because of another thing's being said to be [what it is] relative to them. For the thinkable signifies that there can be a thought of it, but the thought is not relative to what it is a thought of, (for then the same thing would have been said twice).[224] Similarly, sight is the sight of something, not of what it is the sight of (and yet it is of course

223. $1051^{a}29$–33, $1087^{a}10$–25.

224. A thought T is defined by its object O, so that T is by definition "the T of O." If O did not have an independent definition, it would have to be defined as "the O that T is the T of." Then T would be defined as "*the T of* the O that T is *the T of*," so that the same thing would be said twice.

1021b1 true to say this). Instead, it is relative to color or some thing of this sort. But the other way the same thing will be said twice: sight is of what sight is of.

Things that are said to be intrinsically relatives are said to be such sometimes in these ways, sometimes if their kinds are of the relevant sort—for example, medicine is included among the relatives because its kind, scientific knowledge, seems to be a relative.[225] Further, those things are said to relatives with reference to which their possessors are said to be relatives—for example, equality is a relative because the equal is, and similarity because the similar is. Other things are said to be relatives coincidentally—for example, human is a relative because double coincides with it, and double is a relative, or the pale is, if double and pale coincide in the same thing.

5.16
Complete

What is said to be complete is, in one way, that outside of which not even one part is to be found—for example, the complete time of each thing is that outside of which there is no time to be found that is part of that time. Also, that which, relative to its kind, cannot be surpassed in respect of virtue or goodness—for example, a doctor is complete and a pipe player is complete when they lack nothing as regards the form of their own proper virtue. (It is in this way, transferring the term to bad things, we speak of a complete scandalmonger and a complete thief, since we even say that they are good, for example, a good thief and a good scandalmonger.) Also, virtue is a sort of completion; for each thing is complete and every substance is complete when, as regards the form of its proper virtue, it lacks no part of its natural magnitude.

Further, things that have attained their end, this being something excellent, are said to be complete; for things are complete in virtue of having attained their end. So, since the end is a last thing, we transfer the term to base things and say that a thing has been completely ruined and completely destroyed, when there is no deficiency in its destruction and badness but it has reached its last [point]. That is why death too is by transference said to be an end—because both are last things. And the end—that is, the for-the-sake-of-which—is a last thing.

This, then, is the number of ways in which things said to be intrinsically complete are said to be such, some because with respect to goodness they are deficient in nothing and can neither be exceeded nor can anything of theirs be found outside them, others because, in general, they cannot be exceeded in their several kinds and have nothing of theirs outside them. The rest are said to be complete with reference
1022a1 to these, because they either produce or possess something of the relevant sort, or are fitted for it, or in some way or other are said to be complete with reference to the things that are said to be such in the primary way.

225. *Cat*. 11a24–32; also *Top*. 124b18–19.

5.17
Limit

What is said to be a limit is: The last point of each thing, that is, the first outside which it is not possible to find any part, or the first inside which every part is found. The form,[226] whatever it may be, of a spatial magnitude or of what has spatial magnitude. The end of each thing (that toward which there is movement or action, not that from which—although sometimes it is both, that from which and that toward which[227]) and the for-the-sake-of-which. The substance of each thing and the essence of each; for this is the limit of knowledge, and if of knowledge, of its object too. So it is evident that things are said to be a limit in as many ways as they are said to be a starting-point, and yet more; for a starting-point is a sort of limit, but not every limit is a starting-point.

5.18
In Virtue of Which

Something is said to be that in virtue of which (*kath' ho*)[228] in many ways. The form and the substance of each thing—for example, that in virtue of which a man is good is good itself. The primary thing in which something naturally comes to be—for example, color in a surface. The primary way, then, in which something is said to be that in virtue of which is by being the form, and in a secondary way by being the matter of each thing and the first underlying subject of each.

In general, that in virtue of which belongs to things in the same number of ways as the cause does; for "in virtue of what has he come?" is said, or "for the sake of what has he come?" or "in virtue of what has he deduced, or wrongly deduced?" or "what is the cause of his deducing, or wrongly deducing?"

Further, something is said to be that in virtue of which with reference to position—for example, that with reference to whose position he stands based, or walks; for all these signify position or place.[229]

And so intrinsically [or in virtue of itself] must also be said of things in many ways. For in one way, the essence of each thing is what it is intrinsically—for example, Callias is intrinsically Callias, as is the essence of Callias. In another way, anything that is present in the what-it-is—for example, Callias is intrinsically an animal; for animal is present in his account; for Callias is a sort of animal.

226. Here the shape or spatial arrangement rather than the form that is identical to the essence.
227. E.g., *NE* $1143^{b}10–11$.
228. No single English expression captures all its senses.
229. Reading πάντα γὰρ ταῦτα.

Further, if it, or one of its parts, is the primary recipient—for example, a surface is intrinsically white, and a human is intrinsically alive; for the soul, which is a part of a human, is the primary recipient of life.

Further, what has no other cause; for a human has many causes, animal, two-footed, nonetheless a human is intrinsically a human.

Further those affections are intrinsic to a subject that belong to it alone, and insofar as they belong to it merely because of itself, considered as what is separate by itself.[230]

5.19
Disposition

1022b1 What is said to be a disposition is the arrangement of what has parts with respect either to place, capacity, or form; for it must be some sort of position, as the name "dis*position*" also indicates.

5.20[231]
Having (or State)

What is said to be a having [or state] (*hexis*) in one way is a sort of activation of the haver and what he has, like a sort of action or movement; for when one thing makes and another is made, there is a making between them. In the same way too between the person who has clothes and the clothes he has there is a having. This sort of having, then, it is evident that one cannot have (for it would go on without limit if it were possible to have the having of what one has). What is said to be a having [or state] in another way is a disposition in virtue of which what is disposed is either well- or ill-disposed, and either intrinsically or with reference to something else—for example, health is a state; for it is a disposition of this sort. Further, anything that is a part of such a disposition is said to be a state—which is why the virtue of [a thing's] parts is also a state.

5.21
Affection

What is said to be an affection in one way is a quality in virtue of which a thing can be altered—for example, white and black, sweet and bitter, heaviness and lightness, and other things of this sort, in another way, the activations of these, the already accomplished alterations. Further, of these, especially alterations and movements that

230. Reading δι' αὐτὸ κεχωρισμένον καθ' αὑτό.
231. Cf. *Cat*. 15.

are injurious—above all, painful injuries. Further, large-scale misfortunes and painful experiences are said to be affections.

5.22
Privation (Lack)

Something is said to lack something in one way if it does not have one of the affections that something or other naturally has, even if this thing itself does not naturally have it—for example, a plant is said to lack eyes. In another way if what it or its kind naturally has, it itself does not have—for example, a human being who is blind and a mole lack sight in different ways, the former in contrast to its kind, the latter intrinsically. Further, if it does not have what it is natural for it to have when it is natural for it to have it; for blindness is a sort of privation, but a being is not blind at any and every age, but only if it does not have sight when it is natural for it to have it. Similarly, if it does not have sight in that in which, and in virtue of which, and in relation to which, and in the way in which, is natural.[232] Further, a thing forcefully taken away is said to be lacked.

Also, things are said to be privations (lacks) in as many ways as there are ways of saying things with a negative affix; for something is said to be *un*-equal because it does not have the equality it is natural for it to have, and *in*-visible either because it has no color at all or because it has minimal color, and foot-*less* either because it has no feet or minimal feet. Further, a thing is said to lack something if it has little of it—for example, pitless fruit. This is a case of having it minimally. Further, if it does not have it easily or well—for example, we say that something is uncuttable not only if it cannot be cut but if it cannot be cut easily or well. Further, if it does not have it at all; for a man who has no sight in one eye is not said to be blind, but rather the man who has no sight in either eye. That is why not everyone is good or bad, just or unjust, but there is also an intermediate state.

5.23[233]
Have (Hold)

Something is said to have [or hold] in many ways. One way is to treat it in accord with the possessor's own nature or in accord with its own impulse. That is why a fever is said to have hold of a human being and tyrants to have hold of their cities, and people to have the clothes they wear. In another way, what a thing is present in, as in something receptive of it, is said to have it—for example, the bronze has the form of the statue, and the body has the disease. In another way, what encompasses something is said

232. Respectively, the medium (normal light, not darkness), the organ (eyes, not ears), the object (color, not sound), e.g., the direction (in front, not behind).
233. Cf. *Cat*. 15.

to hold what it encompasses; for what is in what encompasses it is said to be held by it—for example, that the vessel holds liquid, and the city human beings, and the ship sailors. And it is this way that the whole has its parts. Further, what hinders a thing from moving or acting in accord with its own impulse is said to hold it—for example, the pillars hold the weight lying on them, and, as the poets say, "Atlas holds up the heaven,"[234] on the supposition that it would fall to the earth otherwise, as some of the natural scientists also say.[235] This is also the way in which what holds things together is said to have them held together, on the supposition that they would otherwise separate, each in accord with its own impulse. Also, things are said to be in something in ways that are similar to and correspond to those in which they are said to have them.

5.24
Of (From)

Something is said to be of (from) something in one way if it is of it as matter, and this in two ways, either with respect to the first kind or with respect to the ultimate form—for example, in one way everything meltable is of water, but in another way a statue is of bronze. In another way, if it is of it as of a first starting-point of having moved—for example, what did the fight come of? It came of abusive language, because this was the starting-point of the fight. In another way, as of the composite of matter and shape—as the parts are of the whole, and the verse of the *Iliad*, and the stones of the house; for the shape is an end, and what possesses its end is complete. In other cases, as the form is composed of its parts—for example, the human of two-footed and the syllable of the letter; for this is different from the way in which the statue is composed of bronze; for a composite substance is composed of perceptible matter, but the form is also composed of the matter of the form.[236]

Some things, then, are said to be of (from) something in these ways; but others, if one of these ways holds with reference to a part of them—for example, the child is of its father and mother, and plants are of the earth, because they are of a part of these things. In another way, something is said to come of something if it comes after it in time—for example, night comes of day and a storm comes of good weather, because one comes after the other. Among these things, some are said to do so because they admit of change into each other, as in the cases mentioned just now, others merely because they are successive in time—for example, the voyage took place of the equinox, because it took place after the equinox, and the festival of the Thargelia comes of the Dionysia, because after the Dionysia.[237]

234. Hesiod, *Theogony* 517.
235. *Cael.* 284a24–26.
236. I.e., the formal elements from which the form is composed.
237. The first is a feast of Apollo held in Athens and some other cities in late May, the second a feast of Dionysus held in Athens at the end of March.

5.25
Part

What is said to be a part in one way is what a quantity can in any way be divided into; for what is subtracted from a quantity insofar as it is a quantity is always said to be a part of it—for example, two is said to be a part of three. In another way, only those among the first lot that are measures[238]—which is why two is said to be part of three in one way, while in another way it is not. Further, what the form—quantity aside—can be divided into are also said to be parts of it; that is why the forms of a kind are said to be its parts. Further, the things into which a whole, whether a form or something that has a form, is divided, or of which it is composed—for example, of the bronze sphere or the bronze cube both the bronze (that is, the matter in which the form is) and the angle[239] are parts. Further, the things in its account that make a given thing clear are also parts of the whole[240]—which is why the kind is said to be a part of the form, although in another way the form is a part of the kind.

5.26
Whole

Something is said to be a whole: If none of the parts of which it is said to be by nature a whole is absent from it. If it is what encompasses the things it encompasses in such a way that they are one, and this in two ways—either as each being one or as together composing one. For what is universal, and in general, what is supposed to be such when one says "as a whole," is universal as encompassing many things by being predicated of each of them, and by all of them—each one of them—being one thing, as human, horse, and god are, because all are living things. But what is continuous and limited is a whole when it is one thing composed of many things, especially if they are present in it potentially, but, failing this, if they are actively present in it. Among these themselves, those which are by nature of such a sort are wholes to a higher degree than those that are so by craft, as we also said[241] in the case of one, wholeness being in fact a sort of oneness.

Further, of quantities that have a starting-point, a middle, and an end, those to which the position of the parts makes no difference are said to be alls, and those to which it does, wholes. Those that admit of both are both wholes and alls. These are things whose nature remains the same when the parts change position while their shape does not remain the same—for example, wax or a cloak; for they are said to be both wholes and alls; for they have both characteristics. Water, and all liquids and

238. $1052^{b}20$–27.
239. I.e., the form definitive of the figure.
240. I.e., the whole form.
241. $1016^{a}4$.

number, are said to be alls, but things are not said to be the whole number or the whole water except by metaphorical transference.

Things to which "all" is applied as to one thing are said to be all, "all" being applied to them as divided up—all *this* number [of units], but *all these* units.

5.27
Docked

Not just any random quantity is said to be docked; on the contrary, it must be divisible into parts and also a whole. For not only is two not docked if one of its pair of ones is subtracted (for what is subtracted by docking and what remains are never equal), but, in general, no number is docked in this way; for it is also necessary that the substance remain: if a cup is docked, it must still be a cup, while the number is no longer the same. Further, not even all things that have dissimilar parts are said to be docked (for in one way a number has dissimilar parts too—for example, two and three). But, in general, none of the things to which the position of the parts makes no difference—for example, water and fire—are said to be docked. On the contrary, to be of this sort a thing must in virtue of its substance have parts with position. Further, it must be continuous; for a musical scale is composed of non-uniform parts and parts that have a position, but cannot become docked. In addition to this, not even the things that are wholes are docked by the privation of any part whatever; for the parts must be neither those that control its substance[242] nor those positioned just anywhere—for example, a cup is not docked if a hole is bored in it, but only if the handle or a projecting part is removed, and a human being, not if some flesh or the spleen is removed, but if an extremity is—and this not any extremity but one that when wholly removed cannot grow back. That is why bald people are not docked.[243]

5.28
Kind (Race)

Something is said to be a kind (race), on the one hand, if the coming to be of things with the same form is continuous—for example, "as long as the race of human beings lasts" means as long as the coming to be of human beings is continuous; on the other hand, if it is the first mover that brought things into existence; for it is in this way that some are said to be Hellenes by race and others Ionians, because the former come from Hellen and the latter from Ion as their first begetter. And more so when from the male begetter than when from the matter,[244] although the race is also sometimes

242. 1035ᵇ25–27.
243. *HA* 518ᵇ12–27, *GA* 783ᵇ8–22.
244. *GA* 765ᵇ9–15.

named from the female—for example, the descendants of Pyrrha. Further, as the plane is said to be the kind of plane figures and solid of solids; for each of the figures is, in the one case, a plane of such-and-such a sort and, in the other case, a solid of such-and-such a sort, since this is the underlying subject for the differences. Further, as the first constituent in accounts[245] is said to be—that said in the what-it-is; for this is the kind, whose differences the qualities are said to be.

Something is said to be a kind, then, in all these ways: with reference to continuous coming to be of the same form, with reference to the first mover that is the same in form [as the things it begets], and as matter; for that to which the difference or quality belongs is the underlying subject, which we call "the matter."

Things are said to be distinct [or other] in kind whose primary underlying subjects are distinct, and when the one is not analyzed into the other or both into the same thing—for example, the form and the matter are distinct in kind. As also are those that are said of something with reference to distinct figures of predication of being (for some of the beings signify what-it-is, others a quality, others the various other things that were distinguished previously[246]). These too are neither analyzed into each other nor into some one thing.

5.29
False

What is said to be false in one way is what is false as a thing,[247] and this [in two ways]: Either because it is not combined or cannot be combined—as is said, for example, of the diagonal's being commensurable with the side or of you being seated; for of these the former is always false and the latter sometimes false; for it is in this way that these things are not. Or because, though the things in question *are*, their nature is either to appear not to be such as they are or to be things that are not—for example, illusionistic paintings or dreams; for these are something, but are not the things whose appearance they produce in us. Things are said to be false in these ways, then, either because they themselves are not or because the appearance they give rise to is of something that is not.

A false account, insofar as it is false, is of things that are not, which is why every account is false of something other than what it is true of—for example, the account of a circle is false of a triangle. Each thing has in a way one account, that of its essence, and in a way many, since both it itself and it with an affection are in a way the same (for example, Socrates and musical Socrates), while a false account is, unconditionally, not the account of anything. That is why Antisthenes was naive in thinking that nothing could be fairly put into words except by means of the account that properly

245. $1037^{b}29–30$, *Top*. $142^{b}27–29$.
246. $1017^{a}24–27$.
247. $1051^{a}34–^{b}6$.

belonged to it, one to one.[248] From which it followed that there was no such thing as contradicting, and almost that there was no such thing as speaking a falsehood either. But it is possible to put a given thing into words not only by means of the account of itself but also by means of the account of something else. This may be done altogether falsely indeed, but also in a way truly—for example, eight is a double number by the account of two.[249]

1025a1 These things, then, are said to be false in these ways. But a false human being is one who readily and by deliberate choice gives false accounts, not because of something else but because of giving false accounts itself, and who produces such accounts in other people, just as we say things are false when they produce a false appearance in us. That is why the argument in the *Hippias*,[250] that the same human being is false and true, is misleading. For it assumes that someone is false if he is capable of falsity, that is, the one who knows and is wise, and further, that someone who voluntarily does base actions is better. This false assumption is due to the induction;[251] for someone who limps voluntarily is better than one who does so involuntarily—if by "limping" is meant pretending to limp, since if someone were really lame voluntarily, he would presumably be worse, as in the case of character.

5.30
Coincident

Something is said to be a coincident when it belongs to something and can be truly said of it, but neither of necessity nor for the most part—for example, if someone digging a hole for a plant has found treasure. This—the finding of treasure—is therefore a coincident of the person who is digging the hole; for neither does the one of necessity come from the other, or after the other, nor, if someone plants something, does he for the most part find treasure. Also, a musical person might be pale. But since this does not happen of necessity or for the most part, we say it is a coincidence. So, since there are things that belong and things they belong to, and some of them belong to these only in a particular place or at a particular time, whatever belongs to a subject, but not because it was this subject, or the time this time, or the place this place, will be a coincident. Nor, then, is there a definite cause of a coincidence,

248. The idea is that an account that does not exactly fit A, and A alone, is not a false account of A, but rather is not an account of A at all. Antisthenes evidently combined this idea with the view that the what-it-is or essence of simple things cannot be said or defined (1043b23–32).
249. A number m is a double number when there is a number n such that $m = 2 \times n$. Hence the account of 2 is part of the account of a double number. The number 8 can then be correctly put into words or symbols as $2 \times (2 \times 2)$, using the account of something other than itself. Similarly 9 can be falsely put into words, using the account of something else, as it is when we define it as a double number.
250. Plato, *Hippias Minor* 365d–369b.
251. At *Hippias Minor* 373c–376c.

but a random one, that is, an indefinite one. Going to Aegina was a coincidence, if someone went not because he set out to visit there, but because he was carried off course by a storm or captured by pirates. The coincidence took place, then, or exists but not insofar as it is itself, but insofar as it is another thing; for the storm was the cause of his getting to the place to which he was not sailing, and this was Aegina.

Things are said to be coincidents in another way too: whatever belongs to each thing intrinsically but is not in its substance, as, for example, having its interior angles equal to two right angles does to the triangle. And coincidents of this sort may be eternal, while no coincident of the other sort is. The account of this is elsewhere.[252]

BOOK 6 (EPSILON)

1025^{b}1

6.1[253]
The Three Theoretical Philosophies

It is starting-points and causes of the beings that are being inquired about, and clearly qua beings. For there is some cause of health and of good physical condition, and there are starting-points, elements, and causes of the objects of mathematics, and in general, every science that proceeds by thinking or that has some share in thinking is concerned with causes and starting-points, whether more exactly or more simply considered. All these sciences, however, mark off a certain being, that is, a certain kind, and busy themselves with it, but not with being unconditionally, or qua being, nor do they produce any account of the what-it-is. Instead, starting from the what-it-is—some making it clear by means of the perceptual modalities, some getting hold of it as a hypothesis—they in this way proceed to demonstrate the things that belong intrinsically to the kind with which they are concerned, either in a more necessary or in a weaker way. Which is why it is evident from such an induction[254] that there is no demonstration of [the] substance nor of the what-it-is, but some other way of making it clear. Similarly, they say nothing as to whether the kind they busy themselves about does or does not exist, because it belongs to the same sort of thinking to make clear both its what-it-is and whether it exists.[255]

But since natural science too is a science concerned with a particular kind of being (for it is concerned with the sort of substance in which the starting-point of movement and of rest is internal to itself), it is clear that it is neither a practical science nor a productive one (for in the case of producible things the starting-point is in the producer, whether this is understanding, craft, or some capacity, while in the case of

252. 6.2–3, 11.8, *APo*. 75^{a}18–22.
253. Cf. 5.1, 11.7.
254. I.e., the review of the various special sciences that has just been summarized.
255. *APo*. 93^{a}16–20.

things doable in action it is in the doer, the deliberate choice; for what is doable in action and what is deliberately choosable are the same), so that if all thought is either practical, productive, or theoretical, natural science would have to be some sort of theoretical science—but a theoretical science that is concerned with the sort of being that is capable of being moved, and that in accord with its account holds for the most part, and is not separable only.

But one must not overlook the way the essence or its account is, because, without this, inquiry produces no result. Among things defined, however, that is, of the whats that things are, some are the way the snub is, others the way the concave is. And these differ because the snub is grasped in combination with the matter (for the snub is a concave nose), while the concavity is without perceptible matter. If, then, all natural things are said the way the snub is (for example, nose, eye, face, flesh, bone, and in general, animal, and leaf, root, bark, and in general, plant—for the account of none of these is without [reference to] movement, but always includes matter), the way one should inquire about and define the what-it-is in the case of natural things is clear, as is why it belongs to the natural scientist to get a theoretical grasp even on a certain [part of the] soul, that is, on as much as is not without matter.[256]

That natural science is a theoretical science, then, is evident from these considerations. Mathematics too is a theoretical one, but whether its objects are immovable and separable is not now clear; however, it is clear that some parts of mathematics get a theoretical grasp on their objects insofar as they are immovable and insofar as they are separable.[257] But if there is something that is eternal and immovable and separable, it is evident that knowledge of it belongs to a theoretical science—not, however, to natural science (for natural science is concerned with certain movable things)[258] nor to mathematics, but to something prior to both. For natural science is concerned with things that are separable but not immovable, while certain parts of mathematics are concerned with things that are immovable and perhaps not separable but as in matter. The primary science, by contrast, is concerned with things that are both separable and immovable. All causes are necessarily eternal, and these most of all; for they are the causes of the divine beings that are perceptible.[259] So there must be three theoretical philosophies: mathematical, natural, and theological; for it is not unclear that if the divine belongs anywhere, it belongs in a nature of this sort. And of these, the most estimable must be concerned with the most estimable kind. Of the various sciences, then, the theoretical ones are the more choiceworthy, and this of the theoretical ones.

For one might raise a puzzle as to whether the primary philosophy is universal or concerned with a particular kind and one particular nature (for it is not the same way

256. *DA* 403a3–b16, 429a22–25.
257. *Ph.* 193b31–194a12.
258. Reading περὶ … φυσικὴ.
259. I.e., the immovable movers of the stars and heavenly bodies. See 12.8, 1072a26–30, 1073a23–b1, *Cael.* 285a29–30.

even in the mathematical sciences, but rather geometry and astronomy are concerned with a particular nature, while universal mathematics[260] is common to all). If, then, there is not another sort of substance beyond those composed by nature, natural science will be the primary science. But if there is some immovable substance, this [theological philosophy] will be prior and will be primary philosophy, and it will be universal in this way, because it is primary.[261] And it will belong to it to get a theoretical grasp on being qua being, both what it is and the things that belong to it qua being.

6.2
Coincidental Being and What Happens for the Most Part

But since being is said unconditionally of things in many ways, of which one, we saw,[262] is coincidentally, another as being true, and not being as false, while beyond these there are the figures of predication (for example, what a thing is, quality, quantity, place, time, and anything else that being signifies in this way), and beyond these again potential being and active being—since, then, things are said to *be* in many **1026^{b}1** ways, about the coincidental sort it must first be said that there can be no theoretical investigation concerning it.

A sign of this is that no science—whether practical, productive, or theoretical—pays attention to it. For someone who produces a house does not produce all the things that coincide with the house at the time it is coming into being; for these are unlimited in number; for there is nothing to prevent the house he has produced from being pleasant to some, harmful to others, and beneficial to others, and from being distinct from (one might almost say) all the other beings. But the craft of building is not productive of any of these.[263] In the same way, a geometer does not get a theoretical grasp on what is in this fashion coincidental to his figures, nor whether a triangle and a triangle having interior angles equal to two right angles are distinct.[264] And this happens reasonably; for "coincidental" is like "in name only."

That is why Plato was in a way not wrong when he classified sophistic as being concerned with what is not.[265] For the arguments of the sophists[266] are (one might almost say) above all else concerned with the coincidental—for example, whether musical and grammatical, or musical Coriscus and Coriscus, are distinct or the same,

260. *APo*. $74^{a}17–25$, $76^{a}37–^{b}2$.
261. So it must deal with starting-points and causes that are prior to those of the others, so that those starting-points and causes too fall within its explanatory scope.
262. 5.7.
263. *NE* $1139^{b}1–4$.
264. This is a question for a philosopher ($1004^{b}1–3$, $1026^{b}15–21$).
265. *Sophist* 254a.
266. $1064^{b}23–28$, *Top*. $104^{b}25–27$, *SE* $178^{b}39–179^{a}3$.

or whether everything that is, but is not always, has come to be, so that if someone who was musical has come to be grammatical, he must also have been grammatical and come to be musical, and all the other arguments of this sort; for what is coincidental is evidently somewhat close to what is not. As is also clear from arguments such as this: with things that are in another way there is coming to be and passing away, but with things that are coincidentally there is not.[267]

Nonetheless, as regards the coincidental, it must, as far as possible, be said further what its nature is and due to what cause it exists; for it will perhaps also be clear at the same time why there is no science of it.

Since, then, among the beings, some are always and of necessity the way they are (not in the sense in which something is said to be forced but in the sense in which we say that it does not admit of being otherwise), while others are the way they are neither of necessity nor always but for the most part—this is [the] starting-point and this the cause of the existence of the coincidental; for what is neither always nor for the most part is what we say is coincidental. For example, if in the dog days storm and cold occur, that is a coincidence we say, but not if there is stifling heat, because, while the latter occurs always or for the most part, the former does not. Also, that the human is pale is coincidental (for he is neither always nor for the most part so), but he is not an animal coincidentally. And that the builder cures someone is coincidental, because it is not the builder who naturally does this but the doctor—but the builder was by coincidence a doctor. And the gourmet cook, aiming to give pleasure, might produce something healthy,[268] but not in accord with the craft of gourmet cooking. That is why it was a coincidence, we say, and in a way he produces it, but not unconditionally. For of other things there are sometimes capacities that are productive of them, while of some there is no definite craft or capacity; for of things that are or come to be coincidentally the cause too is coincidentally a cause.

And so since not all things either are or come to be of necessity and always, but most are for the most part, what is coincidentally must of necessity exist—for example, a pale human is neither always nor for the most part musical, but since this happens sometimes, it will be coincidentally—otherwise everything will be of necessity. So the matter that is capable of being otherwise than it for the most part is will be the cause of the coincidental.[269]

One must grasp this starting-point[270] [when one asks] whether there is nothing that is neither always nor for the most part or whether this is impossible. There is, therefore, something beyond these, what is so by luck and coincidentally. But while

267. Pale Coriscus is a coincidental being. If it comes to be or passes away both Coriscus and pale would have to come to be or pass away. But pale, since it is not a substance, cannot do either.

268. Reading τι ὑγιεινόν. The end or goal intrinsic to gourmet cooking is pleasure, not health. See *NE* 1153ᵃ26–27.

269. *GA* 778ᵃ4–9.

270. I.e., the matter.

it belongs to some things to be for the most part, does it belong to none to be always, or is there something eternal? These issues, then, must be investigated later on.[271] But that there is no scientific knowledge of the coincidental is evident; for all scientific knowledge is either of what always is or of what for the most part is; for how else could one learn, or teach someone else? For a thing must be determined either by what is always so or by what is for the most part so—for example, that honey-water is beneficial to a fever patient for the most part. But the exceptions to this cannot be stated,[272] I mean, the times when this does not happen—for example, on the day of the new moon; for it is either always or for the most part that even what happens on the day of the new moon happens. But the coincidental is an exception to that.

What the coincidental is, then, and due to what cause, and that there is no scientific knowledge of it, has been stated.

6.3
Starting-Points of What Happens by Luck

It is evident that there are starting-points and causes that can come to be and pass away without going through a process of coming to be and passing away. For otherwise everything will be of necessity—if whatever is coming to be and passing away must have something that is non-coincidentally its cause. Will this be or will it not? It will if this comes to be; but if not, it will not. And this will if something else does. And in this way it is clear that, since time is always being subtracted from a limited period of time, one will come to the present moment.

So this person will die by violence if he goes out; and he will do this if he gets thirsty; and he gets thirsty if something else; and in this way one will come to what [affections] belong to him now, or to something that has come about—for example, if he gets thirsty, and he does so if he is eating something spicy. And this [affection] either belongs to him or it does not. And so of necessity he will die, or of necessity not die. Similarly, if one jumps over to what has come to be, the same argument applies; for this [affection], I mean the one that has come to be, is already present in something, therefore, everything that will be will be of necessity—for example, that the person who is living dies; for already something has come to be—for example, the presence of contraries in the same thing. But whether by disease or violence is not yet [necessary], but [will be] if this comes about. It is clear, therefore, that it goes back as far as some starting-point, but this one no longer goes back to something else. This, then, will be the starting-point of what happens by luck, and nothing else will be the cause of its coming to be. **$1027^{b}1$**

271. 12.6–8.
272. *Rh.* $1374^{a}32–33$.

But to what sort of starting-point and to what sort of cause we are in this way referred, whether to matter or to the for-the-sake-of-which or to what gets things moving, must be investigated to the fullest extent.[273]

6.4
Being True and Being False

As regards coincidental being, then, let us put it aside; for it has been made sufficiently determinate. As for being as being true and not being as being false, it depends on[274] composition and division, and together have to do with the allocation of a contradictory pair[275] (for truth has affirmation in the case of what is put together and negation in the case of what is divided, while falsehood has the contradictory of this allocation; but the way that understanding things at the same time or separately comes about requires another account,[276] but I mean "at the same time" as opposed to "separately" to imply that what comes about is not a succession of things but a single thing). For falsehood and truth are not in the things, as if the good were true and the bad false from the outset, but in thought, and with regard to simple things and the what-it-ises, not even in thought. Since all this is so, then, what should be done to get a theoretical grasp on this way of being and not being must be investigated later on.[277]

But since the connection and division are in thought and not in the objects, being in this sense is a different thing from being in the strict sense (for thought joins or subtracts[278] either the what-it-is or a quality or a quantity or something[279] else), being coincidentally and being as being true may be left aside—for the cause of the former is indefinite, while that of the latter is a certain affection of thought, and both are concerned with the remaining kind of being, and do not indicate any nature of being as being external.[280] Because of that one must leave them aside and investigate being itself and its causes and starting-points qua being.

It is evident in our discussions of the various ways in which things are said to *be* that they are said to *be* in many ways.

273. The formal cause is omitted because what happens coincidentally or by luck cannot have such a cause, since it cannot have the sort of scientific explanation that begins with a definition of a form or essence.

BOOK 7 (ZETA)[281]

7.1
Substance as Primary Being

Something is said to *be* in many ways, as we distinguished previously in our discussion of the many ways;[282] for, on the one hand, being signifies the what-it-is and a this something, and, on the other, quality, quantity, or one of the other things predicated as these are. But while things are said to *be* in these many ways, it is evident that primary among these is the what-it-is, which is precisely what signifies substance (for when we say how this thing is qualified, we say that it is good or bad, but not that it is three cubits or a human, while when we say what it is we do not say pale or hot or three cubits, but a human, or a god), and the other things are said to *be*, some by being quantities of what is a being in this way, others qualities, others affections, others something else of this sort.

That is why one might indeed be puzzled about whether walking, being healthy, and sitting are each of them a being or not a being, and similarly too in the case of any other thing of this sort; for none of these is either by its nature intrinsically a being or capable of being separated from substance but, if anything, it is the walking thing that is a being, and the sitting thing, and the one being healthy. These things are manifestly beings to a higher degree, because there is some definite underlying subject for them (and this is the substance and the particular), which is precisely what is made apparent in this sort of predication; for good and sitting are not so said without this. It is clear, then, that it is because of this that each of these other things is as well, so that what primarily is—not is something [else] but is unconditionally—would be substance.

Things are said to be primary in many ways. Nonetheless, substance is primary in all of them—in nature,[283] in account, in knowledge, and in time. For of the various things that are predicated none is separable, but only this. And in account too it is primary (for in the account of each thing the account of substance is necessarily present as a component). And we think we know each thing most of all, when we know, for example, what a human is, or fire, rather than when we know the quality or the quantity or the place, since of these things themselves too we know each one when we know, for example, what the quantity or the quality is. And, in particular, the question **$1028^{b}1$** that was asked long ago, is now, and always will be asked, and is always giving rise to puzzles—what is being?—is just the question, what is substance? (for this is what some people say is one, others more than one, some that it is a limited number, others

282. 5.7.
283. Reading φύσει καὶ.

an unlimited one[284]). And that is why we too must most of all, primarily, and (one might almost say) even exclusively get a theoretical grasp on what it is that is a being in this [substantial] way.

7.2
Are There Any Substances beyond Perceptible Ones?

Substance seems to belong most manifestly to bodies. That is why we say that animals and plants and their parts are substances, and also natural bodies, such as fire, water, earth, and each thing of this sort, together with all their parts and all the things composed of these, whether of parts or of wholes (for example, the heaven and its parts, stars, moon, and sun), but whether these alone are substances, or others as well, or some of these and some others as well, or none of these but some others, must be investigated.[285]

It seems to some people[286] that the limits of body—for example, surface, line, point, and unit—are substances, and more so than body and solid. Further, some do not think that beyond the perceptible things there is anything of this sort, while others think that there are more [substances than that] and that they are substances to a higher degree, because they are eternal. Thus Plato[287] thought that the Forms and the objects of mathematics were two sorts of substances, and that the substance of perceptible bodies was a third. And Speusippus thought that there were even more substances, starting from the one, as well as starting-points for each sort of substance, one for numbers, another for magnitudes, and then another for the soul; and by going on in this way he multiplies the substances. And some say[288] that the Forms and the numbers have the same nature, and that the others—lines and planes—follow after them, right up to the substance of the heaven and the perceptibles.

Concerning these issues, then, what is said correctly or incorrectly—that is, which things are substances, and whether there are any beyond the perceptible ones or not, and the way these latter ones are, and whether there is any sort of substance that is separate, and if so why and in what way, or whether there is none beyond the perceptibles—must be investigated, after first having given a sketch of what substance is.

7.3
Sketch of Substance

Something is said to be substance, if not in more ways, at any rate, most of all in four; for in fact the essence, the universal, and the kind seem to be the substance of each thing, and fourth of these, the underlying subject.

The underlying subject is that of which the other things are said, but which is not itself further said of any other thing, which is why some determinations must be made about it first; for the primary underlying subject seems most of all to be substance. **1029^{a}1**

In one way the matter is said to be a thing of this sort, in another way the shape, and in a third what is composed of these (by "the matter" I mean, for example, the bronze; by "the shape," the configuration of the form as it is presented to sight; and by "what is composed of these," the statue—the compound). So if the form is prior to the matter and more of a being, it will also be prior to what is composed of both of them, for the same reason.

It has now been said in outline what substance is: what is not said of an underlying subject, but of which the other things are said. But one should not say only this; for it is not enough; for it itself is unclear, and besides the matter becomes substance. For if this is not substance, it escapes us what else is; for when the others are stripped away, nothing appears to remain; for while the others are affections, doings, and capacities of bodies, length, breadth, and depth are quantities and not substances (for quantity is not substance). Rather, that primary thing to which these belong, *that* is substance. But when length, breadth, and depth are subtracted, we see nothing left, unless it is something that is given definition by these, so that the matter alone must appear to be substance for those investigating in this way (by "matter" I mean that which, intrinsically, is neither said to be a something, nor a quantity, nor anything else by which being is given definition). For there is something that each of these is predicated of, whose being is distinct from that of each of the things predicated (for while the other things are predicated of the substance, this is predicated of the matter), so that the last thing [in this series] will not be intrinsically a something, or a quantity, or anything else; nor indeed is it the negations of these, for they too will belong to it coincidentally.

For those who try to get a theoretical grasp on things in this way, then, the matter turns out to be substance. But this is impossible; for both separability and being a this something seem to belong most of all to substance, and, because of this, the form and the thing composed of both would seem to be substance more than the matter is. But the substance that is composed of both (I mean from both the matter and the shape) must be set aside, for it is posterior, and clear; and the matter too is in a way evident. But the third must be investigated, for it is the most puzzling. It is agreed that some perceptibles are substances, so that it is among these that it should first be looked for.

{For it furthers the work to proceed toward what is better known. For learning comes about for all in this way—through things by nature less well-known toward ones that are better known. And just as with things in the sphere of action our work is to begin from things that are good for each particular person and make things that are wholly good good for each particular person, so too the work here is to begin from things better known to oneself and make the things that are known by nature known to oneself. But the things that are known and primary for particular groups of people are often only slightly known and have little or nothing of being in them. Nonetheless, beginning from things that are poorly knowable but knowable to ourselves, we must try to know the things that are wholly knowable, proceeding, as has just been said, through the former.}[289]

7.4
Logico-Linguistic Investigation of Essence and Definition

1029b1 Since at the start we determined[290] in how many ways we define substance, and of these one seemed to be the essence, it is necessary to get a theoretical grasp on it.[291] And first let us say some things about it in a logico-linguistic way, because the essence of each thing is what it is said to *be* intrinsically. For the being for you is not the being for musical; for you are not intrinsically musical. [Your essence], therefore, is what you are [said to *be*] intrinsically. But not, certainly, all of this; for what is intrinsic in this way is not so in the way that pale is to surface, because the being for a surface is not the same as the being for pale. But neither is it the being that is composed of both, the being for a pale surface. Why? Because surface itself is added. Therefore, the account in which the thing itself is not present, but it itself is said, this is the account of the essence for each thing. And so, if the being for a pale surface is the being for a smooth surface, the being for pale and for smooth will be one and the same.

But since there are composites in accord with the other categories too (for there is some underlying subject for each—for example, for the quality, the quantity, the time, the place, and the movement), whether there is also an account of the essence for each of these must be investigated, and whether the essence belongs to them too—for example, to pale human.[292] Let us, then, give this the name "cloak." What is the being for a cloak? But then this is not one of the things said to *be* intrinsically either. Or, are things said intrinsically *not to be* in two ways, one being from an addition and the other not? For in one case what is being defined is said to *be* by being added to another thing—for example, if someone defining the being for pale were to state the account of pale human; in the other case, what is being defined is said to *be*

289. This paragraph follows 1029b13 in the mss.
290. 1028b33–1029a2.
291. Because essence is the better-known route to form, which is the target (1029a32–34).
292. 1070b16–21, 1089b27–28.

by another thing not being added to it—for example, if cloak signified pale human, but someone were to define the cloak as pale. (The pale human is indeed something pale in that case, but not, surely, what being for pale was.) **1030^{a}1**

But [what about] the cloak? Is the being for it an essence at all? Or not? For the essence is precisely what something is. But when one thing is said of another, it is not precisely a this something—for example, the pale human is not precisely a this something, if indeed the this belongs only to substances. So there will be an essence only of those things whose account is a definition. There is a definition, however, not when a name and an account signify the same thing (for then all the accounts would be definitions; for there will be a name answering to any account whatever, so that even the *Iliad* will be a definition), but when the account is of something primary; and primary things are those that are said not by way of saying one thing of another. Therefore, the essence will belong to things that are forms of a kind and to nothing else (for these seem not to be said by way of participation or as an affection, or in a coincidental way).[293] But there will be an account of each of the other things too and what it signifies, [stating] if it is a name, that this belongs to this, or, instead of a simple account, a more exact one. There will not, however, be a definition or an essence.

Or is something said to be the definition in many ways too, just like the what-it-is? For in fact the what-it-is signifies in one way the substance and the this something, and in another way it signifies each of the other things that are predicated—quantity, quality, and the like. For just as *is* also belongs to all of them, but not in the same way, but to one in a primary way and to the others in a derivative one, so too the what-it-is belongs unconditionally to the substance and in a way to the others; for we can also ask what quality is, and so quality too is something with a what-it-is—but not unconditionally. Rather, just as in the case of what is not, some people say in a logico-linguistic way that what is not is (not that it is unconditionally but that it is what is not), so too with the quality.

One should, then, also investigate how one should speak about each of them, but not more so than how the thing in fact is. That is why now too, since what is said is evident, it is also evident that the essence will belong in a similarly primary and unconditional way to the substance, and derivatively to the others, just as with the what-it-is—not the unconditional essence, but the essence for a quality, or for a quantity. For it must either be homonymously that one says that these things are beings, or by adding something or by subtracting something, just as what is not scientifically known is scientifically known,[294] since what is correct, surely, is that they are said [to be] neither homonymously nor in the same way, but as with medical, with reference to one and the same thing[295]—not saying one and the same thing, but not speaking homonymously either; for a body, a work, and an implement are said **1030^{b}1**

293. 1037^{b}14–21.
294. By subtracting "not."
295. 1003^{a}34–^{b}10.

to be medical neither homonymously nor in accord with one thing, but rather with reference to one thing. But whichever of the two ways one proposes to say that these things [are beings] makes no difference. This, however, is evident: that in the primary and unconditional way definition and the essence belong to substances—not that they do not also equally belong to the other things, except not in the primary way.

For it is not necessary, if we accept this view, for there to be a definition of this sort whenever a name signifies the same thing as an account, but rather the same thing as an account of a certain sort, and this occurs if it is of something that is one—not by continuity, like the *Iliad*, and not in the way in which things are one by being tied together, but one in the ways in which things are said to be one. But things are said to be one as they are said to *be*, and being signifies, on the one hand, the this something and, on the other, some quality or quantity. That is why there will be an account of pale human and a definition, but in another way than there is of the pale and of substance.

7.5
Definition Continued

There is a puzzle, if one denies that an account composed from an addition[296] is a definition, as to whether there will be a definition of any of the things that are not simple but coupled; for these must be indicated by an addition. I mean, for example, there is nose and concavity, and snubness is what is said of things composed of both, as this in this. And it is not coincidentally that the concavity or the snubness is an affection of the nose, but intrinsically—not in the way that the pale is of Callias, or of a human (because Callias, who is coincidentally a human, is pale) but in the way that male is of animal, or equal of quantity, and in the way all things are that are said to belong to something intrinsically. These are the ones in which belongs either the account or the name of that of which this is the affection, and which cannot be indicated separately, in the way that pale can be indicated without human, but not female without animal. So either there is no essence or definition of any of these [coupled] things, or, if there is, it is in another way, as we said.[297]

But there is also another puzzle about these things. For if snub nose is the same as concave nose, the snub and the concave will be the same. But if they are not the same, because it is impossible to say snub without saying the thing of which it is an intrinsic affection (for the snub is concavity in a nose), it must either be impossible to say the snub nose, or the same thing will be said twice, concave nose nose (for the snub nose will be the concave nose nose). That is why it is absurd that the essence should belong

296. 1031[a]4–5.
297. 1030[a]17–[b]13.

to things like this. If it does, it will go on without limit; for in snub nose nose there will be yet another one.

It is clear, therefore, that only of substance is there a definition. For if there were also a definition of the other things that are predicated, it would necessarily be composed from an addition, like that of odd; for it is not definable without number, or female without animal. (By "addition" I mean the cases in which it turns out that the same thing is said twice.) **1031a1**

But if this is true, things that are coupled—for example, odd number—will not have a definition either (but this escapes notice because their accounts do not describe them in an exact way). But if there are also definitions of these, either it must be in another way or, as was said, things must be said to be the definition and the essence in many ways, so that in one way there will not be any definition or any essence that belongs to anything except the substances, and in another way there will.

It is clear, then, that the definition is the account of the essence, and that the essence is either of the substances alone, or of them most of all, primarily, and unconditionally.

7.6
Is Each Thing the Same as Its Essence?

But whether each thing and its essence are the same or distinct must be investigated. For this will further the work relating to the investigation concerning substance; for each thing seems to be nothing other than its own substance, and the essence is said to be the substance of each thing.

In the case of things said coincidentally they would seem to be distinct—for example, a pale human seems to be distinct from the being for a pale human (for if they were the same, the being for human and for pale human would be the same; for a human and a pale human are the same, as people say, so that the being for a pale human and for a human would be the same too. Or is there no necessity for things that are coincidentally [the same] to be the same? For the extreme terms do not become the same in the same way.[298] But perhaps this might seem to follow, that the extreme terms would be the same coincidentally—for example, the being for pale and the being for musical. But it seems not to.

In the case of things that are said to *be* intrinsically, however, is it necessary that the thing be the same [as its being or essence]? For example, if there are some substances to which no substances or any other natures are prior, of the sort that some

298. (1) A pale human = the being for a pale human. (2) A human (who is coincidentally pale) = a human. (3) A human = the being for a human. (4) Therefore, the being for a human = the being for a pale human. But (4) is false, since someone can be a human without being pale, and so (1) must be false. The extreme terms are those in (4), "the being for a human" and "the being for a pale human."

people say the Forms are? For if the good-itself and the being for a good are distinct, also animal[-itself] and the being for an animal, also the being for a being and being, **1031ᵇ1** there will be other substances and natures and Forms beyond those mentioned, and these other substances will also be prior, if the essence is substance. And if the two are detached from each other, there will be no scientific knowledge of the former ones, while the latter ones will not be beings (by "detached from each other" I mean if the being for a good neither belongs to the good-itself nor being good to the being for a good); for there is scientific knowledge of each thing when we know its essence. And what holds in the case of the good holds equally for the others, so that if not even the being for a good is a good, neither will the being for a being be a being, nor will the being for a one be a one. Similarly, either all the essences are, or none of them are, so that if not even the essence for a being is a being, none of the others is either. Further, that to which the essence for a good does not belong is not a good.

The good, therefore, is necessarily one with being for a good, and similarly beauty and being for a beauty, and so with all things that are not said to *be* with reference to something else but are intrinsic and primary; for in fact it is enough if this feature belongs to them, even if they are not Forms, but more so, presumably, if they are Forms. At the same time, however, it is also clear that if indeed the Forms are as some people say they are, the underlying subject will not be substance; for the Forms are necessarily substances, but not by being [predicated of] an underlying subject; for then they will *be* in accord with participation.

On the basis of these arguments, then, each thing itself and its essence are one and the same, and not in a coincidental way, and because to scientifically know each thing is just to scientifically know its essence, so that, even by setting-out, the two must be one and the same.

But of what is said to *be* coincidentally, for example, the musical or the pale, because it has a double signification, it is not true to say that it and its essence are the same; for in fact what the coincident belongs to is pale as is the coincident, so that in one way it and its essence are the same, and in another not the same; for the pale is not the same as the human, that is, as the pale human, but it is the same as the affection paleness.

The absurdity would become apparent if one assigned a name to each of the essences; for beyond this original one, there will be another—for example, for the essence of a horse there will be another essence for a horse. And yet, even as things stand, what is to prevent some things from being their essences from the outset, if indeed the essence is substance? But then, not only are they one, but also the accounts **1032ª1** of them are the same, as is clear also from what has been said; for it is not coincidentally that one and the being for one are the same. Further, if they are distinct, it goes on without limit; for, on the one hand, there will be an essence for the one and, on the other, there will be the one, so that the same argument will apply to these too.

It is clear, then, that in the case of the things that are primary and that are said to *be* intrinsically, the being for each is one and the same as the thing. And it is evident

that sophistical refutations of this thesis are to be resolved using the same resolution as in whether Socrates and the being for Socrates are the same;[299] for there is no difference either in the materials on the basis of which one would raise one's questions or in those on the basis of which one would find a resolution of them.

In what way the essence of each thing is the same as the thing, then, and in what way it is not the same, has been stated.

7.7
Form in Matter-Form Compounds (1)

Among things that come to be, some do so by nature, some by craft, and some from chance, but they all come to be both as a result of something and of (from)[300] something, and they all come to be something—the something I mean may be of any category; for things come to be a this, or of some quality, or of some quantity, or somewhere.

The natural comings to be are those of the things whose coming to be is from nature. What they come to be of is what we call "matter"; that as a result of which they come to be is something that is by nature a being; and the something they come to be is a human or a plant or something else of this sort, which we say are substances most of all. And all the things that come to be either by nature or by craft have matter; for each of them is capable both of being and of not being, and this capacity is the matter in each. In universal terms, then, that from which is nature, and that in accord with which is nature (for what comes to be has a nature—for example, a plant or an animal), and also that as a result of which. This is the one that is said to be the nature that is in accord with the form, which is the same in form [as what comes to be] (but in another thing; for a human begets a human).

That, then, is the way things come to be that come to be because of nature. The other comings to be are called "productions." And all productions come either from craft, or from some capacity, or from thought. Some of them, however, may come to be by chance or by luck, in much the same way as the ones found in those that come to be because of nature; for sometimes there too some of the same things come to be either from seed or without seed. These, then, must be investigated later on.[301] From craft the things whose form is in the soul come to be (and by "form" I mean the essence of each thing and the primary substance); for even contraries **$1032^{b}1$** in a way have the same form; for the opposing substance is the substance of the privation—for example, health is the substance of disease (for disease is the absence of health), while health is the account in the soul and the scientific knowledge. So what is healthy comes to be when one has understood as follows: since this is what

299. $1037^{a}5–10$, $1043^{b}2–4$.
300. 5.24.
301. $1034^{a}9–21$, $^{b}4–7$.

health is, necessarily if the thing is to be healthy, this must be present—for example, a uniform state—and if the latter is to be present, there must be heat, and the doctor goes on, always understanding in this way, until he is led to a final this that he himself is able to produce. Then the movement from this point onward is called a "production"—the one that leads to being healthy. So it turns out that in a way health is produced from health, and a house from a house, the one that has matter from the one without matter; for the craft of medicine and the craft of house-building are the form of health and of a house (by "the substance without matter" I mean the essence).

Of comings into being and movements, one part is called "understanding" and the other "producing"—what proceeds from the starting-point and form is understanding, what proceeds from the final stage of understanding is producing. And each of the other things—those in between—comes to be in the same way. I mean, for example, if he is to be healthy, he must be made uniform. But what is it to be made uniform? This. And it will come about if he is made warm. And what is it to be made warm? This. And it is present potentially; and for it to be actually present is up to [the doctor] himself. What produces, then, and what the process of becoming healthy starts from, if it is from craft, is the form in the soul, but if it is from chance, it is from whatever it is that is a starting-point of producing for what produces from craft—for example, in the case of healing the starting-point is presumably from the warming, which the doctor produces by rubbing. Warmth in the body, therefore, is either a part of health or else something similar that is part of health follows it, either immediately or by way of several steps, and this last thing that produces health is in this way a part of health,[302] and of a house (the stones, for example), and similarly of other things. So, as was said,[303] coming to be is impossible if there is nothing preexisting.

But that some part must be present is evident; for the matter is a part (for it is this that is present [within the thing] and comes to be [something]). But is it also one of the things in the account? We do speak in both ways when we say what brazen circles are, speaking of the matter when we say that it is bronze, and of the form when we say that it is a shape of such-and-such sort (shape being the kind in which it is first placed). The brazen circle, then, does have the matter in its account.

As for that from which, as matter, they come to be, some, when they have come to be, are said to be not that, but thaten[304]—for example, a statue is not said to be stone, but stonen. The human who is healthy, by contrast, is not said to be of that from which he comes. The cause of this is that although he comes to be from both the privation and from the underlying subject, which we call the "matter" (for example, it is both the human and the sick that come to be healthy), it is rather from the privation, nonetheless, that he is said to come to be—for example, healthy comes from sick rather than from human. That is why the healthy one is not said to be sick, but is

302. *NE* 1144a1–5, *Rh.* 1362a31–34.
303. 983b17–18, 1069b6.
304. "Thaten" corresponds to *ekeininon*, which is an Aristotelian coinage, to which the "en" suffix generates analogs in English.

said to be human, and the human is said to be healthy. In cases where the privations are unclear or nameless, however, such as that of whatever shape it happens to be in bronze, or that of a house in bricks and timbers, the thing seems to come to be from these materials as in the previous case it did from being sick.

That is why, just as in that previous case the thing is not said to be what it is from, so in these cases too the statue is said not to be wood, but by derivation, wooden, and brazen, not bronze, and stonen, not stone, and the house is said to be bricken, not bricks. But it is not the case either that a statue comes to be from wood, or a house from bricks, since if someone looked intensely, he would not say this unconditionally, because what something comes to be from must change, and not remain. That, then, is why they are said in this way.

7.8
Form in Matter-Form Compounds (2)

Since what comes to be, comes to be as a result of something (by which I mean the starting-point of the coming to be) and from something (and let this be not the privation but the matter; for the way in which we say this has already been determined[305]) and comes to be something (and this is either a sphere or a circle or whichever of the others it happens to be), just as the producer does not make the underlying subject (the bronze), so he does not make the sphere either, except coincidentally, because the brazen sphere is a sphere and he does make the former; for to make the this something is to make a this something from what is wholly the underlying subject (I mean that to make the bronze round is not to make the round or the bronze, but a distinct thing: this form in something else; for if the producer makes something, he must make it from something else, for this was assumed[306]—for example, he makes a brazen sphere, but in such a way that from this, which is bronze, he makes this, which **$1033^{b}1$** is a sphere). If, then, he also made this [matter] itself, it is clear that he will make it in the same way, and the productions will go on without limit.

It is evident, therefore, that neither does the form—or whatever one must call the shape that is in the perceptible thing—come to be, nor is there any process of coming to be of it, and the essence does not come to be either (for it is this that comes to be in something else, whether as a result of craft, of nature, or of some capacity). But the producer does make a brazen sphere exist; for he produces it from bronze and sphere; for in this specific thing he produces this specific form, and the result is a brazen sphere. But if there is going to be a coming to be of the being of sphere in general, it will have to be a something [that comes to be] from something. For whatever is coming to be must always be divisible, and be, on the one hand, this, and, on the

305. $1032^{a}17$.
306. $1033^{a}25$.

other, this. I mean, that it must be, on the one hand, the matter and, on the other, the form. If, then, a sphere is the shape that is equidistant from its center, one component of this is what the thing the producer produces will be in, and the other is what will be in that one, and the whole thing is what has come to be—for example, the brazen sphere. It is evident, then, from what has been said, that what is said to be the substance as form does not come to be, but that the compound that is said with reference to this does come to be, and that in everything that comes to be matter is present, and that it is, on the one hand, this and, on the other, this.

Is there, then, any sphere beyond these ones, or any house beyond [that of] bricks? Or would there never have been any coming to be of any this something if there were? But sphere or house signifies such-and-such sort of thing, not a this and a definite thing, and a maker makes or begets from this [matter] such-and-such sort of thing, and, when it has come to be, it is this thing of such-and-such sort. And the whole this—for example, Callias or Socrates—is like this brazen sphere, while the animal and the human are like brazen sphere in general.

It is evident, therefore, that the cause consisting of the Forms (if these are the way some people are accustomed to say the Forms are, things beyond the particulars) is of no use, at any rate, as regards comings to be and substances, and they would not be intrinsically substances because of these.

In some cases indeed it is even evident that the begetter is of this same sort as the begotten (not that they are the same thing, certainly, nor one in number, but one in form)—for example, in the case of natural things (for a human begets a human)—unless something is begotten contrary to nature, as when a horse begets a mule (and even these are similar; for what would be common to both horse and donkey, the closest kind, does not have a name, but would presumably be both, like a mule). So it is evident that there is no need to fabricate a Form as a paradigm (for it was in the case of natural things that Forms were looked for most of all; for these are most of all substances); rather, the begetter is sufficient to produce the thing, and is the cause of the form's being in the matter. And once there is the whole thing, such-and-such sort of form in this flesh and bones, this is Callias or Socrates. And they are distinct because of their matter (for that is distinct), but the same in form (for the form is indivisible).

7.9
Form in Matter-Form Compounds (3)

But one might raise a puzzle as to why it is that some things come to be both by craft and by chance (for example, health), while others do not (for example, a house). The cause is that the matter that serves as the starting-point of the process of coming to be in some cases of producing something, or of something's coming to be by craft, and that has some part of the thing present in it, is of a sort that can be moved by itself,

while in others it is not; and, of the former sort of matter, some can be moved in the particular way required, while some is incapable of it (for many things are capable of being moved by themselves but not in the particular way required—for example, so as to constitute dancing). The things, then, whose matter is of the latter sort—for example, stones—cannot be moved in the particular way required except by something else, although they can in another way.[307] That is why some things will not exist without someone possessing the relevant craft, while others will exist; for movement will be started by those things that do not possess the craft but can be moved by other things that do not possess the craft either, or else from a part [of the product].

It is clear from what has been said that in a way all things come to be from something with the same name, just as in the case of those that do so by nature, or from a part with the same name (for example, the house from a house, insofar as it is a result of understanding; for the craft is the form), or from what has some part of [what comes to be]—that is, if it does not come to be coincidentally; for the primary cause of the production, the intrinsic one, is a part [of the product]. For warmth in the [rubbing] movement produced warmth in the body, and this either is health or a part of it, or a part of health follows it, or health itself does. And that is why it is said to produce the health—because it produces that which the health follows and with which it coincides. So, just as in deductions, the substance is the starting-point of all; for it is from the what-it-is that the deductions come, and from there too the comings to be.

Things composed by nature also have a similarity to these others. For the seed is a producer in the same way as the things that are from craft;[308] for it has the form potentially. And what the seed comes from in a way has the same name [as the offspring], except where there is a deformation; for one should not look for all offspring **$1034^{b}1$** to come to be in the same way as human does from human; for even woman comes from man.[309] That is also why a mule does not come from a mule.

Natural things that come to be by chance, like the ones there [in the crafts], are those whose matter can also be moved by itself with the same movement as the seed moves it. But those whose matter is not capable of this cannot come to be in any other way than from those things [from which they come to be].

It is not only concerning the substance that our account makes clear that the form does not come to be, but also where all the primary things are concerned the account is equally applicable—for example, to quantity, quality, and the other categories. For just as the brazen sphere comes to be but not sphere or bronze, and [the sphere] comes to be in the bronze (for the matter and the form must always be preexistent), that is the way it is too in the case of the what-it-is, of the quality and quantity, and similarly of the other categories; for the quality does not come to be, but wood of

307. The other way is the capacity the sublunary elements have to move to their proper places, unless prevented.
308. *GA* $730^{b}11–23$
309. *GA* $737^{a}18–30$.

that quality, nor does the quantity, but wood or animal of that quantity. And what one grasps from these cases as special to the substance is that it is necessary for there always to preexist another substance, which is actual, to produce it (for example, an animal if an animal is what comes to be), while it is not necessary for the quality or the quantity to preexist actually, only potentially.

7.10
Definition's Relation to Form

Since a definition is an account, and every account has parts, and as the account is to the thing, so the part of the account is to the part of the thing, a puzzle already arises as to whether the account of the parts needs to be present in the account of the whole or not. For in some cases they are manifestly present, but in some not. For the account of the circle does not contain that of the segments, while that of the syllable does contain that of the phonetic elements. And yet the circle also divides into the segments just as the syllable divides into the phonetic elements.

Further, if the parts are prior to the whole, and the acute angle is part of the right angle and the finger is part of the animal, the acute angle will be prior to the right angle and the finger to the human. But the wholes seem to be prior; for with respect to the account the parts are described in terms of the wholes, which are also prior with respect to being without each other.

Or perhaps something is said to be a part in many ways. Among these, one way is what measures with respect to quantity. But this must be set aside. The things, though, from which the substance is composed as parts—this [way of being a part] must be investigated. If, then, there is the matter, the form, and what is composed of
1035a1 them, and the matter, the form, and what is composed of them are substance, there is a way in which even the matter is said to be a part, and a way in which it is not, but rather parts are the things of which the account of the form is composed—for example, of the concavity flesh is not a part (for this is the matter in which it comes to be), but of the snubness it is a certain part. And of the compound statue the bronze is a part, but of what is said to be a statue as form it is not a part (for each thing must be said to be the form, or the thing insofar as it has the form, but must never be said to be intrinsically the material component).

That is why the account of the circle does not contain that of the segments, while that of the syllable does contain that of the phonetic elements; for the phonetic elements are parts of the account of the form, and are not matter, while the segments are parts in this way, as matter in which the form comes to be—although they are closer to the form[310] than the bronze is to the circle when circularity comes to be in bronze. But there is a way in which not even all phonetic elements will be present

310. *Mete*. 390a4–7.

in the account of the syllable—for example, these here in the wax or the ones [that are movements] in the air; for these too are already part of the syllable as perceptible matter. For even if the line, when divided, passes away into the halves, or the human into the bones, sinews, and flesh, it is not the case that, because of this, they are composed of these as being parts of the substance, but rather as from matter; and of the compound, they are parts, but of the form—that is, what the account is of—they are not parts at all. That is why they are not in the accounts either.

In the account of some things, then, the account of the parts that are such as these will be present, while in that of others it must not be, that is, if it is not of the combination [of the matter and the form]; for that is why some things [come to be] from those [materials] as starting-points into which they pass away, while other things do not.

Things that are combinations of the form and the matter, for example, the snub or the brazen circle, are the ones that pass away into these parts, and a part of them is the matter, while those with which the matter is not combined, but are without matter, and whose accounts are of the form alone, these do not pass away, either at all or not in this way. And so of the combinations these are starting-points and parts, but of the forms they are neither parts nor starting-points. And that is why the statue of clay passes away into clay, the [brazen] sphere into bronze, Callias into flesh and bones, and further, the circle into the segments; for there is a sort of circle that is combined with matter; for something is said to be the circle homonymously, [since the term is applied] both to the one said to be such unconditionally and to the particular one, because there is no name special to the particular ones. **$1035^{b}1$**

The truth has already now been stated, but nonetheless let us take up the issue again and state it yet more perspicuously. For the parts of the account, into which the account is divided, are prior to it—either all or some. But the account of the right angle does not divide into the account of the acute angle, rather, that of the acute divides into the right; for the person defining the acute makes use of the right; for the acute angle is one that is less than the right. The circle and the semicircle behave in the same way; for the semicircle is defined by the circle and so is the finger by the whole; for a finger is such-and-such sort of part of a human. And so those things that are parts as matter, into which a thing divides as into matter, are posterior, while those that are parts as parts of the account and of the substance, the one that is in accord with the account, are prior—either all or some.

Since the soul of animals (for this is substance of the animate) is the substance that is in accord with the account and is the form and the essence of such-and-such sort of body (at any rate, each part, if it is to be defined correctly, will not be defined without its work, which it could not have without perception), it follows that the parts of this are prior, either all or some, to the compound animal, and similarly, then, to each particular animal, while the body and its parts will be posterior, and what is divided into these as into matter is not the substance but the compound. These bodily parts, then, are in a way prior to the compound, but in a way not (for they cannot even

exist when they are separated; for it is not a finger in any and every state that is the finger of an animal; instead, a dead finger is only homonymously a finger). But some of these parts are simultaneous [with the compound]: the ones that are controlling and in which the account and the substance are first found—for example, the heart,[311] perhaps, or the brain; for it makes no difference which of them is of this sort.

The human and the horse, and things that are in this way set over the particulars, that is, [taken] universally, are not substance, but rather a compound of a sort, [consisting] of this account and this matter taken universally. As a particular, though, Socrates is already composed of the ultimate matter,[312] and similarly in the other cases.

A part, then, can be a part either of the form (by "form" I mean the essence), or of the compound that is composed of the form and the matter itself. But only the parts of the form are parts of the account, and the account is of the universal; for the being for circle and circle and the being for soul and soul are the same. But of what is already a compound, such as this circle, that is, one of the particular ones, whether perceptible or intelligible (by "intelligible ones" I mean, for example, the mathematical ones, by "perceptible ones," for example, the brazen or wooden ones)—of these there is no definition, but it is with understanding or perception that they are known, and when they depart from this actuality it is not clear whether they are or are not. But they are always said to *be* and are always known by means of the universal account. But the matter is intrinsically unknowable.[313] Some matter is perceptible, however, while some is intelligible—perceptible matter being, for example, bronze, wood, and any matter that is movable, and intelligible matter[314] being the sort that is in the perceptible things but not insofar as they are perceptible, such as the objects of mathematics.

The way things stand, then, concerning whole and part and concerning the prior and posterior, has now been stated. And it is necessary to say in response, when someone asks whether it is the right angle, the circle, and the animal that are prior or the things into which they are divided and from which they are composed, that it cannot be answered simply. For if even the soul is animal or animate thing, or the soul of each animate thing is this animate thing, and if the circle is being for the circle, and the right angle is being for the right angle (that is, the substance of the right angle), some [whole] should be said to be posterior to some [parts]—for example, to the parts in the account and to the parts of the particular right angle (for both the one with the matter, the brazen right angle, and the one in particular lines are posterior to these). The right angle without matter, by contrast, is posterior to the parts in the account, but prior to the parts in the particular right angle—unconditionally prior to its parts, however, it should not be said to be. But if the soul is a distinct thing and is

311. *GA* 735a14–26.
312. I.e., the matter in which the relevant form is first present.
313. Because form alone is transmitted through perception (*DA* 424a17–20) to understanding (430a7–8).
314. 1037a5, 1045a33–36, 1059b15–16.

not animal, even then some parts must be said to be prior and some must not be said to be prior, as was stated.

7.11
Form and Its Parts

A puzzle arises, which makes perfect sense, as to what sorts of parts are parts of the form and what sorts are not parts of it, but rather of the combination. And yet if this is not clear, it is not possible to define each thing; for the definition is of the universal and of the form. If, then, it is not evident which sorts of parts are parts as matter and which sorts are not, the account of the thing will not be evident either.

In the case of things that manifestly come to be in distinct forms [of matter], as circle does in bronze and stone and wood, it seems clear that these, for example, the bronze or the wood, in no way belong to the substance of the circle, because of its being separate from them. But in the case of things that are not seen being separate, nothing prevents the situation from being similar, just as if all the circles were seen to be of bronze; for nonetheless the bronze would still not belong to the form, but it **1036b1** would be difficult to subtract it in thought. For example, the form of the human is always found in flesh and bones and parts of this sort. Are these, then, also parts of the form and of the account? Or are they not [parts of these], but rather matter—but because the form never comes to be in anything else we cannot separate it?

Since, however, this does seem to be possible, but unclear when, some people already raise the puzzle even in the case of the circle and the triangle, supposing that it is not proper to define these in terms of lines and the continuous, but that all these too are said [of things] in the way flesh and blood are of the human or bronze and stone of the statue. And so they[315] lead everything back to numbers, and say that the account of line is that of the two. And of those who accept the Forms, some say that the dyad is the line-itself, some that it is the Form of the line, for while in some cases the Form and what it is the Form of are the same (for example, the dyad and the Form of the dyad), in the case of the line this is not at all so.

It follows, then, that there is both one Form of many things whose forms are manifestly distinct (which is precisely what followed for the Pythagoreans too), and that it will be possible to make one Form-itself of all things, and make the others not Forms—and yet in this way all things will be one.

It has been stated, then, that there is a puzzle about definitions, and what its cause is. And that is why to lead all things back to Forms in this way and to subtract the matter is superfluous; for presumably some things are this in this, or these things in this state. And the comparison[316] in the case of animal that Socrates the younger used

315. Those (probably Pythagoreans) who define line without reference to matter.
316. Its precise nature is otherwise unknown.

to make is not correct; for it leads away from the truth and makes one suppose that the human can exist without the parts, as the circle can without the bronze. But the case is not similar; for the animal is presumably something capable of perception, and it is not possible to define it without movement, nor, therefore, without the parts being in a certain state. For a hand in any and every state is not a part of the human, but one that is capable of completing its work, and so is animate; but if not animate, it is not a part.

As regards the objects of mathematics, though, why are the accounts of the parts not parts of the accounts, as the semicircles are of the circle? For it is not as if these are perceptible. Or does this make no difference? For there will be matter even of some things that are not perceptible and of everything that is not an essence. The semicircles, then, will not be parts of the universal circle but will be parts of the particular ones, as was said previously;[317] for while there is one sort of matter that is perceptible, there is another that is intelligible.

It is clear too that the soul is primary substance, while the body is matter, and the human or the animal is the thing composed of both taken universally. But Socrates (or Coriscus), if the soul is also Socrates, is twofold (for some regard him as soul, others as the compound). But if he is unconditionally this soul here and this body here, as the universal is, so the particular is too.[318]

Whether there is, beyond the matter of these sorts of substances, another sort of matter, and whether one should look for another sort of substance, such as numbers or something of this sort, must be investigated later on.[319] For it is for the sake of this that we are trying to make some determinations about the perceptible substances, since the theoretical investigation of perceptible substances is in a certain way the work of natural science and secondary philosophy; for it is not only about the matter that the natural scientist must know, but also about the substance that is in accord with the account—even more so.

The way the things in the account are parts in the case of the definitions, and why the definition is an account that is one (for it is clear that the thing is one, but one in virtue of what, given that it certainly has parts), must also be investigated later on.[320]

What the essence is, then, and what way it is intrinsically, has now been stated universally concerning every case, and also why the account of the essence of some things contains the parts of the definiendum, but that of other things does not. And it has been stated that in the account of the substance the parts as matter will not be present—for they are not even parts of that substance, but of the compound one, and of this there is in a way an account and in a way not; for of the compound with the matter there is not an account (for it is indefinite), but with respect to the primary substance there is—for example, of human, the account of the soul; for the substance

317. 1035a1–22.
318. 1035b27–31, 1036a16–25, 1043b2–4.
319. Books 13 and 14.
320. 7.12, 9.6.

is the form present in the thing, from which together with the matter the compound substance is said to be composed—for example, the concavity; for from this and the nose both snub nose and the snubness are composed, for in these the nose will be present twice. But in the compound substance—for example, in snub nose or in Callias—there will be matter present too.

It has also been stated that the essence and the thing are in some cases the same—for example, in the case of the primary substances.[321] By a "primary substance" I mean what is not said to *be* by being one thing in another, that is, in an underlying subject as matter. But things that are [said to *be*] as matter or as combinations with matter are not the same [as their essence], nor are those that are one coincidentally, such as Socrates and the musical (for these are coincidentally the same).

7.12
Definition Again

Let us now speak first—to the extent that it has not already been stated in the *Analytics*[322]—about definition; for the puzzle that was stated there[323] furthers the work of our accounts concerning substance. I mean this puzzle: Why precisely is something one when the account of it is what we call a "definition"?[324] For example, let the account of the human be: the two-footed animal. Why, then, is this one and not instead many—animal and two-footed? For in the case of human and pale they are many when one does not belong to the other, but they are one when it does belong and the underlying subject, the human, has a certain affection (for then one thing comes to be and we have the pale human).

But in the present case one does not participate in the other; for the kind does not seem to participate in the differences (for if it did the same thing would participate in contraries at the same time; for the differences that divide the kind are contraries). But even if it did participate, the argument would be the same, if indeed the differences are many—for example, footed, two-footed, featherless. Why are these one and not instead many? For it is not because these are present [in one kind]; for that way there will be one from all. But surely the things in the definition must be one; for the definition is a certain account that is one and of substance, so that it must be the account of one something; for in fact substance signifies one something and a this something, as we say.[325]

321. $1032^{b}1$–2.
322. *APo*. 2.10, 2.13.
323. *APo.* $92^{a}27$–33.
324. $1030^{a}1$–17.
325. $1003^{a}9$–12, $^{b}32$–33.

One should first investigate definitions that are by division.[326] For there is nothing else in the definition except the kind, which is mentioned first, and the differences; the other kinds are in fact the first one along with the differences combined with it. The first, for example, may be animal, the next two-footed animal, and next again featherless two-footed animal, and similarly if it is said by means of more differences. And, in general, it makes no difference whether it is said by means of many or of few—nor, therefore, whether by means of few or by means of just two. And of the two one is difference and the other kind—for example, in the two-footed animal, animal is kind and the other difference.

If, then, the kind is unconditionally nothing beyond the forms as forms of a kind, or if it is, it is as matter (for the voiced sound is kind and matter, and the differences produce the phonetic elements from this), it is evident that the definition is the account composed of the differences.

But in addition the division should take the difference of the difference—for example, the footed is a difference of animal, and next again one should know the difference of the footed animal insofar as it is footed. So one must not say that of the footed there is, on the one hand, the feathered and, on the other, the featherless, if indeed one is to speak correctly (on the contrary, it is through lack of ability that one will do this), but rather that there is, on the one hand, the cloven-footed and, on the other, the not cloven-footed; for these are differences of foot; for the cloven-footed is a sort of footed. And one should try to proceed always in this way until one reaches the undifferentiated [forms]. At that point there will be precisely as many forms of foot as there are differences, and the footed animals will be equal in number to the differences.[327]

If, then, this is how things stand, it is evident that the ultimate difference will be the substance of the thing and its definition, if indeed one should not state the same thing many times in the definitions; for that would be superfluous. And this is certainly what does happen; for when one says two-footed footed animal one has said nothing other than animal with feet with two feet. And if one divides this too by a proper division, one will be saying the same thing several times over—as many times as there are differences. If, then, one takes a difference of a difference, one difference—the ultimate one—will be the form and the substance. But if one divides coincidentally—for example, if the footed were divided into the pale and the dark—there will be as many differences as there are cuts.

So it is evident that the definition is the account composed of the differences, or, if it is in accord with the correct procedure, the ultimate one. This would be clear if one were to change the order in such definitions—for example, in that of the human, saying two-footed footed animal; for it is superfluous to say footed when two-footed

326. *APr*. 1.31, *APo*. 2.5, 2.13.
327. Cf. *PA* 643ᵇ10–26, *Pol*. 1290ᵇ25–37.

has been said. And there is no order in the substance; for how could one understand one thing as being prior and another posterior?

As regards definitions by division, then, let this much suffice as a first statement of what they are like.

7.13
Are Universals Substances?

Since, however, it is with substance that the investigation is concerned, we should return to that. Just as the underlying subject and the essence are said to be substance, **1038**[b]**1**
so also is the universal. Two of these have already been spoken about, the essence and the underlying subject,[328] saying that it underlies in two ways, either by being a this something, as the animal underlies its affections, or as the matter underlies the actuality.[329] But the universal too seems to some people[330] to be most of all a cause, and the universal most of all a starting-point. Hence let us turn to that too. For it seems impossible for any of the things said [of something] universally to be substance.

For first the substance of each thing is special to it, in that it does not belong to anything else. A universal, by contrast, is something common; for that thing is said to be a universal which naturally belongs to many things. Of which, then, will it be the substance? For it is either the substance of none or of all. And it cannot be the substance of all. But if it is the substance of one, all the others will be this one as well; for things whose substance is one and whose essence is one are also themselves one.

Further, substance is said to be what is not said of an underlying subject, while a universal is always said of a certain underlying subject.

But perhaps the universal, while it cannot be substance in the way in which the essence is, can yet be present in it—for example, as the animal is present in the human and the horse. Clearly there is some account of it. And it makes no difference even if it is not the account of everything in the substance; for this [universal] will not be any less the substance of something, as the human is of the human in whom it is present. So the same result will again follow; for it (for example, the animal) will be the substance of that in which it is present as something special to it.

Further, it is both impossible and absurd for the this (that is, the substance), if it is composed of something, not to be composed of substances or of the this something but of a quality; for then non-substance (that is, the quality) will be prior to substance (that is, to the this). Which is precisely what is impossible; for neither in account nor in time nor in knowledge can the affections be prior to the substance; for then they will also be separable.

328. 7.3 (underlying subject), 7.4–6, 7.10–12 (essence).
329. I.e., the form.
330. Plato and the Platonists.

Further, in Socrates substance will be present, so that [the universal] will be the substance of two things.

And, in general, if the human and whatever is said of things in that way are substance, it follows that none of the things in their account is substance of any of them or is separate from them or in something else. I mean, for example, that there is not some animal, or any other of the things in the account, beyond the particular ones.[331]

If we get our theoretical grasp on the issue on the basis of these considerations, then, it is evident that nothing that belongs universally to things is substance, and that none of the things that are predicated in common signifies a this something but a such-and-such sort. If not, many other difficulties result, and especially the third man.[332]

Further, the issue can also be expressed in this way. For it is impossible for a substance to be composed of substances that are actually present in it; for things that are actually two in this way are never actually one, although if they are potentially two, they can be one (for example, the double line is composed of two half-lines, at any rate, potentially; for their actuality separates them). And so, if the substance is one, it will not be composed of substances present in it and present in the way that Democritus rightly states;[333] for he says that it is impossible for one to be composed of two or two of one; for he makes the indivisible magnitudes the substances. It is clear, therefore, that the same will hold in the case of number, if indeed number is composed of units, as some people[334] say; for two is either not a one, or there is no unit actually present in it.

But this result involves a puzzle. For if no substance whatever can be composed of universals because they signify the such-and-such sort but not this something, and if also no substance can in actuality be composed of substances, every substance would be incomposite, so that there would not even be an account of any substance whatever. But then it seems to everyone, and was stated not long ago,[335] that definition is either of substance only or of it most of all, while now it seems not even to be of it. So there will not be a definition of anything at all. Or else in one way there will be one, but in another way there will not. What is being said will be more clear on the basis of what comes later.[336]

7.14
Are Platonic Forms Separable Substances?

But it is also evident from these very considerations what the consequence is for those who say that the Forms are substances and separable, and at the same time make the

331. I.e., the particular forms.
332. F184, 83.34–85.12.

334. Perhaps Thales.
335. 1030a2–17.
336. 7.15, 8.6.

Form be composed of the kind and the differences. For if there are the Forms, and if the animal is present in the human and the horse, it is either numerically one and the same in each, or distinct. [I mean the former,] for it is clear that it is one in account; for the person giving the account will go through the same account in either case. If, then, there is some human-itself that is intrinsically a this something and separated, it is also necessary for the things from which it is composed—for example, animal and two-footed—to signify a this something and to be both separable and substances. So the animal too will be like this.

If the animal that is both in the horse and in the human is one and the same, just as you are one and the same as yourself, how will what is present in separate things be one, and why will this animal too not be separate from itself? Next, if it is to participate in two-footed and many-footed, something impossible follows; for contraries will belong to it at the same time, although it is one and a this something. But if it is not to participate in them, what way are they related when one says that the animal is two-footed or footed? Are they perhaps combined and making contact or mixed together? Yet all of these are absurd.

But suppose that the animal is a distinct thing in each, then there will be (one might almost say) an unlimited number of things whose substance is animal; for it is not coincidentally that the human is composed of animal. Further, the animal-itself will be many things; for the animal in each will be substance (for it is not with reference to anything else that it is said to *be*; but if it were, the human will be composed of that other thing, and its kind will be that). And further all the things from which the human is composed will be Forms. But nothing will be the Form of one thing and the substance of another (for that is impossible). Therefore, each of the animals present in the various [forms] of animals will be animal-itself. Further, from what is this latter one composed—that is, how is it composed of animal-itself? Or how can this animal, whose substance is this itself, be beyond the animal-itself?

Further, in the case of the perceptibles, these and even more absurd results follow. If, then, it is impossible for things to hold in this way, it is clear that there cannot be Forms of these in the way that some people say.

7.15
No Definitions or Demonstrations of What Is Particular

Since substance is in distinct ways, both as the compound and as the account (I mean that the first is substance in this way, the account combined with the matter, while the other is wholly the account), it follows that of those said to be such in the first way there is passing away (for there is coming to be as well), but there is none—in the sense of being in the process of passing away—of the account (for there is no coming to be either, for the being for house does not come to be, but the being for

this house); rather, without coming to be or passing away, they are or are not; for it has been proved[337] that no one begets or makes these.

This is also why there is neither definition nor demonstration of the substances that are perceptible and particular, because they have matter, the nature of which is such that it is capable of both being and not being (which is why all the particular ones of them can pass away). At all events, if demonstration is of the necessary things and definition is a matter of scientific knowledge, and if, just as scientific knowledge cannot be scientific knowledge at one time and ignorance at another[338] (but instead it is belief that is like that), so neither definition nor demonstration can be that way either (but instead it is belief that is of what admits of being otherwise), it is clear that there will not be either definition or demonstration of such things. For things that pass away are unclear to those who have scientific knowledge, when they have departed from perception, and, though accounts are preserved the same in their soul, there will still not be either definition or demonstration. That is why, in issues relating to definition, when someone is defining one of the particular things, we must not be ignorant of the fact that it is always possible to do away with this definition; for particulars cannot be defined.

Nor indeed can any Form be defined. For the Form is a particular, so they say, and separable.[339] But its account must be composed of names, and the definer cannot make up a name (for it would be an unknown). Yet each of the established names is common to all. Therefore, they must belong to something else too—for example, if someone were defining you, he would say that you are an animal that is thin or pale or something else that will also belong to something other than you. And if someone were to say that nothing prevents all these taken separately from belonging to many things, but that taken all at once they belong only to this one, one must say first they also belong to both components—for example, the two-footed animal belongs to animal and to two-footed.[340] In fact, in the case of the eternal things this is even necessary, because the components are prior to and parts of the composite. More than that, they are also separable, if indeed the human is separable; for either neither is separable or both are. But if neither is, the kind will not exist beyond the forms, and if it does, so will the differences. Second, they [animal, two-footed] are prior in being [to the two-footed animal]. But things that are prior to others are not done away with together with them. Again, if the Forms are composed of Forms (for the things they are composed of are less composite), it will further be necessary for the things from which the Form is composed—for example, animal and two-footed—to be predicated of many things. If not, how will they come to be known? For there will then be a Form that cannot be predicated of more than one thing. But that does not seem to be the case. On the contrary, every Form seems to admit of being participated in.

337. 7.8.
338. Cf. *APo.* 75b24–26.
339. 1078b30–32, 1086b7–11.
340. 1003a10–12.

As was said, then, the impossibility of defining [particulars] escapes notice in the case of eternal things, especially those that are unique—for example, the sun and the moon. For people err by adding the sort of things whose removal would leave it still being the sun, such as "going around the earth" or "being hidden at night" (for [this would entail] that if it stood still or was visible at night, it would no longer be the sun). But if it were not, that would be absurd (for the sun signifies a certain substance). Further, [they err not only in that way but also by mentioning] things that can belong to something else—for example, such that if a second thing of the relevant sort comes to be, it is clear that it will be a sun; therefore, the account is common to both. But the sun was supposed to be a particular, just like Cleon or Socrates. After **$1040^{b}1$** all, why is it that none of these [who believe in] Forms put forward a definition of them? For it would become clear, if they tried, that what has now been said is true.

7.16
Most Things That Seem to Be Substances Are in Fact Capacities

It is evident that even of the things that seem to be substances, most are capacities, whether the parts of animals (for none of them exists when it has been separated, and whenever they are separated they all exist only as matter) or earth, fire, and air (for none of them is one, but instead they are like a heap, until they are concocted[341] and some one thing comes to be from them).

One might most readily suppose, however, that the parts of animate things, and the parts of the soul close to them, turn out to exist in both ways, both actually and potentially, due to having starting-points of movement deriving from something in their joints—which is why some animals go on living when divided.[342] Nonetheless, when they are one and continuous by nature, rather than by force or by growing together, these will all exist potentially; for the latter sort of thing is a deformation.

But since something is said in the same ways to be one and to *be*, and the substance of what is one is one, and things whose substance is one in number are one in number, it is evident that neither one nor being can be the substance of things, just as neither being for an element nor being for a starting-point can. Rather, we look for what the starting-point of something is in order to lead the thing back to something better known. Of these, then, being and one are in fact substance to a higher degree than are starting-point, element, or cause. But not even they are substance, if indeed nothing else—nothing that is common—is either; for the substance belongs to nothing but itself and what has it, of which it is the substance. Further, what is one cannot be in many places at the same time, but what is common does belong in many places at once, so that it is clear that no universal exists separately, beyond the particulars.

341. *Mete*. $379^{b}18$–35.
342. *DA* $411^{b}19$–24, $413^{b}13$–24.

But those who accept the Forms speak correctly in one way, in separating them (if indeed the Forms are substances), but in another way not correctly, because they say that the one over many is a Form. And the cause of this is that they do not have [an account] to give of the substances that are of this sort—the imperishable ones that are beyond the particular perceptible ones. So they make them the same in form as perishable things (for these are the ones we know), man-itself and horse-itself, adding to the perceptible ones the word "itself." And yet even if we had never seen the stars they would nonetheless, I think, have been eternal substances beyond the ones we knew, so that even as things stand, if we do not grasp which ones they are, at any rate, it is presumably just as necessary that there be some.

That nothing said of things universally is substance, then, and that no substance is composed of substances, is clear.

7.17
Substance as Starting-Point and Cause

Let us make, as it were, a fresh start, and say again what, and what sort of thing, substance must be said to be; for perhaps on the basis of these considerations that substance, whatever it is, which is separated from the perceptible substances will also be clear. Since, then, substance is a starting-point and cause, one must go in search of it from there.

The why is always inquired about in this way: Why does one thing belong to a certain other? For to inquire about why the musical human is a musical human is either, as was said, to inquire about why the human is musical, or [why it is] something else. But to inquire about why a thing is itself is to inquire about nothing (for that something is the case and that it exists should [already] be clear[343]—I mean, for example, that the moon is eclipsed). But of the fact that a thing is itself there is one account and one cause in all cases, [as in] why the human is human or the musical is musical. Unless someone were to say that it is because each thing is indivisible from itself, and this is what it is for it to be one. But that, at any rate, is common to all cases and too concise.[344] One can, though, inquire about why the human is an animal of such-and-such sort. It is clear, therefore, that this is not to inquire about why he, who is a human, is a human.

It is when something is [predicated] of something, therefore, that one inquires about why it belongs to that thing (but that it does belong must be clear; for if things are not that way, there is nothing to inquire about). For example, "Why does it thunder?" is "Why is there noise in the clouds?" For this way what is being inquired about is one thing [predicated] of another. And why are these—for example, brick

343. *APo*. 93a26–27.
344. *Rh*. 1414a24–25.

and stones—a house? It is evident, therefore, that one is inquiring about the cause. This (one might almost say) logico-linguistically is the essence. But in some cases it is what the thing is for the sake of (for example, it is presumably this in the case of a house or a bed), and in some it is what first initiated the movement; for this is also a cause. But the latter is inquired about in cases of something's coming to be and passing away, while the former is inquired about also in the case of a thing's being.

What is being inquired about most easily escapes notice, however, in cases where one thing is not said of another. For example, human being, when what it is is being inquired about, it escapes notice, because it is said simply, and one does not declare **1041**^{b}**1** that these things are this. But we must divide up before inquiring. Otherwise, inquiring about nothing and inquiring about something will become joint inquiries. But since the existence [of the subject] and also the belonging [of the predicate to it] must be the case, it is clear, then, that what is being inquired about is why the matter is something. For example, why are these things a house? Because the being for house belongs to them. Why is this—or rather this body in this state—a human being? So what is being looked for is the cause in virtue of which the matter is something. But this is the substance.

It is evident, therefore, that in the case of things [said] simply there is neither inquiry nor teaching, but instead another way than inquiry belongs to them.[345]

What is composed of something in such a way that the totality is one is not like a heap but like a syllable. But the syllable is not its phonetic elements (BA is not the same as B and A), nor is flesh the same as fire and earth; for when they—for example, the flesh and the syllable—are dissolved they no longer exist, while the phonetic elements do exist, and so do the fire and the earth. Therefore, the syllable is not only its phonetic elements (the voiced [= A] and the unvoiced [= B]), but also something else. And the flesh is not only fire and earth, or the hot and the cold, but also something else. Therefore, if that thing must be either an element or composed of elements, then, if it is an element, the same argument will apply again. For the flesh will be composed of this and fire and earth, and something else again, so that the process will go on without limit. But if it is composed of an element, it is clear that it must be not composed only of one but of more than one, or else that one will be the thing itself, so that again in this case we can state the same argument as in the case of the flesh and syllable. But it would seem to be something, and not an element, and a cause in fact of this being flesh and this being a syllable. And similarly in the other cases. This is the substance of each thing; for it is the primary cause of their being.

Since, while some things are not substances, all the ones that are substances are composed in accord with nature and by nature, this nature would seem to be their substance, which is not an element but a starting-point. An element, by contrast, is what a thing can be divided into and which is present in it as matter—like the A and the B of the syllable.

345. 1051^{b}17–1052^{a}4.

BOOK 8 (ETA)

8.1
Summary of Book 7

1042ᵃ1 After having recapitulated what has been said, then, and having concluded the main point, we must add an end.

It was said,[346] then, that the inquiry is into the causes, starting-points, and elements of substances. And, as for substances, some are agreed on by all, while others have been advocated by certain people on their own behalf. The agreed-on ones are the natural ones—for example, fire, earth, water, air, and the other simple bodies, then plants and their parts, the animals and the parts of the animals, and finally the heaven and the parts of the heaven—while some people say[347] on their own behalf that the Forms and the objects of mathematics are substances. But it follows from the arguments that there are other[348] substances: the essence and the underlying subject. Further, in another way the kind is more substance than the various forms, and the universal than the particulars. And with the universal and the kind the Forms are closely connected (for it is in accord with the same argument that they seem to be substances). And since the essence is substance, and a definition is an account of the essence, that is why definition and what is intrinsic were discussed. And since the definition is an account, and the account has parts, it was also necessary to see in the case of a part what sorts are parts of the substance and what sorts are not, and whether these are parts of the definition too. Further, neither the universal nor the kind is substance. And as for the Forms and the objects of mathematics, they must be investigated later on;[349] for some say that these are substances that are beyond the perceptible ones.

But now we should review the agreed-on substances. These are the perceptible ones. And the perceptible substances all have matter. The underlying subject is substance, and in one way this is the matter (by "the matter" I mean what, though not actively a this something, is potentially a this something); in another way, it is the account and the shape, which being a this something is separable in account; and in a third way, what is composed of them, of which alone there is coming to be and passing away, and which is unconditionally separable; for of substances that are in accord with the account some are separable and some are not.[350]

But that matter too is substance is clear; for in all changes from one opposite to another there is something that underlies the changes. For example, in change in

346. 982ᵃ1–6, 1025ᵇ3–7, 7.17.
347. 7.2.
348. Reading ἄλλας.
349. Books 13 and 14.
350. 1017ᵇ24–26, 1035ᵇ14–31, 1037ᵃ5–10.

place, there is what is now here and later on there; in change in growth, there is what is now one size and later on larger or smaller; in change involving alteration, there is what is now healthy and then again sick; and similarly in change in substance, there is what is now coming into being and later passing away, and now is underlying **1042**^{b}**1** subject as a this something and then again as being so as a privation. The other sorts of changes follow along, then, with this sort, but this one does not follow along with either one or both of the others; for if a thing has matter for change of place, it is not necessary that it also have it for coming to be and passing away.

What the difference is between unconditional coming be and coming to be that is not unconditional has been stated in our studies concerning nature.[351]

8.2
Substance as Activation of Perceptibles

Since substance as underlying subject and as matter is generally agreed on, and this is what is potentially [something], it remains to say what substance—as activation—of the perceptibles is.

Democritus,[352] for his part, seems to think that there were three differences; for he thinks that the underlying body and the matter are one and the same, but that it is differentiated either by rhythm (that is, shape), or by turning (that is, position), or by contact (that is, order). It is evident, however, that there are many differences. Some things are said to *be*, for example, due to the mode of composition of their matter, like those said to *be* due to blending (such as honey-water), or due to tying (such as a bundle), or due to gluing (such as a book), or due to nailing (such as a box), others due to more than one of these. Others are said to *be* due to position—for example, a threshold or a lintel (for these differ due to how they are placed); others due to time (such as dinner and breakfast); others due to place (such as the winds); and others due to the affections [special] to perceptibles (such as hardness and softness, density and rarity, dryness and wetness), some due to some of these, others due to all—and in general, some due to excess, some to deficiency.

So it is clear that something is said to *be* in that many ways too; for a threshold *is* because it is placed thusly, and the being for a threshold signifies its being placed thusly, and the being for ice signifies its being solidified thusly. And in some cases their being will even be defined by all of these, due to some parts being mixed, some blended, some bound, some solidified, and some making use of the other differences, as do hand and foot.[353]

It is necessary, then, to get hold of the kinds of differences (for these are going to be starting-points of the being)—for example, those differentiated by the more and

351. *Ph.* 225^{a}13–20.
352. 985^{b}4–10.
353. *HA* 486^{a}14–^{b}22.

less, or by dense and rare, or by others of this sort; for all these are excess and deficiency. And if something is differentiated by shape, or by smoothness and roughness,[354] all these are differentiated by straight and curved. And for other things being is being mixed and not being is the opposite. From these cases, then, it is evident—if indeed the substance is the cause of each one's being—that it is in these differences that one must look for what the cause is of the being of each of them.

None of these differences is substance, not even when it is coupled [with matter]; nonetheless, in each case it is the analog. And just as in substances what is predicated of the matter is the activation itself, so in the other definitions too it is what is most of all this. For example, if one had to define a threshold, one would say wood or stone placed this way; and a house, bricks and timbers placed this way (or, again, in some cases the for-the-sake-of-which is included too); and if ice, water frozen or solidified this way; and concord, high and low mixed such-and-such a way. And it is the same in the other cases. It is evident from these things, then, that the activation of one matter is different from that of another, and so is the account; for of some things, it is the mode of composition, of others the mixing, and of others some other of the things mentioned. That is why of those who give definitions, the ones who in saying what a house is say that it is stone, bricks, and timbers are speaking of what is potentially a house, for these things are matter. Those who propose[355] that it is a receptacle to shelter property and bodies, or something else of this sort, are speaking of the house in activation.[356] But those who combine both of these speak of the third sort of substance, the one composed of them (for it seems that the account given in terms of the differences[357] is of the form and the activation, while the one that is composed of the constituents is an account of the matter instead). And similarly for the sorts of definitions that Archytas used to accept; for they are of both combined. For example, what is stillness? Quietness in a large quantity of air. The air is matter; the quietness is activation and substance. What is a calm? Smoothness of sea.[358] The underlying subject as matter is the sea; the activation and the shape is the smoothness.

It is evident, then, from what has been said, what perceptible substance is, and the way it is; for there is one as matter, one as shape and activation, and one composed of these.

8.3
Composite Substances versus Their Activations

But one should not be ignorant of the fact that sometimes it escapes notice whether the name signifies the composite substance or the activation and the shape—for

354. *Cat.* 10a22–24.
355. Reading προτιθέντες.
356. Reading ἐνεργείᾳ.
357. 1038a18–28.
358. *Top.* 108b23–26.

example, whether house is a sign for the joint thing, because it is a covering composed of bricks and stones placed this way, or for the activation and the form, because it is a covering, or whether a line is a two in length or a two, or whether an animal is a soul in a body or a soul; for soul is substance and activation of a certain sort of body.[359] Animal might in fact be applied to both, not as something said in one account, but rather with reference to one thing. But though this makes a difference in relation to another issue, in relation to our inquiry into perceptible substance it makes none; for the essence belongs to the form and the activation. For a soul and being for a soul are **1043^{b}1** the same, but being for a human and a human are not the same, unless the soul too is also going to be said to be a human—in which case, in one way they are the same, in another way not.

It is evident, then, to those who investigate it, that the syllable is not composed of the phonetic elements plus a mode of composition, nor is the house bricks plus a mode of composition. And this is correct; for neither the mode of composition nor the mixing is composed of the things of which it is a composition or a mixing. And similarly in the other cases. For example, if the threshold is such by position, the position is not composed of the threshold, but rather the latter of the former. Nor indeed is the human the animal plus two-footed, but there must be something else beyond these, if these are matter—something that is neither an element nor composed of elements, but is rather the substance. And it is once people do away with this that they state only the matter. If, then, this is cause of the being, and if this is substance, they will not be stating[360] the substance itself.

(This substance, then, must either be eternal or it must be capable of passing away without being in the process of passing away, and must have come to be without [ever] being in the process of coming to be. And it has been proved and made clear elsewhere[361] that no one makes or begets the form, but instead it is a this that is made, and the thing composed of [matter and form that] comes to be. As to whether the substances of things that can pass away are separable, nothing is yet clear—except that it is clear that it is impossible in some cases, those where it is impossible for them to be beyond the particular instances, like a house or a tool. Perhaps, then, neither these nor any of the other things that are not composed by nature are substances at all; for one might assume that the nature is the only substance found in things that can pass away.)

So the puzzle that the followers of Antisthenes[362] and similarly uneducated people used to puzzle over has a certain timeliness, namely, that it is impossible to define the what-it-is (for a definition is a "long story"), although it is actually possible to teach people what sort of thing it is.[363] For example, silver—what it is one cannot say, but

359. *DA* 412^{a}19–28.
360. Reading οὐ λέγοιεν.
361. 7.8.
362. 1024^{b}32.
363. Rejecting the seclusion of καὶ and the addition of ὁρίσασθαι δ'οὔ.

that it is like tin, one can say. So of one sort of substance there can be a definition and an account, the compound sort, whether perceptible or intelligible, but of the primary parts of which this is composed, there cannot be any, if indeed the definitional account signifies something [predicated] of something, and one must play the part of matter and the other of shape.

It is also evident why, if indeed substances are in a way numbers, they are so in this way and not, as some people say, as numbers of units; for a definition is a sort of number; for it is divisible, and indeed into indivisibles (for accounts are not unlimited), and number is like that. And just as when one of the parts of which a number is composed is subtracted from or added to the number, it is no longer the same number but a different one, even if it is the very smallest part that has been subtracted or added, so too neither the definition nor the essence will any longer be the same if anything is subtracted or added. And in fact the number must be what makes something one, though they cannot now say what makes it one, if indeed it is one (for either it is not one, but rather a sort of heap, or if indeed it is one, one must say what it is that makes it one from many). The definition is also one, but they likewise cannot say what makes it one either. And this result makes perfect sense; for the argument is the same [in both cases].

The substance is also one in this way, and not—as some say—by being a sort of unit or point, but rather each is an actuality and a sort of nature. And just as number does not admit of the more and less, neither does the substance that is in accord with the form, but if indeed any does it is the one with the matter.

Concerning the coming to be and passing away of what are said to be substances, then, and in what way it is possible and in what way not, and concerning the leading back of things to numbers, let this much be determined.

8.4
The Matter of Composite Substances

As regards material substance, one should not overlook the fact that even if all things come from the same primary thing or from the same things as primary, and even if the same matter serves as starting-point for the things that come to be, nonetheless there is a sort that properly belongs to each—for example, to phlegm, it is the sweets and the fats; to bile, it is the bitter or some other things. But perhaps these come from the same thing. And there come to be several matters for the same thing when the one is matter for the other—for example, phlegm comes from the fat and the sweet if the fat comes from the sweet. But it comes from bile by the analysis of the bile into its primary matter. For one thing can come from another in two ways, either because it will be found further down the road or because it will be found if the other is analyzed to its starting-point.

It is possible for things, though their matter is the same, to come to be different because of the moving cause—for example, both a box and a bed can be made of wood. But of some things, because they are different, the matter is of necessity different—for example, a saw could not come to be of wood, nor can the moving cause bring this about; for it could not make a saw of wool or wood. Therefore, if indeed the same thing can be made of different matter, it is clear that the craft—that is, the starting-point, the mover—must be the same; for if both the matter and the mover are different, so is the thing that comes to be.

When one is inquiring about the cause, then, one should—since things are said to be causes in many ways—state all the possible causes. For example, of a human, what is the cause as matter? The menses? What is it as mover? The seed? What is it as the form? The essence. What is it as the for-the-sake-of-which? The end. Perhaps, though, these last two are the same.[364] But it is the closest causes that should be stated. For example, what is the matter? Not fire or earth but the one that is special.

As regards substances that are natural and that come to be, then, it is necessary to proceed in this way if one is to proceed correctly—if indeed the causes are these and this many, and it is the causes that one needs to know. But in the case of the natural but eternal substances another account is needed. For perhaps some have no matter, or not matter of this sort but only matter for movement with respect to place. Nor is there matter for those things that are indeed by nature but are not substances, where instead the substance is the underlying subject. For example, what is the cause of an eclipse? What is its matter? In fact, there is none. Instead, the moon is what suffers [the eclipse]. And what is the cause as moving and extinguishing the light? The earth. As for the for-the-sake-of-which, perhaps there is not one. And the cause as form is the account. But this is unclear unless it involves the [moving] cause. For example, what is an eclipse? Lack of light. But if one adds "as a result of the earth coming in between," then this is the account that involves the cause.[365]

In the case of sleep,[366] however, it is not clear what the primary thing is that is affected. Is it the animal? Yes, but the animal with respect to what, and to what primary thing? The heart or something else. Then, as a result of what? Then, what is the affection (that of the primary thing, not of the whole)? Such-and-such sort of immobility? Yes, but to what affection of the primary thing is this due?

8.5
How the Matter of a Thing Is Related to Its Contrary States

Since some things are and are not without coming to be or passing away—for example, points, if indeed they *are*, and in general, the forms (for it is not the pale that

364. *Ph.* 198^{a}25–27.
365. *APo*. 93^{a}28–^{b}7.
366. *Somn*. 456^{b}17–28.

comes to be but the wood that comes to be pale, if everything that comes to be comes to be from something and comes to be something), not all contraries could come to be from each other, but rather a pale human comes from a dark human, and pale from dark, in different ways. Nor does everything have matter, but only those things that come to be and change into one another. But those that are or are not without such changing have no matter.

There is a puzzle about how the matter of a given thing is related to its contrary states—for example, if the body is potentially healthy, and disease is contrary to health, is the body both potentially healthy and potentially diseased? And is the water potentially wine and potentially vinegar? Or is it rather the matter of one in virtue of its state and its form, and of the other in virtue of the privation and the passing away of its state and form contrary to nature?

There is also a certain puzzle as to why the wine is neither matter of the vinegar nor potentially vinegar, and yet vinegar comes to be from it, and why the living being is not potentially a corpse. Or is it not rather that these passings away are coincidental? And it is the matter of the live animal that is, in virtue of its passing away, itself a potential corpse and matter of a corpse, and the water of vinegar; for they come to be from these just as night does from day. And things that change into one another in this way, then, must revert to their matter—for example, if a live animal were to come to be from a corpse, the corpse would have to first revert to its matter, and then in this way become an animal, and the vinegar would have to revert to water and then in this way become wine.

8.6
What Makes a Definiens or a Definiendum One

Let us now consider the puzzle stated previously about definitions and about numbers: What is the cause of their being one? For of all things that have several parts and where the totality of them is not like a heap, but the whole is something beyond the parts, there is some cause of it, since even among bodies, in some cases contact is the cause of their being one, in others stickiness, or some other affection of this sort. A definition, however, is an account that is one not by conjunction, like the *Iliad*, but by being of one thing. What is it, then, that makes the human one, and why one and not many—for example, both animal and two-footed? Especially, of course, if, as some people say, there is some animal-itself and some two-footed-itself? For why are those things-themselves not the human (so that humans would be [what they are] by participation not in human, nor in one thing, but in two, animal and two-footed, and in general, then, the human would be not one but more than one, animal and two-footed)?

It is evident, then, that if people proceed in this way—as they usually do—to define and speak, it is not possible to give an answer and solve the puzzle. But if,

as we say, there is, on the one hand, matter and, on the other, shape, and the one is potentially and the other actively, what is being inquired about will no longer seem to be a puzzle. For this puzzle is the same as would arise if the definition of cloak were round bronze; for then this name would be a sign of the account, so that the subject of inquiry is what is the cause of the round and the bronze being one? There no longer appears to be a puzzle, then, because the one is matter, the other shape. So what is the cause of this—of what is potentially being so actually—beyond what produces it (in the case of things where there is a process of coming to be)? For there is no other cause of what is potentially a sphere being actively a sphere; rather, this was the essence for both of them.

Of matter, there is some that is intelligible and some that is perceptible, and one part of the account is always the matter and the other the activation—for example, the circle is shape plus plane. But each thing that has no matter, whether intelligible or perceptible, is from the outset precisely what is a one, just as it is also from the outset precisely what is a being—a this, a quality, a quantity. That is also **1045^{b}1** why neither being nor one is present in their definitions. Also, the essence is from the outset a one, just as it is from the outset a being. And that is why there is no other thing that is the cause in the case of any of these things either of their being one or of their being; for each of them is from the outset a being and a one, and not because they are in being-kind and one-kind, nor as separable beings beyond the particulars.

It is because of this very puzzle, however, that some people speak of participation and puzzle over what the cause of participation is and what it is to participate. Others, however, speak of communion, as Lycophron says that scientific knowledge is a communion between scientifically knowing and soul, while others say that living is a composition, or conjunction, of soul with body. And yet the same account applies to all cases; for something's being healthy will also be either a communion, a conjunction, or a composition of soul and health, and the bronze's being a triangle will be a composition of bronze and triangle, and something's being pale will be a composition of surface and paleness. The cause of this is that they look for an account of potentialities and actualities that makes them one, and for a difference [between them].

But in fact, as was said,[367] the ultimate matter and the shape are one and the same, the one potentially, the other actively, so that it is the same thing to look for what is the cause of oneness and what is the cause of being one; for each thing is a one, and what potentially is and what actively is are in a way one. So there is no other cause here, unless there is something that brought about the movement from potentiality to activity. But things that have no matter are all unconditionally precisely what is a one.

367. 1045^{a}23–33.

BOOK 9 (THETA)

9.1
Potential Being (Capacities)

Primary being, then, that to which all other categories of being are referred back, has been spoken about, namely, substance (for it is in accord with the account of the substance that the others are said to *be*—that is, quality, quantity, and the others that are said to *be* in this way; for they will all include the account of the substance, as we said in the first discussions[368]). But since something is said to *be*, on the one hand, by being a what or a quality or a quantity, and, on the other, with respect to potentiality and actuality and in accord with the work,[369] let us also make some determinations about potentiality and actuality—and first about what is said to be a potentiality in the strictest sense, even though it is not the most useful for what we wish to investigate now;[370] for potentiality and activity extend more widely than those cases that are said to be such only with reference to movement. When we have spoken about it,[371] we will, in the determinations we make concerning activity,[372] also make clear the others.

We determined in another discussion[373] that something is said to be a capacity and to be capable in many ways. Among these, the ones that are said to be capacities homonymously may be left aside (for some are said to be such because of some similarity, as in geometry[374] we say that things are powers or non-powers because of being or not being in some way). But those that are said to be capacities in relation to the same form are all starting-points, and are said to be capacities with reference to one that is primary, which is a starting-point of change in another thing or in itself insofar as it is other.[375] For one sort is a capacity to be affected, the starting-point in the thing itself of being affectively changed by another thing or by itself insofar as it is other. Another sort is the state of being unaffectable (leading to the worse and to passing away) by another thing, or by itself insofar as it is other, in virtue of a starting-point of change. For present in all these definitions is the account of the primary capacity. Again, things are said to have these capacities merely because of acting or being affected or because of acting or being affected well, so that even in the accounts of the latter the accounts of the former capacities are in a way present.

368. 1003b16–19, 1028a10–20, 1029a12–16, 1030a28–b7.
369. 1050a21–23.
370. I.e., whether there is any substance that is separate. See 1028b30.
371. 9.1–5.
372. 1048a27–b6.
373. 5.12.
374. 1019b33–34.
375. *Ph.* 192b21–27.

It is evident, then, that in a way the capacity to act and to be affected are one (for something is capable either by itself having a capacity to be affected or by another thing having the capacity to be affected by it), while in another way they are distinct. For the one capacity is in what is affected (for it is because it has in it a certain starting-point, and because the matter too is a certain starting-point, that what is affected is affected, and that one thing is affected by another; for what is oily is burnable, what yields in this specific way is crushable, and similarly in the other cases), while the other capacity is in what acts—for example, heat or the craft of building (the one in what is capable of heating, the other in what is capable of building). That is why, insofar as it is naturally unified, nothing is affected by itself; for it is one, and not other.

And incapacity and being incapable are the privation that is contrary to this sort of capacity, so that every capacity is for the same thing and in the same respect as the corresponding incapacity. But something is said to be a privation in many ways; for there is what does not have something and what is naturally suited to have something but does not have it, either at all or when it is natural to have it, and either in this specific way (for example, completely) or even in any way whatever. In some cases, though, where things that are naturally suited to have something do not have it due to force, we say that they have been caused to be deprived of it.

9.2
Rational and Non-rational Capacities

Since some starting-points of these sorts are present in inanimate things, others in animate ones, and in a soul, and in the part of the soul that has reason, it is clear that some of the capacities will be non-rational, while some will involve reason. That is why all the crafts—that is, all the productive sciences—are capacities; for they are starting-points of change in another thing or in the same thing insofar as it is other.

And all the capacities that involve reason are such that the very same one is a capacity for contraries, while the non-rational ones are such that one capacity is for one of them—for example, the hot is for heating only, but the craft of medicine is for both disease and health.[376]

The cause of this is that scientific knowledge is an account, and the same account makes clear both the positive thing and its privation, except not in the same way—that is, in a way it is of both, but in a way it is rather of the positive thing. And so it is also necessary that these sorts of sciences should be of contraries, but of one intrinsically and of the other non-intrinsically; for the account too is of one intrinsically and of the other, in a way, coincidentally; for it is by negation and removal that it makes

376. 1048^{a}10–15.

the contrary clear; for the contrary is the primary privation, and this is the removal of the other [and positive] contrary.

Since contraries do not occur in the same thing, and scientific knowledge is a capacity by having an account, and the soul has a starting-point of movement, it follows that while what is healthy produces only health, and what is capable of heating produces only heat, and what is capable of cooling produces only cold, the person with scientific knowledge can produce both of the relevant contraries. For the account is of both, though not in the same way, and it is in a soul that has a starting-point of movement, so that the soul will move both of the relevant contraries from the same starting-point, having connected them to the same account. That is why things that are capable in accord with an account—in contradistinction to the ones capable without an account—produce contraries; for they are encompassed by one starting-point, the account.

It is also evident that while the capacity merely to act or to be affected follows along with the capacity to do so well, the latter does not always follow along with the former; for someone who does something well must of necessity also do it, but someone who merely does something need not of necessity also do it well.

9.3
The Megarians on Capacities

There are some people—for example, the Megarians—who say that a thing is capable of something only when actively doing it, and that when not actively doing it, it is not capable—for example, someone who is not building is not capable of building, but someone who is building is capable if and when he is building, and similarly in the other cases. But that the consequences of this are absurd is not difficult to see. For it is clear that someone will not even be a builder unless he is building (for to be a builder is to be capable of building), and similarly in the case of the other crafts. So if it is impossible to possess such crafts without at some time having learned and grasped them, and impossible not to possess them without having at some time lost them—either by forgetting them or by being affected in some way or due to time (for of course it cannot be due to the passing away of the thing;[377] for it always is)—then whenever someone has stopped [building], he will not possess the craft. And if he will at once start building again, how will he have [re-]grasped it?

Inanimate things too are the same way; for there will be no cold or hot or sweet or, in general, anything perceptible, if nothing is perceiving them, so that the supporters of this view will have to give the argument of Protagoras.[378] But in fact nothing will even have perception if it is not perceiving and actively so. If, then, something is

377. I.e., the object of scientific knowledge, which, as a universal, cannot pass away.
378. 1009a6–16.

blind if it does not have sight (though it is natural that it should have it) when it should naturally have it, and further, in the way it should naturally have it, the same people will be blind many times in the day—and deaf too.

Further, if what is lacking capacity is incapable, what is not happening will be incapable of happening. But someone who says of what is incapable of happening that it either is or will be says something false (for this is what incapable signified). So these arguments do away with both movement and coming to be. For what is standing will always be standing and what is sitting will always be sitting; for if it is sitting it will not get up; for what does not have the capacity to get up is incapable of getting up. So if one cannot say these things, it is evident that capacity and activity are distinct. (For those arguments make capacity and activity the same, which is why it is no small thing that they are looking to do away with.) So it is possible for something to be capable of being and yet not be, or capable of not being and yet be, and similarly for the other categories—to be capable of walking and yet not walk, and to be capable of not walking and yet walk. A given thing is capable if nothing impossible follows from the assumption that the activity it is said to have the capacity for belongs to it. I mean, for example, if a thing is capable of sitting and it is possible for it to sit, if sitting should belong to it, there will be nothing impossible occurring. And similarly if it is capable of being moved or moving, of standing or making something stand, of being or coming to be, or of not being or not coming to be.

The name "activity," which is connected to actuality, has been extended to other things from applying most of all to movements; for activity seems most of all to be movement, which is why people do not assign movement to non-beings, although certain other predicates they do—for example, non-beings are objects of thought and of appetite, but are not moving, and that is because, if they were, while not actively being, they would actively be. For among non-beings, some are potentially, although they are not, because they actually are not. **$1047^{b}1$**

9.4
Capacities and Incapacities

If, as was said,[379] something is capable insofar as an impossibility does not follow,[380] it is evident that it cannot be true to say that a given thing is capable of being but will not be, so that one thereby escapes the conclusion that there are impossible things. I mean, for example, suppose someone—someone who is not rationally calculating that it is incapable of being so—were to say that the diagonal of the square is capable of being measured, although it will not be measured, on the grounds that nothing prevents something from being capable of being or of coming to be that neither is nor is going to

379. $1047^{a}24–26$.
380. Reading ᾧ ἀδύνατον μὴ ἀκολουθεῖ.

be. But, on the basis of the things proposed, what is necessary is this, that if we were to assume something to be or to have come to be that is not, but that is capable of being, there will be nothing impossible in this; but it *will* turn out that there is something impossible; for the diagonal is incapable of being measured. For what is false and what is impossible are certainly not the same; for that you are standing now is false, but not impossible.

At the same time, however, it is also clear that if when A is the case it is necessary that B is the case, if A is possible, it is necessary that B is possible too; for suppose it is not necessary that it is possible, then nothing prevents it from being impossible. So, let A be possible. Then, when A is possible, if A is posited as being the case, nothing impossible follows, and so of course it is also necessary for B to be the case. But B was supposed to be impossible. Let it be impossible, then. If, then, A is impossible, it is necessary that B is too.[381] But the first was supposed to be possible,[382] therefore so is the second. Therefore, if A is possible, B will also be possible—if indeed they are so related that if A is, then B must be. If, then, when A and B are related in this way, B is not possible in the specified way, A and B will not be related as posited either. And if when A is possible it is necessary that B is possible, then if A is the case, it is also necessary that B is the case. For that B is of necessity possible if A is possible signifies this, that if ever A were the case, both when and in the way that it was supposed to be possible for it to be, then it is necessary for B to be the case at that time and in that way too.

9.5
Capacities and Their Acquisition; Rational Capacities

As all capacities are either innate, like the perceptual modalities, or come by habit, like that of pipe playing, or by learning, like that of the crafts, in the case of some of them prior activation is necessary for their possession, namely, those that come by habit or by reason, but for those that are not of this sort, or those dealing with being affected, this is not necessary.

Since what is capable is capable of something, at some time, in some way (and **1048a1** however many other things must be present in the definition), and since some things are capable of producing movement in accord with reason and their capacities involve reason, while others are non-rational and their capacities non-rational, and the rational capacities must be in an animate thing, while the non-rational ones can be in both an animate thing and in an inanimate one, with the non-rational capacities, whenever what is capable of acting and what is capable of being affected meet up in the way appropriate to the capacity in question, it is necessary for the one to act and

381. Reading τὸ A, ἀνάγκη καὶ τὸ B εἶναι.
382. Reading δυνατόν.

for the other to be affected, but with the rational capacities it is not necessary; for all these non-rational capacities are such that one is productive of one thing, while the rational capacities are productive of contrary ones, so that [if they produced them in the way the non-rational ones do] they would produce contraries at the same time; but this is impossible.

There must, therefore, be something else that is the controlling factor. I mean by this desire or deliberate choice. For whichever of two alternatives an agent desires in a controlling way, this it will do, whenever it is such as to be capable and meets up with what is capable of being affected. So whenever anything that is capable in accord with reason desires what it has a capacity for, in the way in which it has the capacity, it is necessary for it to do this. And it has the capacity for that thing in that way whenever the thing affected is present and in the relevant condition, and if not, it will not be capable of acting (for it is not further necessary to add to the definition "provided nothing external prevents it"; for it has the capacity as a capacity to act, not in all circumstances, but under certain conditions, among which will be the exclusion of external things preventing it; for these are precluded by some of the things present in the definition). That is why even if someone has a wish or an appetite to do two things or contrary things at the same time, he will not do them; for it is not in this way that he has the capacity for them, nor is it a capacity to do them at the same time, since it will do the things for which it is the capacity in the way in which it is the capacity.

9.6
Being as an Activity; What an Activity Is

Since the capacity [or potentiality] that is said of things with reference to movement has been spoken about, let us make some distinctions concerning activity, both concerning what it is and what sort of thing it is. For the capable too will at the same time become clear as we make our determinations, because we do not say only of what naturally moves something else, or is moved by something else, that it is capable, whether unconditionally or in a certain way, but also use the term in a different way, which is why in the course of our inquiry we went through the former.[383]

Activity, then, is the existence of the thing not in the way in which we say that it exists potentially. And we say, for example, that Hermes exists potentially in the wood and the half-line in the whole, because it could be abstracted from it, and that even someone who is not contemplating is a scientific knower if he is capable of contemplating; other things exist actively.

What we wish to say is clear from particular cases by induction, and we must not look for a definition of everything, but be able to comprehend the analogy, that it is

383. 1045[b]35–1046[a]4.

as what is building is in relation to what is capable of building, and what is awake is
1048b1 in relation to what is asleep, and what is seeing is in relation to what has its eyes closed but has sight, and what has been shaped out of the matter is in relation to the matter, and what has been finished off is to the unfinished. Of the difference exemplified in this analogy let the activity be marked off by the first part, the potentiality by the
5 second. But things are said to actively *be*, not all in the same way, but by analogy—as this is in this or to this, so that is in that or to that; for some are as movement in relation to a capacity [or a potential], and the others as substance to some sort of matter.

But the unlimited, the void, and things like that are said to *be* potentially or
10 actively in another way from many of the other beings[384]—for example, from what sees or walks or is seen. For the latter things can sometimes also be truly said to *be* unconditionally[385] (for what is seen [is said to be seen], on the one hand, because it is being seen and, on the other, because it is capable of being seen). But the unlimited is potentially, not in this way, that it will be actually separable, but in knowledge. For
15 it is by the division's not coming to an end that the unlimited's potential being allows this activity, not by the unlimited's being separated.[386]

Of the actions that have a limit none is an end, but all are in relation to an end—for example, making thin. For the things themselves, when one is making them thin,
20 are in movement in this way, that what the movement is for the sake of does not yet belong to them. Hence these [movements] are not cases of action, not of complete action, at any rate; for none is an end; but the sort in which the end belongs really is an action. For example, at the same time one is seeing a thing and has seen it, is thinking something and has thought it, is understanding something and has understood it, while it is not the case that at the same time one is learning something and has learned it, nor that one is being made healthy and has been made healthy. Someone
25 who is living well, however, at the same time has lived well, and is happy and has been happy. If this were not so, these would have to come to an end at some time, as when one is making something thin. But as things stand it is not so, but one is living and has lived. Among these, then, one sort should be called "movements" and the other "activities." For every movement is incomplete[387]—for example, making thin, learning, walking, building. These are movements and are certainly incomplete. For it
30 is not the case that at the same time one is walking and has taken a walk, nor that one is building something and has built it, or is coming to be something and has come to be it, or is being moved in some way and has been moved in that way, but they are different, as are one's moving and having moved something.[388] By contrast the same thing at the same time has seen and is seeing, is understanding and has understood. The latter sort, then, I call an "activity," the former a "movement."

384. Reading ἢ πολλοῖς τῶν ὄντων.
385. I.e., what they actively or actually are.
386. Reading τῷ . . . τῷ. . . .
387. *DA* 431a6–7.
388. Retaining καὶ κινεῖ καὶ κεκίνηκεν.

What actual being is, then, and what sort of thing it is, should be clear to us from these and other similar considerations.

9.7
When a Thing Is Potentially Something

But when a given thing is potentially something, and when it is not, must be determined; for it is not potentially something at just any time whatever. For example, is earth potentially a human? Or is that not so, but rather when it has already become **1049ª1** seed, and perhaps not even then? It is just like the way not everything can be made healthy, whether by the craft of medicine or by luck; rather, there is a certain sort of thing that is capable of being made healthy, and this is what is potentially healthy. And the defining mark of what, as a result of thought, comes to be actual from what is potential is that, when it is wished for, it comes about if nothing external prevents it, while on the other side—in what is being made healthy—it is when nothing in it prevents it. It is the same way with what is potentially a house: if none of the things in this—that is, in the matter—prevents it from coming to be a house, and if there is nothing which must be added, subtracted, or changed, this is potentially a house, and the same is true for each of the other things for which the starting-point of coming to be is external.

And for the things, then, that have the starting-point within themselves, each is potentially each of the things—if nothing external prevents it—that will come to be because of itself; for example, the seed is not yet potentially a human (for it needs to be placed in something else[389] and to change), but when, because of a starting-point that belongs to itself, it is already in the latter state—it is already potentially human. The seed, though, needs another starting-point, just as earth is not yet potentially a statue (for it is after having changed that it will be bronze).

It seems that when we say that something is not this, but rather thaten[390]—as, for example, we say that a box is not wood but wooden, and the wood not earth but earthen, and again with earth if it is similarly not another this, but rather thaten—the latter is always unconditionally the next one up potentially. For example, the box is not earthen nor earth but wooden; for wood is potentially a box and this is matter of a box—the wood unconditionally of the box unconditionally, and of this box, this wood. But if there is something primary that is no longer said to be thaten with reference to something else, this is prime matter—for example, if earth is [not air but] airen, and air is not fire but firen, fire is prime matter, since it is not a this something.[391]

389. Reading δεῖ γὰρ ἐν ἄλλῳ πεσεῖν. I.e., in the menses that will constitute the body of the emerging fetus.
390. $1033^{a}7$.
391. Because it is not composed of some further matter.

For the that of which [something is said], or the underlying subject, differs in this way, by being or not being a this something. The underlying subject for affections is, for example, a human, both body and soul, while the affection is the musical or the pale (but when music is present in it, the thing is said to be not music but musical, and the human not paleness but pale, and not a walk or a movement but walking or moving, as with thaten). In cases like this, then, the ultimate underlying subject is substance. But in cases that are not like this, but where what is predicated is a form and a this something, the ultimate underlying subject is matter and material substance. And so it quite correctly turns out that things are said to be thaten both with reference to their matter and to their affections; for both are indefinite.

When something must be said to be potentially something, then, and when not, has been stated.

9.8
The Priority of Activity to Potentiality

Since it has been determined[392] in how many ways things are said to be prior, it is evident that activity is prior to potentiality. I mean by "potentiality" [or "capacity"] not only that defined sort that is said to be a starting-point of change in another thing, or [in something] insofar as it is other, but also, in general, all starting-points of change or remaining at rest. For nature is also in the same kind as potentiality; for it is a starting-point of movement—not, however, in another thing but in the thing itself insofar as it is itself. To all this sort of potentiality, then, activity is prior both in account and in substance, while in time it is prior in one way and in another not.

But that it is prior in account is clear; for what is in the primary way potential is potential because it admits of becoming active—for example, by "capable-of-building" I mean what is capable of [actively] building, and by capable-of-seeing what is capable of [actively] seeing, and by capable-of-being-seen what is capable of [actively] being seen; and the same account also applies in the other cases, so that it is necessary for the account and the knowledge of the one to precede the account and knowledge of the other.

In time activity is prior in this way: the active that is the same in form, though not in number, is prior. I mean this, that to this human who is already actively what he is, and to the wheat and to what is actively seeing, the matter and the wheat and the capable-of-seeing, which are potentially a human and wheat and seeing, but not yet actively so, are prior in time. Prior in time to these, however, are other things that are actively what they are, from which these came to be; for what is actively always comes to be from what is potentially, as a result of what is actively (for example, human comes from human, musician as a result of musician), there being always a first

392. 5.11.

mover; and the [first] mover already is actively. And it was stated[393] in the accounts concerned with substance that everything that comes to be, comes to be something, from something, and as a result of something, and this is the same in form as it.

That is also why it seems impossible for someone to be a builder if he has built nothing or a harpist if he has never played the harp; for someone who learns to play the harp learns to play the harp by playing the harp, and similarly too for the other people. It is from this that the sophistical refutation arises, that someone who does not have scientific knowledge will be doing what the scientific knowledge is knowledge of;[394] for someone who is learning does not have it. But because something of what is coming to be must have come to be, and in general, something of what is moving must have moved (this is made clear in the discussions concerning movement), the one who is learning too must presumably have something of the science. But it is also clear, at any rate, that in this case too activity is prior in this way to potentiality too, namely, in coming to be and time.

But then it is also prior even in substance, first, because the things that are posterior in coming to be are prior in form and in substance—for example, man to boy and human to seed; for the one already has the form, while the other does not—and because everything that comes to be proceeds toward a starting-point and an end (for the for-the-sake-of-which is a starting-point, and the coming to be is for the sake of the end), and the activity is the end, and it is for the sake of this that the capacity [or potentiality] is acquired. For animals do not see in order that they may have sight; rather, they have sight in order that they may see, and similarly too people have the craft of building in order that they may build and the capacity to contemplate in order that they may contemplate. But they do not contemplate in order that they may have the capacity to contemplate, except those who are practicing, and they do not contemplate except in this way, or because there is nothing they need to contemplate.[395]

Further, the matter is potentially something because it may come in the form of it—at any rate, when it is actively something, it *is* in the form of it. It is the same way in the other cases, even those in which the end is a movement. That is why, just as teachers think that they have delivered the end result when they have demonstrated [their student] in activity, nature also does likewise. For if it does not happen in this way, it will be like Pauson's Hermes; for it will even be unclear whether the scientific knowledge is inside or outside,[396] just as with that figure. For the work is the end,

393. 7.7–8.

394. *NE* 1105ᵃ17–25.

395. Reading ἢ ὅτι οὐδὲν δέονται θεωρεῖν. Those who are practicing not in order to acquire the capacity but in order to retain it have the capacity to contemplate but may not activate it (on a given occasion) because they have no need to do so (then).

396. Unless we see a student activate his scientific knowledge in appropriate circumstances, it will be unclear whether he has it autonomously or is merely repeating what he has heard from his teacher.

and the activity is the work, and that is why the name "activity" is said of things with reference to the work, and extends to the actuality.

And, while in some cases it is the use that is the ultimate thing (for example, seeing in the case of sight, and nothing else beyond this comes to be from the work of sight), from other things something [else] does come to be (for example, from the craft of building a house comes to be that is beyond the activity of building), yet the use is in the former case no less the end, and in the latter case more the end, than the capacity is; for the activity of building is in what is being built and comes to be and is at the same time as the house. In the cases, then, where what comes to be is some other thing beyond the use, in those cases the activity is in what is being produced—for example, the activity of building is in what is being built, the activity of weaving is in what is being woven, and similarly in the other cases, and in general, the movement is in what is being moved. But in all the cases where there is not some other work beyond the activity, the activity is in the relevant things—for example, the seeing is in the one who sees, the contemplating in the one who contemplates, and the living in the soul (which is why happiness is also in it; for it is a certain sort of living[397]). So it is evident that the substance and the form are activity.

In accord with this argument, then, it is evident that activity is prior in substance to potentiality, and, as we have said,[398] one activity always precedes another in time until one reaches the activity of what primarily and eternally causes movement.[399]

But then activity is also prior in a stricter sense; for eternal things are prior in substance to things that pass away, and nothing eternal exists potentially. The reason is this. Every capacity [or potentiality] is at the same time for something and for the contradictory; for while what is incapable of belonging cannot belong to anything, everything that is capable admits of not being active. So what is capable of being admits both of being and of not being. Therefore, the same thing is capable both of being and of not being. But what is capable of not being admits of not being. And what admits of not being can pass away, either unconditionally or in that way in which it is said to admit of not being, with respect to place, or to quantity, or to quality; and unconditionally is with respect to substance. Therefore, none of the things that cannot unconditionally pass away are unconditionally potential (although nothing prevents one from being so in a certain respect—for example, with respect to quality or place). So all of them are actively [what they are]. Nor are any of the necessary beings potential ones (and yet these are primary things; for if they were not, nothing would be). Nor, then, is movement potential, if some movement is eternal. Nor, if there is something that is eternally moved is it moved in accord with a capacity [or potentiality], except from somewhere to somewhere (but nothing prevents matter for this sort of movement from belonging to it).

That is why the sun, the stars, and the whole heaven are always active, and there is no fear that they may sometime stand still, which is what those concerned with

397. *NE* 1098a12–18.
398. 1049b24–29.
399. 12.7.

nature fear,[400] nor do they get tired doing this; for movement is not for them connected with a capacity for the contradictory, as it is for things that can pass away, so that the continuity of the movement is laborious; for the substance that is matter and potentiality, and not activity, is what causes this.

The things that cannot pass away are also imitated by things that are involved in change—for example, earth and fire. For these too are always active; for they have their movement both intrinsically and within themselves. But the other capacities, from what has been determined about them, are all for something and for the contradictory (for what is capable of moving something in this way is also capable of moving it not in that way), at any rate, in all cases that are in accord with reason. And the same non-rational capacities will, by their presence or non-presence, be for something and for its contradictory.

Therefore, if there are some natures or substances of the sort that the people involved in accounts say the Forms are, there will be something that is much more of a science than science-itself, and much more of a movement than movement[-itself]; for the former are more activities and the latter capacities for them. **1051^{a}1**

That activity is prior both to potentiality and to every starting-point of movement, then, is evident.

9.9[401]
Activity More Estimable Than Potentiality; Activity and Potentiality in Knowledge

It is clear from the following considerations, however, that the activity is also better and more estimable than the excellent capacity. For in the case of those things that are said to *be* with reference to being capable, the same one is capable of contraries—

400. *Cael.* 284^{a}11–26.

401. (1) In 1.2, Aristotle argues in a preliminary way that theoretical wisdom must, as the most estimable science, deal with the most estimable beings, and so be a sort of theology (982^{b}24–983^{a}11). In 6.1, he argues that theology, though dealing with a single kind, could nonetheless be the right sort of universal science to be theoretical wisdom (1026^{a}23–32). (2) In 7.1, he argues that the focus of this science must be substance, since it is primary in account, in knowledge, and in time (1028^{a}31–^{b}7). Form then emerges as apparently the best candidate to be substance (1029^{a}26–33), but matter (or material substance) remains on the scene (1035^{a}2, 1042^{a}32). Then form gets identified with activity or actuality, matter with potentiality (1043^{a}4–26). (3) In 9.8, activation or actuality is argued to be prior to matter (or material substance) in account, in time, and in substance, and to be the end for the sake of which a capacity is acquired or possessed (1050^{a}8–10). (4) 9.9 becomes easier to understand if we see the first part (1051^{a}4–21) in relation to (1), arguing that activity or actuality (form) is more estimable than potentiality (matter), and so is a better candidate to be the focus of the science of being qua being, and the second part (1051^{a}21–33) in relation to (2), arguing that actuality is also prior in knowledge to potentiality, and so is in that respect too a better candidate to be primary substance. It then emerges as completing the project of (3) in an intelligible way.

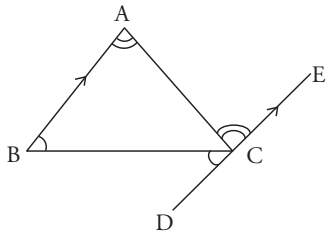
for example, the same thing that is said to be capable of being healthy is also capable of being sick, and at the same time; for the same capacity is the capacity to be healthy and to be sick, to be resting and to be moving, to build and to demolish, and to be built and to collapse. The capacity for contraries, then, is present at the same time.

For the contraries to be present at the same time, however, is impossible, and for the activities to be present at the same time is impossible (for example, being healthy and being sick), so that it is necessary for the good to be one or the other of them. But being capable is of both alike, or of neither. Therefore, the activity is better. And it is necessary in the case of the bad things too for the end and the activity to be worse than the capacity; for the same thing is capable of both contraries. It is clear, therefore, that the bad does not exist beyond the things; for the bad is posterior in nature to the capacity.[402] Therefore, neither in the things that there are from the start nor in the eternal things is there anything bad, in error, or destroyed (for destruction is also something bad).

And geometrical diagrams are discovered actively; for people discover them by actively dividing. If they had already been divided, they would be evident; but as it was they were present potentially. Why are the interior angles of a triangle equal to two right angles? Because the angles around one point are equal to two right angles. If, then, the line had already been drawn upward parallel to the side, why this is so would be immediately clear on seeing it.[403] Why is the angle in a semicircle universally a right angle? Because if three lines are equal, the two that form the base and

402. The bad, as the activation of a bad capacity, cannot exist without that capacity, but the bad capacity can exist without being activated.

403. The triangle whose interior angles we must prove equal to two right angles is ABC:



The division actively made is to draw DC upward through C parallel to AB. Angle ABC = BCD (alternate angles). Angle BAC = ACE (alternate angles). Therefore, the angles BCD + ACB + ACE = ABC + ACB + BAC. But the angles BCD + ACB + ACE = the angles around the point C = two right angles. Therefore, ABC + ACB + BAC = the interior angles of the triangle ABC = two right angles. It is not implausible to claim that as soon as DE is actually drawn, we can see immediately that this is so.

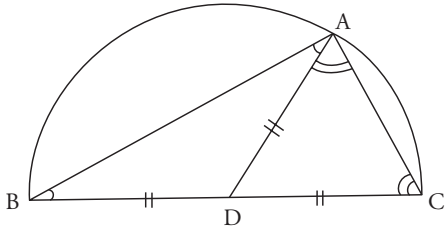
the one dropped straight from the center, it is clear on seeing it to the person who knows that.[404]

So it is evident that the things that are potential are discovered when they are actively drawn. And the cause of this is that understanding is the activity, so that what is potential [is discovered] from the activity, and because of this they know by [actively] producing (for the single activity is posterior in coming to be).

9.10[405]
True and False Being; the Case of Incomposites; Understanding and Error

Since something is said to *be* or *not to be*, in some cases with reference to the figures of predication, in others with reference to the potentiality or activity of these or to their contraries, and in others by being in the strictest sense true or false, and since **$1051^{b}1$**

404. The division actively made is to draw (or drop) DA from the center D to the circumference.



BD = AD = CD (radii of the same semicircle). Therefore, BAD and CAD are isosceles triangles. Therefore, the angle BAD = ABD and the angle CAD = ACD (base angles of isosceles triangles are equal). Therefore, the angle BAC (which = BAD + CAD) = ABD + ACD. But ABC + ACB + ACE = two right angles (previous result). Therefore, the angle BAD must be a right angle.

405. (1) 6.4 excludes from the purview of theoretical wisdom the sort of being that is being true or being false, considered as affections of beliefs or propositions. At the same time, it adverts to a kind of truth and falsity that is in things rather than in beliefs or propositions ($1027^{b}25–26$). In the case of "simple things and the what-it-ises," it tells us that truth and falsity are "not even in thought," and so not in things either ($1027^{b}27–28$). (2) 7.17 renews the search for substance as the key to being qua being, by focusing on the fact that "the substance is a starting-point and cause" ($1041^{a}9–10$). As such, it must be the answer to the question "Why does one thing belong to a certain other?" ($1041^{a}10–11$), so that "what is being looked for is the cause in virtue of which the matter is something. But this is the substance" ($1041^{b}7–9$). Exempted from such inquiry and teaching, however, are "things [said] simply" ($1041^{b}9–11$), where "one thing is not said of another" ($1041^{a}34–^{b}2$).

this, in the case of the things, is being combined or being divided,[406] so that a person grasps what is true when he thinks what is divided to be divided or what is combined to be combined, while he grasps what is false when his state is contrary to that of the things—when is there and when is there not what we call "true"[407] or "false"? For what we mean by this must be investigated. For it is not because we truly think you to be pale that you are pale, but it is because of your being pale that we who say this grasp what is true.

So if some things are always combined and it is impossible for them to be divided, and others are always divided and it is impossible for them to be combined, while others admit of both contraries, then, while to be is to be combined and one, not to be is not to be combined and many. As regards the things that admit of both contraries, then, the same belief or the same account comes to be false and true, and admits at one time of grasping what is true and another time of grasping what is false, but as regards the things that cannot be otherwise, it does not come to be at one time true and at another time false; rather, the same ones are always true or always false.

As regards the incomposite things, then, what is being or not being and what is truth and falsehood? For they are not composite, so that they would be if combined and not be if divided, like the pale and the log or the incommensurable and the diagonal, nor will truth and falsehood still hold in the same way in their case. Or, rather, just as truth is not the same in their case, neither is being. Instead, truth or falsity consists in this—to touch and to phrase are true (for an affirmation and a phrase are not the same),[408] but to be ignorant is not to touch. For it is not possible to be mistaken about the what-it-is, except coincidentally; and the same holds with regard to incomposite substances, for it is not possible to be in error about them; and they are all active, not potential, for otherwise they would have come to be and passed away. But as things stand being does not itself come to be or pass away; for if it did, it would have to come to be from something.

Thus, with regard to those things that are precisely what something is and activities,[409] it is not possible to be in error, but either to understand or not understand, but where they are concerned, their what-it-is is inquired about, whether they are such-and-such or not. With being as truth and not being as falsehood, by contrast, one sort, if it is in fact combined, is true, while if it is not combined, it is false, the other sort is if indeed it is a being in this way, while if it is not [a being] in this way, it is not. But truth is understanding these things, while falsehood does not exist and neither does any error, but ignorance does exist, though it is not like blindness; for blindness would be like wholly lacking the part that understands.[410]

410. *DA* 430ᵇ26–30.

It is evident too that about the immovable things there can be no mistake as regards time, if one supposes them to be immovable. For example, if one thinks that the triangle does not change, one will not think that at one time it has interior angles equal to two right angles and that at another time it does not (for in that case it would change), but that one sort is and another sort is not—for example, that no even numbers are prime, or that some are and some are not. But about a single thing that is one in number not even this [sort of mistake can occur]; for one will no longer think that one thing is and another is not, but will grasp what is true or grasp what is false as always being that way.

BOOK 10 (IOTA)

10.1
The Ways in Which Beings Are Said to Be Intrinsically One; the Being for a One

It was stated previously,[411] in our discussions concerning in how many ways things are said, that things are said to be one in many ways. But though they are said to be so in many ways, there are four ways of bringing together under headings the things that are primary and said to be one[412] intrinsically, not coincidentally.

There is the continuous, either unconditionally or most so by nature, and not by contact or by being tied together (and of these, what is more one and prior is what has a more indivisible and simpler movement).

Further, even more like this is what is a whole and what has a certain shape and form, and most so if it is like this by nature and not by force, as things are that are glued or nailed or tied together, but has within itself the cause of its own continuity. And it is like this because its movement is one and indivisible in place and in time, so that it is evident that if something has by nature the primary starting-point of the primary movement (I mean circular spatial movement),[413] it is the primary thing that is one in magnitude.

Some things, then, are one in this way, by being continuous or whole, while the other things that are one are those whose account is one. And things of this sort are things of which the understanding is one,[414] and things of this sort are things of which the understanding is indivisible, and it is indivisible when the thing is indivisible in form or in number. In number, then, the particular is indivisible, while in form

411. 5.6.
412. Reading πρώτων.
413. *Ph.* 265[a]16–17.
414. *DA* 430[b]14–15.

it is what is so in knowability and in scientific knowledge, so that the primary thing that is one would be the cause of substances' being one.

Things, then, are said to be one in this many ways: the continuous by nature and the whole, the particular, and the universal. And all these are one because of the indivisibility in some cases of their movement and in others of their understanding or their account.

1052b1 One should understand that the following must not be taken to be equivalent: what sorts of things are said to be one? and what is the being for a one? That is, what is the account of it? For things are said to be one in this many ways, and each thing will be one when one of these ways of being one belongs to it. But the being for a one will sometimes be the being for one of these things and sometimes for something else that is even closer to the name, while the former things are closer to its capacity.[415] It is just as is the case with element or cause, if one had to speak about them both by distinguishing the things to which they apply and by giving the definition of the names. For in one way fire is an element (or perhaps what is intrinsically so is the unlimited or something else of this sort), while in another way it is not; for the being for fire and the being for an element are not the same; but rather, while as a thing and a nature fire is an element, what the name "element" signifies is that this belongs to it, that something is from it as a primary component. And it is likewise too in the case of cause and one and all such things.

That is also why the being for one is the being for what is indivisible, namely, being precisely a this and on its own, inseparable[416] either in place or in form or in thought, or again with respect to what it is to be a determinate whole,[417] but most of all by being the first measure of each kind, and, in the strictest sense, of that of quantity; for it is from this that it has been extended to the others; for a measure is that by which a quantity is known, and a quantity insofar as it is a quantity is known either by a one[418] or by a number, and all number by a one, so that all quantity insofar as it is quantity is known by the one, and what quantities are primarily known by, this very thing is one. That is why the one is the starting-point of number insofar as it is number. And, by extension from this, so too in the others what is said to be a measure is the primary thing by which each is known, and the measure of each thing is a one, in length, in breadth, in depth, in weight, or in speed (for weight and speed are common to both contraries; for each is twofold—for example, weight is both what has any tendency of whatever degree to move down and what has an excessive tendency to move down, and speed is what has any amount of movement whatever and what has an excess of movement; for there is some speed even of the slow, and weight of the lighter).

In all these, then, the measure and starting-point is something that is one and indivisible, since even in lines we use the one-foot line as indivisible. For everywhere

415. I.e., that of the name to apply to various things.
416. Reading ἀχωρίστῳ (1016b2).
417. Reading τῷ ὅλῳ καὶ διωρισμένῳ.
418. I.e., a unit.

people seek as a measure something that is one and indivisible; and this is the simple in either quality or quantity. Where it seems impossible to take away or add, then, this measure is exact, which is why that of number is most exact; for people posit the unit as in every way indivisible. And in the other cases they imitate this sort of measure; for in the case of a stade, a talent, or anything comparably large, some addition or subtraction might more readily escape notice than in the case of something smaller. So the primary thing from which, as far as perception goes, that cannot happen, this is what everyone makes a measure, whether of liquids or of solids, weight or magnitude, and they think they know the quantity when they know it by means of this measure.

And what is more, people think they know movement too by the movement that is simple and fastest (for this takes the least time). That is why in astronomy a one of this sort is a starting-point and measure (for they posit the movement of the heaven to be uniform and fastest, and judge the others relative to it), and in music, it is the quarter-tone (because it is the smallest interval), and in speech the phonetic element. And all these are one something in this way—not that a common something is the one in all, but in the way stated. The measure is not always one in number; sometimes there are several—for example, the quarter-tones are two (not to hearing but in the ratios involved), and the voiced sounds by which we measure are several, and the diagonal is measured by two measures,[419] and so are all magnitudes.

In this way, then, the measure of all things is the one, in that we come to know the things from which substance is [constituted] when we divide either with respect to quantity or with respect to the form. And it is because of this that the one is indivisible, because the primary measure of each of these is indivisible. But not every measure is indivisible in the same way—for example, a foot and a unit. Instead, a unit is so in every way, while a foot is meant to be[420] among the things that are perceptually indivisible, as has already been said;[421] for presumably everything continuous is divisible.

(The measure is always in the same kind as what is measured; for that of spatial magnitudes is a spatial magnitude, and, in particular, of length a length, of breadth a breadth, of voiced sound a voiced sound, of weight a weight, and of units a unit. For this is the way the latter case must be supposed to be, and not the way that the measure of numbers is a number. And yet that would be necessary, if it were supposed to be a similar way to the others. But it is not really a similar claim. On the contrary, it would be like claiming that the measure of units is units, and not a unit; but a number is a plurality of units.)

Also, we say that scientific knowledge is a measure of things, as is perception, because of the same thing, that we come to know something by them, since really

419. Secluding καὶ ἡ πλευρά ("and so is the side").
420. Reading ἐθέλει εἶναι.
421. $1052^{b}33$, $1053^{a}5$.

they are measured more than they measure. It is as if someone else measured us and we came to know how big we are by seeing that he applied the cubit-measure to such-and-such a fraction of us. But Protagoras says[422] that "man is the measure of all things," as if he had said "the man who has scientific knowledge" or "the man who perceives," and that these are the measure because they have, in the one case, perception and, in the other, scientific knowledge, which we say are measures of the underlying objects. People who say what Protagoras says, then, are saying nothing, though they appear to be saying an extraordinary thing.

It is evident, then, that the being for a one, when defined with regard to the meaning of the name, is most of all a certain measure, and in the strictest sense of quantity, and after that of quality. And one thing will be of this sort if it is indivisible with respect to quantity, and another if it is so with respect to quality, which is why the one is indivisible, either unconditionally or insofar as it is one.

10.2
The Substance and Nature of the One

With regard to the substance and the nature of the one, however, it must be investigated in which of two ways it stands, just as in going through the puzzles[423] we went through what one is and how we should get a grasp on it, whether we must grasp the one itself as being a certain substance (as the Pythagoreans say earlier and Plato later), or whether instead a certain nature underlies it, and one should say what one is in some more familiar way and more in the manner of those concerned with nature; for of those, one says that the one is love, another air, and another the unlimited.[424]

If, then, none of the universals can be substance, as was said in the accounts concerned with substance and with being,[425] and because being cannot itself be substance in the sense of some one thing beyond the many (for it is common [to all of them]), but instead is only something predicated, clearly one cannot be substance either; for being and one are the most universally predicated things of all. So the kinds are neither certain natures and substances separable from the other things nor—due to the same causes as in the case of being and substance—can one be a kind.

Further, the same must hold in all cases. Things, though, are said in the same number of ways to be one and to be. So if indeed among qualities the one is a certain thing and a certain nature, and similarly too among quantities, it is clear that it must be investigated, in general, what one is, just as with what being is, on the grounds that it is not enough to say that its nature is just this[: to be one]. But then among colors, the one is a color, white, and so the other colors are seen to come to be from this and

422. 1009a6–16.
423. 1001a4–1001b25 (= P11).
424. Empedocles, Anaximenes, Anaximander.
425. 7.13.

black, and black is the privation of white, just as dark is of light. So if the beings were colors, the beings would be a certain number, but of what? Clearly, of colors. And the one would be a certain one, white. Similarly, if the beings were melodies, they would be a number, this time of quarter-tones. But the substance of them would not be number, and the one would be something whose substance was not the one but the quarter-tone. And similarly in the case of sounds, the beings would be a number of phonetic elements, and the one would be a thing voiced. And if they were rectilinear figures, they would be a number of figures, and the one would be the triangle. And the same account applies to the other kinds. So if indeed in affections, in qualities, in quantities, and in movement there are numbers and a certain one, in all of them the number is a number of certain things and the one is one something, but this is not its[426] substance. And the same must hold in the case of substances; for the same holds in all cases.

It is evident, then, that the one is a certain nature in every kind and that in no case is its nature just this very same thing; rather, just as in colors the one itself that must be investigated is one color, so too in substance the one itself that must be investigated is one substance. And that one in a way signifies the same as being is clear from the fact that it follows along with the categories in the same number of ways and by its not being in any category (for example, not in the what-it-is and not in quality either, but having the same relation to them as being does); from the fact that no other thing is additionally predicated in one human than in human (just as being is not something beyond the what or quality or quantity); and from the fact that being for one is just the being for the given thing.

10.3
Same, Similar, Distinct, Different, Contrary

The one and the many are opposed in several ways, of which one is that of the one and the plurality as indivisible and divisible; for what is either divided or divisible is said to be a sort of plurality, while what is indivisible or not divided is said to be one. Since, then, oppositions are of four sorts, and one of the opposites is said of things as a privation, they must be contraries,[427] and be said neither as contradictory nor as relatives. And the one is said to be [what it is] and is made clear from the contrary, the indivisible from the divisible, because what is a plurality and divisible is more perceptible than what is indivisible, so that in account the plurality is prior to the indivisible because of perception. And with the one belong—as we diagrammed in our division of the contraries[428]—the same and the similar and the equal, and with plurality, the other, the dissimilar, and the unequal.

426. Reading αὐτοῦ.
427. Reading ἐναντία ἂν εἴη καὶ.
428. 1004^{a}2.

Things are said to be the same in many ways. One is that we sometimes say the same with respect to number.[429] Another is if they are one both in account and in number—for example, you are said to be one with yourself both in form and in matter. Further, if the account of their primary substance is one—for example, equal straight lines are the same, as are equal and equiangular quadrilaterals, and yet they are many; but in these equality constitutes oneness.

Things are similar[430] if, while not being unconditionally the same, nor without difference with respect to their composite substance, they are the same with respect to their form, as the larger square is similar to the smaller. And unequal straight lines are similar—similar, yes, but not unconditionally the same. Other things are similar if, having the same form, and being things in which the more and less occurs, they are neither more nor less than each other. Other things, if they have affections that are in form one and the same (for example, the white) to a greater or lesser degree, are said to be similar because the form of these is one. Other things if they have more of the same than of different affections, either unconditionally or the more obvious ones—for example, tin is like silver in that it is white, or fire like gold in that it is yellow and flame-colored.

So it is clear that things are also said to be distinct [or other] and dissimilar in many ways. That is, on the one hand, they are said to be distinct or the same in opposite ways, which is why everything is related to everything either by being the same or by being distinct, but, on the other, they are said to be distinct unless both their matter and their account are one (which is why you and your neighbor are distinct). And the third way things are said to be distinct is the way the objects of mathematics are. Because of this, then, everything can be said to be distinct or the same in relation to everything, that is, of those said to be one and to *be*; for distinct is not the contradictory of same, which is why it is not said of the non-beings (while not-the-same is said), but all the beings are said to be distinct; for everything that is and is one is by its nature either one or not one [with such a thing].

The distinct, then, and the same are opposed in this way. But difference is not the same as distinctness. For the distinct and what it is distinct from are not necessarily distinct in some respect (for whatever is a being is either distinct or the same), but the different is different from something in some respect, so that it is necessary for there to be something that is the same whereby they differ. And this thing that is the same is kind or form; for all things that differ, differ either in kind or in form—in kind if the things do not have their matter in common and if there is no coming to be from one to the other (for example, things whose figure of predication is not the same), and in form if they have the same kind (and what is said to be a kind is that same thing which both of the different things are said to *be* with respect to their substance).

429. As when A and B are coincidentally one (1015b17–36).
430. 1018a15–18.

Contraries are different and contrariety is a sort of difference. It is clear from induction that this hypothesis is correct; for all these contraries too are manifestly different and not merely distinct; rather, some are distinct in kind, while others are in the same column of predication, and so they are in the same kind and are the same in kind. It has been determined elsewhere[431] what sorts of things are the same or distinct in kind. **1055^{a}1**

10.4
Contrariety

Since things that differ can differ from each other more or less, there is also a sort of greatest difference, and this I call "contrariety." That it is the greatest difference is clear from induction. For things that differ in kind do not have a route to each other, but are too far distant, and not comparable. And for those that differ in form, the comings to be are from the contraries as extremes, and the distance between the extremes is greatest, so that it is also greatest between the contraries.

But surely the greatest in each kind is complete. For the greatest is what cannot be exceeded, and a complete thing is that outside of which no part can be found; for the complete difference has an end (just as other things are said to be complete due to having an end), and outside the end there is nothing; for in everything the end is the extreme and encompasses everything else, which is why there is nothing outside it, and why the complete needs nothing further.

From these considerations, then, it is clear that contrariety is complete difference. But as things are said to be contraries in many ways, the completely contrary will follow along with the ways that being contrary belongs to them.

These things being so, it is evident that one thing cannot have more than one contrary (for there cannot be anything more extreme than the extreme and there cannot be more than two extremes of the same extension), and in general, if contrariety is a difference, and a difference is between two things, so too must the complete difference be.

But the other definitions of contraries must also be true. For in fact the complete difference is the greatest difference (for outside the things that differ in kind or in form no further difference can be found; for it has been proved that in relation to things outside the kind there is no difference, while in those in the kind the complete difference is the greatest). Also, the things in the same kind that differ the most are contraries (for the complete difference is the greatest difference between these). Also, the things in the same receptive subject that differ the most are contraries (for the matter for contraries is the same). And the things that fall under the same capacity

431. 1016^{a}24–32, ^{b}33–34, 1024^{b}9–16.

that differ the most are contraries (for the science that is one science is also concerned with one kind), and in these the complete difference is the greatest.

The primary contrariety, however, is that between having and privation—not every sort of privation, though (for something is said to be a privation in many ways), but the sort that is complete. And the others will be said to be contraries with reference to these, some because they have these, others because they produce or are productive of them, others because they are acquisitions or losses of these or of other contraries.

If, then, the sorts of opposition are contradiction, privation, contrariety, and relatives, and of these the primary sort is contradiction, and of a contradiction there is no intermediate, while contraries do admit of one, it is clear that contradiction and contraries are not the same. But a privation is a sort of contradiction. For both what is entirely incapable of having something and what is naturally such as to have it but yet does not have it, is deprived of it, either generally or in some definite way (for here we are already saying that this is said in many ways, which we have distinguished elsewhere[432]), so that a privation is a sort of contradiction or incapacity, which is either definite or taken in combination with the receptive subject, which is why there is no intermediate of a contradiction, while for a sort of privation there is one; for while everything is either equal or not equal, not everything is either equal or unequal, or if indeed it is, it is only in what is receptive of the equal.

If, then, the comings to be in the matter are from contraries, and proceed either from the form and the having of the form or from a sort of privation of the form and the shape, it is clear that every contrariety would be a privation, but presumably not every privation is a contrariety (the cause of this is that there are many different ways in which what is deprived of something admits of being deprived of it); for it is the extremes from which the changes proceed that are contraries. And this is also evident through induction. For every contrariety has a privation as one of its contraries, but not all cases are alike; for, on the one hand, inequality is the contrary of equality, and unlikeness of likeness, but, on the other, vice is the contrary of virtue, and these cases differ in the way that has been stated;[433] for it is one case if the thing suffers a privation, but it is another if it does so at a certain time or in a certain way—for example, at a certain age or in the controlling part—or throughout. That is why in some cases there is something intermediate, and a human can be neither good nor bad, and in others there is not; rather, a number is necessarily either odd or even. Further, some contraries have a definite underlying subject, while others do not. So it is evident that one of the contraries is said of things as a privation. But it is enough if this is true of the primary ones, that is, the generic contraries (for example, the one and the many); for the others lead back to these.

432. 5.22.
433. 1055b4–6.

10.5
Puzzles about How the Equal Is Opposed to the Great and the Small

But since one thing is contrary to one thing, one might raise a puzzle about how the one is opposed to the many, and the equal to the great and the small.

For we say[434] "whether it is so-and-so" only in an antithesis, such as "whether it is white or black" or "whether it is white or not white" (but we do not ask whether it is human or white, unless we are proceeding on a hypothesis and inquiring about whether it was Cleon who came or Socrates). But this is not a necessary antithesis in any kind. Yet even it derives from the case of opposites; for only opposites cannot be present at the same time, and one makes use of this fact here too in asking whether it was the one or the other who came; for if it were possible for both to have come at the same time, the question would be ridiculous. But if it is possible for both to have come at the same time, even so the question falls just as much into an antithesis, **1056^{a}1** that of the one or the many, that is, one asks whether both came or one of the two. If, then, the question "whether so-and-so?" is always concerned with opposites, and it is asked whether something is greater or less or equal, what is the opposition of the equal to these? For it is not contrary to either alone or to both; for why should it be contrary to the greater rather than to the lesser?

Further, the equal is contrary to the unequal, so it will be contrary to more than one thing. But if the unequal signifies the same as both the greater and the lesser together, the equal will be opposite to both (and the puzzle supports those[435] who say that the unequal is a dyad), and it follows that one thing is contrary to two, which is precisely what is impossible.

Further, the equal is manifestly intermediate between great and small, but no contrariety is manifestly intermediate or, from its definition, can possibly be so (for it would not be complete if it were intermediate between something), rather, it always has something that is intermediate within itself.

It remains, then, that the equal is opposed to the great and the small either as negation or as privation. But it certainly cannot be the negation or privation of one of the two (for why of the great rather than of the small?); therefore, it is the privative negation of both—which is also why "whether" is asked of a thing with reference to both and not just to one of the two (for example, whether it is greater or equal, or whether it is equal or less), but instead there are always three terms. But it is not a necessary privation; for not everything that is either not greater or not less is equal, but only the things in which these are naturally found.

The equal, then, is the neither large nor small but is naturally fitted to be large or small, and is opposed to both as a privative negation, which is why it is intermediate between them.

434. Reading τὸ γὰρ.
435. Platonists ($1087^{b}7$).

Also, the neither good nor bad is opposed to both, but is nameless; for things are said to be each of these in many ways[436] and their receptive subject is not one—rather, the neither black nor white would be more so. But this is not said to be one either, although the things of which this is said as a privation are in a way definite; for they must be either gray or ochre or something else like that.

So those people[437] are incorrectly evaluating the matter who think that all such phrases are said of things in the same way, so that between shoe and hand there will be an intermediate, the neither a shoe nor a hand, seeing that the neither good nor bad is intermediate between the good and the bad, as if there will be something intermediate in all cases. But this does not necessarily follow. For in one case there is a joint negation of opposites between which there is a certain intermediate and a certain natural extension, while between the other two there is not a difference; for the things jointly denied are in different kinds, so that the underlying subject is not one.

10.6
Puzzles about How the One Is Opposed to the Many

One might also raise similar puzzles about the one and the many; for if the many are unconditionally opposed to the one, some impossible things follow. For the one will
1056b5 then be few (singular) or few (plural);[438] for the many are opposed also to the few. Further, the two will be many, if indeed the double is a multiple, and is said of things with reference to the two. So the one will be few; for in relation to what are the two many, if not in relation to the one and the few? For there is nothing smaller.

Further, if as the long and short are in length, so too in plurality are the much and the few, and if whatever is much is also many, and the many much (unless indeed there is a difference in the case of something continuous and easily bounded), the few will be a plurality. So the one is a sort of plurality, if indeed it is few too. But it must be this, if the two are many. But perhaps, though the many are in a way said to be also much, it is with a difference—for example, water is much but not many.

Things that are divisible, however, are said to be many—in one way if there is a plurality that has an excess, either unconditionally or in relation to something (and few in the same way is a plurality that has a deficiency), and in another way, in number, and it is only in this way that the many is opposed to the one. For it is in this way that we say that something is one or many, just as if one said one and ones, or white thing and white things, or the things measured and what is measurable relative to the measure—and multiples are said to be one or many in the same way; for each number is said to be many because of ones, and because each is measurable

436. *NE* 1096a23–29.
437. Identity unclear.
438. *Oligon* (singular), which also means "little," *oliga* (plural).

by the one, and in a way that is opposed to the one, not to the few. In this way, then, even the two are many, but as a plurality that has an excess, either in relation to something or unconditionally, they are not—rather, they are the first plurality. Unconditionally, the two are few; for they are the first plurality with a deficiency.[439] That is why Anaxagoras incorrectly abandoned his task when he said that "all things were together, unlimited both in plurality and in smallness."[440] Instead of "and in smallness" he should have said "and in fewness"; for they could not have been unlimited in fewness, since the few is not [what it is] because of the one, as some say, but because of the two.

The one is opposed to the many[441] in the case of numbers, then, as measure is to measurable. But these are opposed as those relatives are that are not intrinsically relatives. We have determined elsewhere that things are said to be relatives in two ways,[442] some as contraries, others in the way that scientific knowledge is related to the scientifically knowable, where something is said to be relative because something else is relative to it. Nothing, however, prevents the one from being less than something—for example, than the two; for it is not the case that if it is less, it is also few.

Plurality is like a kind of number; for number is plurality that is measurable by one, and so the one and number are in a way opposed—not as contrary, but in the way it was said that certain relatives are; for insofar as one is measure and the other measurable, in that way they are opposed, which is why not everything that is one is a number—for example, if something is indivisible it is not a number. And though scientific knowledge is said to be in the same way relative to the scientifically knowable, the way does not turn out to be the same. For while scientific knowledge may seem to be the measure and the scientifically knowable what is measured, the fact is that all scientific knowledge is scientifically knowable but not all that is scientifically knowable is scientific knowledge, because in a way it is scientific knowledge that is measured by the scientifically knowable.[443]

Plurality is contrary neither to the few (instead, the much is contrary to it, as plurality that exceeds is to plurality that is exceeded) nor in all ways to the one. One way, however, in which they are contrary, as was said, is because a plurality is divisible, while the one is indivisible, but in another way they are relative, just as scientific knowledge is to the scientifically knowable, if a plurality is a number and the one a measure.

439. P_1 has a deficiency (unconditionally) if and only if there is no plurality P_x such that P_x is a smaller many (has fewer members) than P_1.

441. Reading τοῖς πολλοῖς.
442. 5.15.
443. *Cat.* 7^{b}22–33.

10.7
Contraries and Intermediates

Since contraries admit of an intermediate and in some cases there is one, intermediates must be composed of the contraries. For all intermediates are in the same kind as what they are intermediates of. For we say that those things are intermediates into which what changes must change earlier—for example, if one proceeds from the highest string to the lowest by the smallest intervals, one will come earlier to the intermediate notes, and, in colors, if one proceeds from white to black, one will come earlier to purple or gray than to black, and similarly in the other cases. But to change from one kind to another kind is not possible except coincidentally, as from a color to a shape.[444] Therefore, it is necessary for the intermediates to be in the same kind both as each other and as what they are intermediates of.

But surely all intermediates are between opposites of some sort; for they can intrinsically change from these alone (which is why it is impossible to be intermediate between non-opposites; for otherwise there would be change that was not from opposites). But of opposites, contradictories admit of no intermediate (for this is what a contradiction is, an antithesis one or the other side of which must be present in anything whatever, not having any intermediate), and of the other opposites, some are relative, others a privation, others contrary. Among relatives, those that are not contraries do not have intermediates. The cause of this is that they are not in the same kind. For what could be intermediate between scientific knowledge and scientifically knowable? But between large and small, there is one.

If intermediates are in the same kind, as has been proved, and are intermediates of contraries, they must be composed of these contraries. For either there will be a kind of them or there will be none. And if there is to be a kind in such a way as to be something prior to the contraries, the differences that made the contrary forms as forms of a kind will be contraries that are prior to these; for the forms are composed of the kind and the differences (for example, if white and black are contraries, and one is a dilating color and the other a contracting color,[445] these differences—dilating and contracting—are prior, so that these are contraries of each other that are prior). But then the forms that are differentiated in contrary ways, at any rate, will be contraries to a higher degree. And the other forms, the intermediates, will be composed of their kind and their differences (for example, all colors that are intermediate between white and black must be said to be composed of the kind—and the kind is color—and of certain differences; but these differences will not be the primary contraries; otherwise every color will be either white or black; therefore, they must be distinct ones; therefore, they will be intermediate between the primary contraries, and the primary [contrary] differences are dilating and contracting).

444. As when a red thing becomes round.
445. The reference is to Plato's theory (*Timaeus* 67d–e).

So it is with regard to these contraries that are not within a kind that one must first inquire about what their intermediates are composed of (for things that are in the same kind must be composed of things of which the kind is not a component, or else must be incomposite). Contraries are not composed of each other, then, so they are starting-points, while the intermediates are either all incomposite, or none are. But from the contraries something comes to be, and so there will be change into it before there is one into them; for there will be less of the one in it and more of the other. Therefore, it too will be intermediate between the contraries. And therefore all the other contraries will be composites; for what is more-of-this and less-of-that is a composite in some way of those things that it is said to be in the one case more of and in the other less of. And since there are no other things of the same kind that are prior to the contraries, all the intermediates must be composed of the contraries, so that all the things downstream too, both the contraries and the intermediates, will be composed of the primary contraries.

It is clear, then, that the intermediates are all in the same kind, intermediate between contraries, and all composed of the contraries.

10.8
Distinctness in Form

What is distinct in form is distinct from something, in something, and this latter thing must belong to both—for example, if one animal is distinct in form [from another], both are animals. Therefore, [two] things that are distinct in form must be in the same kind; for this is the sort of thing I call a "kind," that by reference to which both things are said to be one and the same, and that is not coincidentally differentiated, whether as matter or otherwise. For not only must the common thing belong to them (for example, that both be animals) but also this thing, the animal itself, must be distinct in each of the two (for example, in the one case, horse, in the other, human), which is why this, the common thing, must be reciprocally distinct in form. Intrinsically, then, they will be, in the one case, such-and-such sort of animal, in the other, so-and-so sort—for example, in the one case, horse, in the other, human. Therefore, this difference must be a distinctness belonging to the kind. For by "difference belonging to the kind" I mean a distinctness that makes the kind itself distinct.

This difference, therefore, will be a contrariety (as is also clear from induction); for all things are divided by opposites, and it has been proved[446] that contraries are in the same kind; for contrariety was seen to be complete difference, and all difference in form is difference from something, in something, so that this latter thing is the same for both and is their kind (which is also why all contraries that are different in form

446. 10.4.

and not in kind are in the same column of predication and are most distinct from each other—for the difference is a complete one—and do not come to be at the same time as each other). Therefore, the difference is a contrariety.

This, therefore, is what it is for things to be distinct in form, to have a contrariety while being in the same kind, and to be indivisible (while those things are the same in form that do not have a contrariety and are indivisible); for contrarieties arise in the process of division even in the intermediates before one comes to the indivisibles. So it is apparent that in relation to what is called the "kind" none of the forms as forms of a kind is the same as it in form or distinct from it in form, and this is as it should be; for the matter is indicated by negation, and the kind is the matter of what it is said to be the kind of—not as in the Heraclidae kind[447] but as in the kind that is included in the nature of that thing. And neither is any of them so with reference to things that are not in the same kind, but will instead differ from them in kind and differ in form from those in the same kind; for the difference belonging to what differs in form must be a contrariety; and this belongs only to things in the same kind.

10.9
The Case of Female and Male

One might raise a puzzle as to why a woman does not differ in form from a man, when female and male are contrary and their difference is a contrariety, and why a female and a male animal are not distinct in form either, and yet this difference belongs intrinsically to the animal, and not as paleness or darkness does, but rather it is insofar as it is animal that both female and male belong to it.

This puzzle is pretty much the same as the other one, namely, why one contrariety makes things distinct in form and another does not—for example, the footed and the winged do, while paleness and darkness do not. Or is it that the former are affections that properly belong to the kind, while the latter are less so? Or is it that, since one component is the account and the other the matter, contrarieties that are in the account produce a difference in form, but those that are in the combination with the matter do not produce one? That is why a human's paleness or darkness does not produce a difference in form, nor is there a difference as regards form between the pale human and the dark human, not even if a single name is assigned to them. For it is as matter that the human is considered here, and matter does not produce a difference; for the [particular] humans are not forms of human because of it, and yet the parcels of flesh and the bones of which this human and that one consist are distinct. By contrast, the compound is a distinct one, but not distinct in form, because in the account there is no contrariety.

And this [form in whose account there is no contrariety] is the ultimate indivisible. Callias, by contrast, is the account with the matter; so too, then, is the pale

447. The family consisting of the descendants of Heracles.

human—because Callias is pale, and so the human is such coincidentally. Neither, then, do a brazen circle and a wooden one differ in form; nor do a brazen triangle and a wooden circle do so because of the matter, but because there is a contrariety present in the account.

But does the matter, when it is in a certain way distinct, not make things distinct in form, or is there a way in which it does? For why is this horse distinct in form from this human, and yet the accounts of them are together with the matter? Or is it that there is a contrariety present in the account? For there is also a contrariety between the pale human and the dark horse, and one in form indeed, but not insofar as one is pale and the other dark, since even if both had been pale, they would have been distinct in form nonetheless.

Male and female, however, are affections that do properly belong to the animal, not in virtue of its substance but in the matter—that is, the body. That is why the same seed becomes female or male when it is affected in regard to a certain affection.

What it is to be distinct in form, then, and why some things differ in form, while others do not, has now been stated.

10.10
Things Capable and Things Incapable of Passing Away Must Be Distinct in Kind

Since contraries are distinct in form, and the capable of passing away and the incapable of passing away are contraries (for a privation is a definite incapacity), the capable of passing away and the incapable of passing away must be distinct in kind.

Up to now we have been speaking of the universal names themselves, so that perhaps it might seem not to be necessary for whatever is incapable of passing away and whatever is capable of passing away to be distinct in form, just as with pale and dark (for the same thing can be both, and, at the same time, if it is a universal, just as the human can be both pale and dark, and, if it is a particular, it can still be both; for the same human can also (but not at the same time) be pale and dark, and yet the pale is contrary to the dark).

But then while some contraries belong to certain things coincidentally (for example, both those just mentioned and many others), others are incapable of it, among them the capable of passing away and the incapable of passing away; for nothing is coincidentally capable of passing away; for the coincidental admits of not belonging to something, while the capable of passing away is among the things that belong of necessity to what they belong to—or else one and the same thing will be capable of passing away and incapable of passing away, if the capable of passing away admitted of not belonging to it. Therefore, the capable of passing away must either be the substance or be in the substance of each thing capable of passing away. And the argument is the same in the case of things incapable of passing away; for both are affections that belong to something of necessity. Therefore, insofar as, and with reference to the primary thing

[due to which] one thing is capable of passing away and another incapable of passing away, they have an antithesis, so that it is necessary for them to be distinct in kind.

It is evident, therefore, that there cannot be Forms of the sort some people say there are; for then it would be the case that one man is capable of passing away and another incapable of passing away.[448] And yet the Forms are said to be the same in form with the particulars and not merely to have the same name. But things that are distinct in kind are further apart than those that are distinct in form.

BOOK 11 (KAPPA)[449]

11.1
Puzzles from 3.1 Revisited ($P_{1–8}$)

It is clear from our first discussions,[450] in which we went through the puzzles related to other thinkers' statements about the starting-points, that theoretical wisdom is a sort of science concerned with starting-points. [P_1] But one might raise a puzzle as to whether theoretical wisdom should be supposed to be one science or many; for if it is one, one science is always of contraries, but the starting-points are not contraries; but if it is not one, of what sort should one assume these to be?

[P_2] Further, is it for one science or for more than one to get a theoretical grasp on the starting-points of demonstrations? For if for one, why of this science rather than of any other? But if for more than one, of what sort must these be assumed to be?

[P_3] Further, is it of all substances or not? For if not of all, it is difficult to say of which. But if there is one science of all, it is unclear how it is possible for the same science to be of more than one.

[P_4] Further, is it concerned with substances alone or also with their [intrinsic] coincidents? For if in the case of the [intrinsic] coincidents, there is demonstration, in the case of the substances, there is not. But if the sciences of the two are different, what science is each of the two, and which one is theoretical wisdom? For insofar as[451] it is demonstrative, the science concerned with the [intrinsic] coincidents[452] is theoretical wisdom, while insofar as it is concerned with the primary things, it is

448. I.e., the man-itself.

449. This book is not unambiguously referred to in any other book of the *Metaphysics* but refers to the contents of 1.3–10 and, though less certainly, to those of 12.6–7. It consists of two quite different parts: (1) 1059ᵃ18–1065ᵃ26 contains a shorter version of the contents of Books 3, 4, and 6. (2) 1065ᵃ26–1069ᵃ14 contains a series of extracts taken almost verbatim from Books 2, 3, and 5 of the *Physics*. The two parts are joined together by a transition from a discussion of the coincidental to a discussion of chance.

450. 1.3–10.

451. Reading ᾗ . . . ᾗ.

452. Reading ἀποδεικτική, σοφία ἡ περὶ τὰ συμβεβηκότα.

the science of substances. But one must not assume, either, that the science being inquired about is concerned with the causes mentioned in our studies concerning nature; for it is not concerned with the for-the-sake-of-which (for the good is a thing of this sort, and it belongs among the things doable in action and the beings involved in movement). And this is what first moves things (for the end is a thing of this sort), but in the case of immovable things there is no thing that moved them first.

[P_{5a}] And, in general, there is a puzzle as to whether the science now being inquired about is really concerned with the perceptible substances or not with them but with certain others. For if it is concerned with others, it must be concerned with the Forms or concerned with the objects of mathematics.

[P_6] That the Forms do not exist is clear. Nonetheless,[453] there is a puzzle—even if someone posits that they do exist—as to why precisely what holds in the case of the other things of which there are Forms does not hold in precisely the same way in the case of the objects of mathematics. I mean that these thinkers posit the objects of mathematics as intermediate between Forms and perceptibles as a third sort of thing beyond both the Forms and the things here, but there is not a third human or horse beyond both the thing-itself and the particulars. But if it is not as they say, what must one posit as the sort of thing that the mathematician busies himself with? For it is certainly not with the things here; for none of these is the sort of thing that the mathematical sciences inquire about. [P_{5b}] But the science being inquired about is not concerned with the objects of mathematics either (for none of them is separable), nor about the perceptible substances; for they are capable of passing away.[454]

[P_7][455] In general, one might raise a puzzle about what sort of science it does belong to to go through puzzles about the matter of the objects of mathematics. For it does not belong to natural science, because the natural scientist's entire study is concerned with things that have within themselves a starting-point of movement and of rest, nor yet to the science that investigates demonstration and scientific knowledge; for this is the kind of thing that it produces its investigation about. It remains, therefore, that it is the philosophy proposed here that conducts the investigation into those issues.[456]

[P_8] One might raise a puzzle too about whether one should posit that the science being inquired about is concerned with the starting-points, those that some people call "elements," which everyone posits as components of composite things. But it might seem that the science being inquired about must rather be of universals; for every account and every science is of universals and not of last things,[457] so that it would thus be of the primary kinds.[458] But these would turn out to be being and one; for these might most of all be supposed to encompass all the beings and to be most

453. Reading ὅμως.
454. 1025^{b}18–1026^{a}32.

457. I.e., particulars.
458. I.e., the categories.

like starting-points due to being primary in nature; for when they pass away, the rest are done away with along with them; for everything is a being and is one. But insofar as, if one posits these as kinds, their differences must participate in them, while no difference participates in its kind, in this way it would seem that one should not posit them as kinds or as starting-points.

Further, if what is simpler is more of a starting-point than what is less so, and the ultimate things of which the kind is composed are simpler than the kinds (for the former are indivisible, while the kinds are divided into many different forms), the forms would seem to be starting-points more than the kinds. But insofar as the forms are done away along with the kinds, the kinds seem more like starting-points; for something that does away with something along with itself is its starting-point.

1060ᵃ1 The things that involve puzzles, then, are these and others of the sort.

11.2
More Puzzles from 3.1 Revisited ($P_{9–16}$)

[P_9] Further, should one posit something beyond the particulars or not, or is it rather these particulars that the science being inquired about is the science of? But they are unlimited in number. Yet the things that are beyond the particulars are kinds and forms, while the science we are now inquiring about is of neither of these. Why this is impossible has been stated.[459]

[P_{10}] For in fact there is, in general, a puzzle as to whether one should suppose that there is some separate substance beyond the perceptible substances (that is, those here), or not, but rather that these are the beings and that theoretical wisdom is concerned with them. For we seem to be inquiring about another sort of substance, and that this is what we proposed to ourselves here[460]—I mean, to see whether there is something intrinsically separable that belongs to none of the perceptibles.

Further, if beyond the perceptible substances there is some other substance, which sorts of perceptibles should one posit this to be beyond? For why is it more so beyond the humans or the horses that one should posit this than beyond the other animals or even the inanimate things generally? But to set up other eternal substances equal in number to the perceptible ones that are capable of passing away would seem to fall outside the bounds of what is reasonable.

But if the starting-point now being inquired about is not separable from the bodies, what other starting-point could one better posit it to be than matter? But this does not exist actively but potentially.[461] And the form and the shape would seem to be a more controlling starting-point than matter. The form, though, is capable of passing away, so that there is no eternal substance at all that is separable and intrinsic. But this

459. 1059ᵇ31–38.
460. 1059ᵇ20–21.
461. 1042ᵃ27–28, 1048ᵃ35–ᵇ9.

is absurd; for there seems to be such a thing, and it is inquired about by pretty much all the most sophisticated thinkers as being a starting-point and substance of this sort; for how will there be order without there being something eternal and separable and enduring?[462]

[P_{11}] Further, if indeed there is a substance and starting-point of the sort of nature that we are now inquiring about, and if this is one for all things, and the same for both eternal things and things capable of passing away, there is a puzzle as to why precisely, if the starting-point is the same, some of the things that fall under the starting-point are eternal, while others are not eternal (for this is absurd). But if there is one starting-point of the things that are capable of passing away and another of the eternal things, and if that of the things that are capable of passing away is also eternal, we will face a similar puzzle (for why, if the starting-point is eternal, are the things that fall under the starting-point not also eternal?); but if it is capable of passing away, there will be some other starting-point of this starting-point, and another of that one, and this will go on without limit.

[P_{12}] Again, if one is to posit [as starting-points] those that seem most of all to be immovable starting-points, namely, being and one, then, first, if each of these does not signify a this something and substance, how will they be separable and intrinsic? **1060^{b}1** But these are the sorts of eternal and primary starting-points that we are inquiring about. But if each of the two does indicate a this something and a substance, all the beings will be substances; for being is predicated of all things (as of some things one is as well). But that every being is a substance is false. Further, in the case of those who say that the primary starting-point is the one, and that this is substance, and who from the one and the matter generate, in the first place, number, and say that this is substance, how can what they say possibly be true? For how is one supposed to understand the two and each of the rest of the composite numbers as one? About this they say nothing, nor is it easy to say anything.

[P_{13}] But if one is to posit lines or the things that come after them (I mean the primary surfaces[463]) as starting-points, these at least are not separable substances, but cuts and divisions, some of surfaces, others of bodies (while points are cuts or divisions of lines), and further, limits of these same things. But all these are present in other things, and none is separable. Further, how should one suppose there to be a substance of one and of point? For there is a coming to be of every substance, but there is no coming to be of a point; for a point is a division.

[P_{14}] A puzzle is also raised by the fact that every science is of the universals and of the such-and-such sort of thing, but the substance is not among the universals, but is rather a this something and separable, so that if there is a science that is concerned with the starting-points, how should one suppose the starting-point to be substance?

462. 1075^{b}24–27.
463. *DA* 404^{b}19–21.

[P15] Further, is there anything beyond the compound or not (I mean, the matter and what is with it[464])? For if not, things that are in matter are all capable of passing away. But if there is something, it would be the form and the shape. In which cases this is beyond the compound, however, and in which it is not, is difficult to determine. For in some cases it is clear that the form is not separable—for example, that of a house.

[P16] Further, are the starting-points the same in form or number? For if they are so in number, all things will be the same.

11.3
4.1–2 Revisited

Since the science of the philosopher is of being qua being universally and not in part, and since things are said to *be* in many ways, not in one, it follows that if they are said to *be* homonymously and with reference to nothing common, they do not fall under one science (for there is no kind of such things), while if it is with reference to something common, they will fall under one science.

It certainly seems that things are said to *be* in the way mentioned, like medical and healthy; for we also say that things are said to *be* each of these in many ways. **1061ᵃ1** And each thing is said to *be* so in the relevant way—in the one case with some sort of reference to the science of medicine, in the other to health, in others to other things, but in each case to the same thing. For an account and a knife are said to be medical because the former comes from the science of medicine and the latter is useful to it. It is the same way with healthy; for one thing is said to be such because it is indicative of health, another because it is productive of it. And it is the same way too in the rest of the cases.

It is in this way, then, that everything is also said to *be*; for each of them is said to *be* because it is an affection of being qua being, or a state, disposition, or movement of it, or something else of this sort. And since every being is referred to something that is one and common, each of the contrarieties too will be referred to the primary differences and contrarieties of being, whether the primary differences of being are the many and the one or similarity and dissimilarity, or some other differences. Let these be taken as already theoretically grasped. And it makes no difference whether what is is referred to being or referred to one. For even if these are not the same but distinct, they are convertible, at any rate; for what is one is in a way also a being, and what is a being, one.

But since every pair of contraries is to be theoretically grasped by one and the same science, and in each pair one member is said of things with reference to the privation of the other (and yet in the case of some contraries one might raise a puzzle

464. 1058ᵇ10–11.

as to how they can be said of things with reference to a privation, those that have an intermediate, like just and unjust), in all such cases, therefore, one must posit that the privation is not of the whole account but of the complete form. For example, if the just man is, in accord with a state [of character], obedient to the laws, the unjust one will not in every case be the one who is deprived of the whole account, but may be merely in some respect deficient in obedience to the laws, and it is in this respect that the privation will belong to him, and it is the same way in other cases.

But just as the mathematician makes his theoretical investigation about things that result from abstraction (for he gets his theoretical grasp on them having first stripped away all the perceptible affections—for example, weight and lightness, hardness and its contrary, and further, also heat and cold, and the other perceptible contrarieties—and leaves behind only the quantitative and the continuous, sometimes in one, sometimes in two, sometimes in three dimensions, and the affections of things insofar as they are quantitative and continuous, and does not get a theoretical grasp on any other aspect of them, but investigates the relative positions of some and what belongs to them, and the commensurabilities and incommensurabilities of others, and the ratios of others still, but nonetheless we posit one and the same science of all of these: geometry), it is the same way too with being. For to get a theoretical grasp on the [intrinsic] coincidents of this qua being, and on the contrarieties that belong to it qua being, belongs to no other science than philosophy. For to natural science one would assign the task of producing theoretical knowledge not of the beings qua beings, but qua having a share in movement. But dialectic and sophistry, although they are concerned with the coincidents of things, are not concerned with them qua beings, or with being itself qua being. So it remains that it is the philosopher who is capable of theorizing about the things mentioned qua being.

But since everything is said to *be* with reference to something that is one and common, although so said in many ways, and contraries are in the same position (for they are referred to the primary contrarieties and differences in being), and since things of this sort can fall under one science, the puzzle stated at the start[465] would seem to be resolved—I mean the puzzle as to how there can be one single science of beings that are many and different in kind.

11.4
Parts of 4.3 Revisited

Since even the mathematician makes a special use of the common things,[466] it must belong to primary philosophy to get a theoretical grasp on these starting-points also. For that when equals are subtracted from equals the remainders are equal is common

465. $1059^{a}20–23$.

466. I.e., beliefs or axioms common to all or to many sciences. See $996^{b}26–997^{a}11$.

to all quantities, but mathematics, having cut off a part of its proper [subject-]matter, proceeds to produce theoretical knowledge about this part (for example, about lines or angles or numbers or some other sort of quantity)—not, however, qua beings, but insofar as each of them is continuous in one, two, or three dimensions. But philosophy does not investigate beings in part, or insofar as each of them has some coincident, but it investigates being, and each thing of that previous sort qua being.

Natural science too has the same way of inquiring as mathematics; for natural science gets a theoretical grasp on the [intrinsic] coincidents and starting-points of the beings insofar as they are moving and not qua beings (while the primary science, we said, is concerned with these, only insofar as the underlying subjects are beings, and not insofar as they are anything else). That is why both this science and mathematical science must be assumed to be parts of theoretical wisdom.

11.5
Parts of 4.3 Revisited

There is a starting-point in the beings that one cannot be deceived about, but must always be doing the opposite, I mean, be grasping the truth—that the same thing cannot at one and the same time be and not be, or admit of any other opposites in this way. And while there is no unconditional demonstration of such things, against a given person there is one; for it is not possible to produce a deduction of this from a more persuasive starting-point, and yet we, at any rate, must do so, if indeed one is to demonstrate it unconditionally. But to prove to the person who makes opposite affirmations that he speaks falsely, one must get the sort of thing from him that will be the same as that it is not possible for the same thing to be and not to be at the same time, but that will not seem to be the same; for only in that way can a demonstration be given to the person who states that opposite affirmations can be truly made about the same thing.

Those, then, who are going to join in argument with each other must to some extent comprehend each other; for if this does not happen how will there be a joining in argument with each other for these people? Therefore, each of the names must be known and must make something clear, and not many things, but only one. And if the name signifies more than one thing, it must be made evident to which one of them it is being applied.

[A_1] The person, then, who says it is this and it is not this, says and denies that it is this, so that what the name signifies, he says it does not signify; and this is impossible. And so, if indeed "it is this" signifies something, it is impossible for its contradictory to be true of the same thing.

[A_2] Further, if the name signifies something and this states the truth, it must be that this is so of necessity. And what is so of necessity cannot for the relevant time not

be so. Therefore, it is not possible for opposite affirmations to state the truth about the same thing.

[A_{3a}] Further, if the affirmation no more states the truth than the negation, the person who says [it is] a human no more states the truth than the one who says [it is] not a human. And yet it would also seem that in saying that a human is not a horse, a person would be stating the truth either more or less than in saying that [it is not] a human, so that he will also be stating the truth in saying that the same thing is a horse (for the assumption was that opposite affirmations equally state the truth). It follows, therefore, that the same thing is a human, a horse, or any other animal.

None of these is an unconditional demonstration; nonetheless, it is a demonstration to someone who posits the relevant things. And maybe if one had questioned Heraclitus himself in this way one would have compelled him to agree that opposite affirmations can never state the truth about the same things. But as things stand, he took up this belief without himself hearing what he was saying.[467]

[A_{3b}] In any case, if what is said by him is true, not even this itself will be true—I mean, that it is possible for the same thing at one and the same time to be and also not to be; for just as, when separated, the affirmation no more states the truth than the negation, so in the same way—because the combined and complex affirmation is like a single affirmation—the negation will no more state the truth than the whole taken as an affirmation.

[A_4] Further, if nothing can be affirmed truly, this will itself be false: the affirmation that there can be no true affirmation. But if there is a true affirmation, this would refute what is said by those who object to such things and utterly do away with discussion.

11.6
Parts of 4.4–5 Revisited

The saying of Protagoras is much the same as the views mentioned;[468] for he in fact said that man is the measure of all things, which is saying nothing other than that what seems so to each person also assuredly is. But if this is so, it follows that the same thing both is and is not, and is both bad and good, and all the other things that are said in accord with opposite affirmations, because often a given thing appears beautiful to some people and the contrary to others, and what appears to each is the measure.

This puzzle may be resolved by getting a theoretical grasp on where the starting-point of this supposition has come from; for in some cases it seems to have come about from the belief of the natural scientists, and in others from the fact that not

467. $1005^{b}23–26$.
468. $1009^{a}6–16$.

all people have the same knowledge about the same things, but rather a given thing appears pleasant to some and the contrary to others.

It is a belief common to pretty much all those concerned with nature that nothing comes to be from what is not, but everything from what is. Since, then, nothing white comes to be from what is completely white (that is, what is in no way not white), what becomes white must come to be from what is not white, so that it must come to be from what is not, according to them, unless the same thing was white and not white at the start. It is not difficult to resolve this puzzle; for it was said in our studies concerning nature[469] how things that come to be do so from what is not and how they do so from what is.

But to attend equally to the beliefs of, and the ways things appear to, the disputing parties is simple-minded; for it is clear that one of them must be deceived. This is evident from what happens as regards perception; for the same thing never appears sweet to some people and the contrary to others, unless in one case the perceptual organ for discerning the flavors mentioned is destroyed or injured. And if this is so, the other must be supposed to be the measure and the one must not be supposed to be the measure. And I say the same in the case of good and bad, beautiful and ugly, and other things of this sort. For maintaining the other view is no different from maintaining that what appears to people who press their finger below their eye and make a thing appear to be two instead of one must be two,[470] because it appears to be so, and again one; for to those who do not interfere with their sight the one thing appears to be one.

In general, it is absurd for the fact that the things here are manifestly changing and never remain the same to be made the basis of judgment about the truth; for it is the things that are always in the same state and never undergo change that should be made the basis when pursuing the truth, and this is the sort of thing that the heavenly bodies are; for these are manifestly not now of such-and-such a sort and again of another sort, but are always the same and share in no change.

Further, if there is movement, there is also something moved, and everything is moved from something to something. Therefore, what is moved must first be in that from which it is moved and then not be in it, and must move to the other and come to be in it, and the contradictories must not be true of it at the same time, as our opponents claim they are.

And if with respect to quantity the things here continuously flow and move (that is, if one were to posit this even though it is not true), why should they not remain the same with respect to quality? For the predication of contradictories of the same thing seems to have come about largely from the supposition that quantity does not remain the same in the case of bodies, which is why our opponents say that the same

469. *Ph.* 1.6–9, *GC* 317b14–319b5.
470. *Insomn.* 461b31–462a2.

thing both is and is not four cubits long. But the substance depends on quality, and this is of a definite nature, while quantity is of an indefinite one.

Further, when the doctor prescribes the taking of this food [on the assumption that it is bread] why do they take it? For in what way is it bread rather than not bread? And so it should make no difference whether they eat it or do not eat it. But in fact, supposing themselves to know the truth about it and it to be the food prescribed, they take the food. And yet there was no necessity to do so, if no nature assuredly remains the same in perceptible things, but all of them are always moving and flowing.

Further, if we are always altering and never remain the same, is it any wonder that to us, as to the sick, things never appear the same? For to them too, because their state is not in the same condition as when they were healthy, perceptible things do not **$1063^{b}1$** appear the same. And yet this certainly does not make the perceptible things themselves share in any change, though they do produce different perceptual affections in the sick and not the same ones. For it to be the same way, then, with us too, if the change mentioned occurs, is equally necessary. But if we do not change but continue as we were, there will be something that remains the same.

In the case of those who raise the puzzles mentioned on the basis of argument, it is not easy to provide a resolution, unless they posit something for which they no longer demand an argument; for it is in this way that all argument and all demonstration comes about; for if they posit nothing, they do away with discussion and with argument in general. So with people of this sort there is no arguing. But in the case of those who are puzzled by the traditional puzzles, it is easy to confront and resolve what causes the puzzles in them—as is clear from what has been said.[471]

So it is evident from these considerations that opposite affirmations cannot state the truth about the same thing at one time, nor can contrary ones, because all contraries are said of things as a privation—as is clear if we lead the account of contraries back to their starting-point.

Similarly, nothing intermediate between contraries can be predicated of one and the same thing [as one of the contraries]; for if the underlying subject is white, in saying that it is neither black nor white, we will be stating a falsehood; for then it follows that it is white and not white; for the second of the two things that have been combined is truly stated of it, and this one is the contradictory of white.

Neither, then, in speaking in accord with Heraclitus[472] or in accord with Anaxagoras[473] is it possible to speak the truth; if it were, it would follow that contraries are predicable of the same thing; for when Anaxagoras says that there is a part of everything in everything, he is saying that nothing is sweet any more than it is bitter, and similarly for the other sorts of contraries, if indeed everything is present in everything, not potentially only but actively and separately.

471. $1062^{b}20$–$1063^{a}10$.
472. $1062^{a}31$–$^{b}7$.
473. $1063^{b}26$–30.

Similarly, all affirmations cannot be false nor all true, both because of many other difficulties that might be assembled as being due to this thesis and because, if all are false, it will not be true to state even it, while, if all are true, it will not be false to state that all are false.

11.7
6.1 Revisited

Every science inquires about certain starting-points and causes for each of the things of which it is the science—for example, medicine and athletic training and each of
1064a1 the rest of the sciences whether productive or mathematical. For each of these marks off a certain kind and busies itself with it, as something that exists and is a being, although not qua being; instead, the science that does this is another science that is beyond the former ones. And each of the sciences just mentioned somehow gets hold of the what-it-is in each kind and tries to prove the rest in a weaker or more exact way. Some get hold of the what-it-is through perception, others by hypothesizing it, which is why it is clear from an induction of this sort that there is no demonstration of the substance or the what-it-is.

However, since there is a science concerned with nature, it is clear that it must be distinct both from practical and from productive science. For in the case of productive science the starting-point of movement is in the producer and not in the product, and is either a craft or some other sort of capacity. Similarly, in practical science too the movement is not in the action done but in the doer of the action.[474] But the natural scientist is concerned with things that have within themselves a starting-point of movement. It is clear from these considerations, therefore, that natural science is neither practical nor productive but theoretical (for it must fall in some one of these kinds). And since each of the sciences must somehow know the what-it-is and use it as a starting-point, one must not fail to notice the way the natural scientist must define things and the way he must get hold of the account of the substance—whether like snub or like concave. For of these the account of the snub is said together with the matter of the thing, while that of the concave is said separate from the matter; for it is in a nose that the snubness occurs, which is why the account of it is theoretically grasped together with this; for the snub is concave nose. It is evident, then, that the account of flesh too and of the eye and of the other parts must always be given together with the matter.

Since there is a science of being qua being and separable, it must be investigated whether this must be assumed to be the same as natural science or rather as distinct from it. Natural science is concerned with things that have a starting-point of movement within themselves, while mathematics is theoretical and is a science of things that

474. 1050a34–b3.

remain the same, but are not separable. Concerning things that are separable, therefore, and immovable, there is a science distinct from both of these—if indeed there is some substance of this sort (I mean separable and immovable), which is precisely what we will try to prove.[475] And if indeed there is a nature of this sort among the beings, there is where the divine too would surely be, and this would be the primary and most controlling starting-point. Therefore, it is clear that there are three kinds of theoretical sciences—natural, mathematical, and theological. The best kind of science, then, is that of the theoretical sciences, and of these themselves the last named one; for it is concerned with the most estimable of the beings, and each science is said to be better or worse in accord with the scientifically knowable object that properly belongs to it.

One might raise a puzzle, however, as to whether or not the science of being qua being should be posited as universal at all. For each of the mathematical sciences is concerned with some one definite kind, while universal mathematics is common, concerned with all alike. If, then, the natural substances are primary among the beings, natural science will also be primary among the sciences, but if there is another nature and substance, separable and immovable, the science of it must be distinct from and prior to natural science, and universal by being prior.

11.8
6.2–4 Revisited

Since there are several ways in which something is said to *be* unconditionally, of which one is being said to *be* coincidentally, what it is to be in this way must first be investigated. But that none of the traditional sciences busies itself with the coincidental is clear; for building does not investigate what coincidentally happens to those who will use the house (for example, whether they will live painfully in it or in the contrary way), and weaving, or shoemaking, or gourmet cooking does not [investigate such things] either. Instead, each of these sciences investigates what is intrinsically special to it, and this is the end that properly belongs to it. And as for the argument that when the person who is musical becomes grammatical[476] he will become both at the same time, not having been both before, and that what is, not always having been, must have come to be, so that he must at the same time have become musical and grammatical—that none of the agreed on sciences inquires about except sophistic; for it alone busies itself with the coincidental. That is why Plato was not wrong when he used to say[477] that the sophist spends his time on what is not.

But that it is not even possible for there to be a science of the coincidental will be evident if we try to see what the coincidental really is. We say, then, that everything either is always and of necessity (not in the sense in which something is said to be

475. 12.6–7.
476. Secluding οὐδὲ μουσικὸν καὶ γραμματικόν.
477. E.g., *Sophist* 254a.

forced, but in that which we employ in connection with demonstrations), or is for
35 the most part, or is neither for the most part nor always and of necessity, but as luck would have it—for example, there might be cold weather in the dog days, but this occurs neither always and of necessity nor for the most part, but it might occur
1065ᵃ1 sometimes. The coincidental, then, is what occurs, but neither always nor of necessity nor for the most part. What the coincidental is, then, has been stated, and why there is no science of such a thing is clear; for every science is of what always or for the most
5 part is, but what is coincidental is included in neither of these.

And that there are not causes and starting-points of the coincidental of the same sort as there are of the intrinsic is clear; for if there were, everything would be of necessity. For if A is when B is, and B is when C is, and if C is, not as luck would
10 have it, but of necessity, what C was cause of will be of necessity, down to the last thing that is said to be caused (but this was supposed to be so coincidentally). So all things will be of necessity, and both what occurs as-luck-would-have-it and what admits of coming to be and of not doing so will be entirely eliminated from the things that come to be. And if one supposes the cause not to exist already but to be coming to be, the same results will follow; for everything will come to be of
15 necessity. For tomorrow's eclipse will occur if A occurs, and A if B occurs, and B if C occurs; and in this way, if one keeps on subtracting time from the finite time between now and tomorrow, one will come at some time to what already exists,
20 so that since this exists, everything after it will occur of necessity, so that all things occur of necessity.

As for being as being true[478] and being coincidentally, the former depends on a combination in thought and is an affection of thought (which is why the starting-points of this way of being are not inquired about, but about being that is external[479] and separable), while the latter is not necessary but indefinite
25 (I mean, the coincidental), and of something like that the causes are unordered and unlimited.

The for-the-sake-of-which is found in things that come about by nature or as a result of thought, and it is luck when one of these things comes about coincidentally; for just as being is either intrinsic or coincidental, it holds likewise for
30 cause. And luck is a coincidental cause in things that come about in accord with deliberate choice for the sake of an end, which is why luck and deliberate choice are concerned with the same things, for deliberate choice does not exist separate from thought. The causes from which things due to luck might come about are indefinite, which is why luck is unclear to human rational calculation and a cause coincidentally, and is not unconditionally a cause of anything. It is good or bad
35 luck when the result is good or bad, and is good or bad fortune when these are of
1065ᵇ1 a certain magnitude.

478. 6.4.
479. I.e., to the mind. Cf. 1028ᵃ2.

Since nothing coincidental is prior to the intrinsic, coincidental causes are not either. Therefore, if luck or chance is a cause of the heaven, understanding and nature are causes prior to it.

11.9
Parts of Physics *3 Recapitulated: Movement*

Some things *are* actively only, some potentially, some potentially and actively—in one case being a this something, in another a quantity, or one of the rest. There is no movement beyond the things [that are being moved]; for change is always in accord with the categories of being, and there is nothing that is common to these and in no one category. But each of the categories belongs to all its members in two ways. For example, the this—one is the shape, the other its privation; as regards quality—one is white, the other black; as regards quantity—one is complete, the other incomplete; and as regards spatial movement—one is up, the other down, or one is [of what is] light, the other [of what is] heavy. So there are as many forms of movement and change as there are of being.[480]

Since there is a division in each kind between what is potential and what is actual, the activation of what is potential, insofar as it is such, is what I say movement is. And that what we say is true is clear from the following; for when the buildable, insofar as it is what we say it is, is active, it is being built, and this is building. It is the same way with learning, curing, walking, leaping, aging, and ripening. Movement exists when the actuality itself does, and neither earlier nor later. The actualization, then, of what is potential, when it is actually active, not insofar as it is itself but insofar as it is movable, is movement. By "insofar as," I mean this: The bronze is indeed potentially a statue, but nonetheless it is not the actualization of the bronze insofar as it is bronze that is movement. For being for bronze is not the same as being for a certain potential, since if it were unconditionally the same in account, the actualization of the bronze would be a sort of movement. But it is not the same (this is clear in the case of contraries; for to have the potential to be well and to have the potential to be sick are not the same; for if in fact they were, to be well and to be sick would be the same—the underlying subject, though, whether it is healthy or diseased, whether it is liquid or blood, is one and the same). And since it is not the same, just as color and the visible are not the same either, it is of the potential, insofar as it is potential, that the actuality is movement.

It is clear, then, that movement is this, and that it exists when the actuality itself does, and neither earlier nor later. For each thing [of this sort] admits of sometimes being active, sometimes not—for example, the buildable insofar as it is buildable. **1066^{a}1**

480. More exactly stated, there is change with respect to just four categories (substance, quality, quantity, place) and movement with respect to just three (quality, quantity, place). See 1068^{a}8–16.

And the activation of the buildable insofar as it is buildable is building; for the activity is either this—the building—or the house. But when the house exists it is no longer buildable, and what is buildable is what is being built. It is necessary, therefore, for building to be the activity, and building is a sort of movement. And the same account also applies in the case of the other movements.

It is clear from what others say about movement that what we have stated is correct, and from the fact that it is not easy to define it otherwise. For one cannot put it in some other kind. This is clear from what people say; for some say[481] that it is otherness or inequality or not being, none of which is necessarily being moved, and nor is change to these or from these any more than to or from their opposites. What causes people to posit it as these is that movement seems to be something indefinite, and the starting-points in one of the two columns of opposites, because they are privations, are indefinite; for none of them is either a this or a such-and-such sort or any of the rest of the categories. The cause of movement's seeming to be indefinite is that it cannot be posited either as a potentiality of the beings or as an activation of them; for neither what is potentially of a certain quantity nor what is actively of a certain quantity is of necessity moved, and while movement does seem to be a sort of activity, it is incomplete activity. But the cause of this is that the potentiality of which it is the activation is incomplete. And because of this it is difficult to grasp what movement is; for it must be posited either as a privation or as a potentiality or as an activity that is unconditionally such. But manifestly none of these is possible. So the remaining option is that it must be what was said, both an activity and not an activity in the way stated, which, though difficult to visualize, can exist.

And that movement is in the movable is clear; for movement is the actualization of the movable by what can move something. And the activation of what can move something is no other; for there must be the actualization of both; for it can move something by having the potentiality to do so, and it is moving it by being active. But it is on the movable that the mover is capable of acting, so that the activation of both alike is one, just as the interval from one to two or from two to one are the same, or as are the hill up and the hill down, although the being for them is not one. And similarly in the case of the mover and the moved.

11.10
More Parts of Physics *3 Recapitulated: The Unlimited*

The unlimited is either what cannot be traversed because it is by its nature not to be traversed (in just the way the voice is invisible), or what admits only of incomplete traverse, or scarcely admits of it, or what—though by its nature it admits of traverse or limit—is not traversed or limited. Further, something may be unlimited with

481. Plato, *Timaeus* 57e–58a.

respect to addition, to subtraction, or both. But a separable thing is something the **1066ᵇ1**
unlimited certainly cannot be; for if it is neither a magnitude nor a plurality, but the unlimited itself is substance and not a coincident, it will be indivisible (for the divisible is either magnitude or plurality), but if it is indivisible, it is not unlimited, except in the way that the voice is invisible. But this is not the way people use the 5
term nor are we inquiring about it but into the unlimited as untraversable.

Further, how is it possible for the unlimited to intrinsically exist, if number and magnitude, of which the unlimited is an affection, do not? Further, if the unlimited is a coincident, it cannot—insofar as it is unlimited—be an element of the beings, just as the invisible is not an element of speech, and yet the voice is invisible. Also, 10
it is clear that it is not possible for the unlimited to be actively so. For then any part of it that might be taken would be unlimited (for being for the unlimited and the unlimited are the same, if indeed the unlimited is a substance and not an affection of an underlying subject). So it is either indivisible or—if it is capable of having parts—is divisible into unlimiteds. But the same thing cannot be many unlimiteds 15
(for just as air is part of air, so would unlimited be of unlimited, if the unlimited is substance and starting-point). Therefore, it must be incapable of having parts and indivisible. What is actively unlimited, however, cannot be indivisible (for it must be a certain quantity). Therefore, it must belong as a coincident does. But if so, then (as was said) it cannot be it that is a starting-point, but rather that thing with which it is 20
coincident, the air or the even.[482]

This inquiry is universal, but that the unlimited is not found among perceptible things either will be clear from what follows; for if the account of body is what is bounded by planes, there cannot be any unlimited body, whether perceptible or intelligible, nor can there be a number considered as separate and unlimited; for a number or what has a number is numerable. 25

In the context of natural science, this is clear from the following considerations; for the unlimited can neither be composite nor simple. For it cannot be a composite body if the elements are limited in multiplicity (for the contraries must be equalized and no one of them must be unlimited; for if one of the two bodies falls in any way short of the other in capacity, the limited one will be destroyed by the unlimited one; 30
and that each should be unlimited is impossible, for body is what has extension in all directions, and the unlimited is the limitlessly extended, so that if the unlimited is a body, it will be unlimited in all directions).

Nor can the unlimited body be one and simple, whether, as some people say,[483] it is something beyond the elements, out of which they generate these (for there 35
is no such body beyond the elements; for everything can be resolved into what it is composed of, but manifestly not into things beyond the simple bodies), or it is fire or any of the other elements; for apart from the question of how any of them **1067ᵃ1**

482. Anaximenes (984ᵃ5); the Pythagoreans (986ᵃ15–21).
483. I.e., Anaximander.

could be unlimited, the universe, even if it is limited, cannot be or become any one of them—as Heraclitus says[484] that all things at times become fire. The same argument applies also to the one, which the natural scientists put beyond the elements; for everything changes from contrary to contrary—for example, from hot to cold.

Further, a perceptible body is somewhere, and the [proper] place of the whole and of the part is the same, as in the case of the earth. So, if the unlimited body is uniform, it will be immovable or will always be moving. But this is impossible. For why down rather than up or than anywhere else? For example, if there is a clod of earth, where will this move or be at rest? For the proper place of the body that is homogeneous with it is unlimited. Will the clod occupy the whole place, then? And how? What, then, of its rest or movement? Will it be resting everywhere? Therefore, it will not move. Or be moving everywhere? Therefore, it will not rest.

But if the universe has unlike parts, their proper places will also be unlike, and, first, the body of the universe will not be one except by contact, and, second, the parts will be either limited or unlimited in form. But limited they cannot be; for then those of one form will be unlimited and those of another will not (if the universe is unlimited)—for example, fire or water will be unlimited, but something like that will be destructive of their contraries. But if the parts are unlimited and simple, their places are also unlimited, and there will be an unlimited number of elements. But if this is impossible and the places are limited, the universe must be limited too.

In general, there can be neither an unlimited body nor an unlimited [proper] place for bodies, if every perceptible body has either weight or lightness; for it must move either toward the middle or upward, and the unlimited—either the whole or the half—cannot do either; for how can you divide it? Or how will part of the unlimited be down and part up, or part extreme and part middle? Further, every perceptible body is in a place, and there are six forms of place,[485] but these cannot exist in an unlimited body. In general, if an unlimited place is impossible, so is an unlimited body. [And the former is impossible;] for what is in a place is somewhere, and this signifies either up or down or in one of the other directions, and each of these is a sort of limit.

The unlimited is not the same in magnitude, in movement, and in time in the way that some one nature is; rather, the posterior among these is said to be unlimited with reference to the prior—as, for example, a movement is said to be unlimited with reference to the magnitude of the distance covered by an object's movement, alteration, or growth, and time because of the movement.

485. Up, down, left, right, front, back.

11.11
Parts of Physics *5 Recapitulated*

Among things that change, some change coincidentally, as when the musical walks, **1067ᵇ1**
and others are said to change unconditionally, because something in them changes—
for example, in respect of their parts (for the body becomes healthy, because the
eye does), and there is also something that is itself moved directly, and this is the
intrinsically movable. It is the same way in the case of the mover; for it moves some- 5
thing either coincidentally or in respect of a part of itself or intrinsically. But there is
something that directly moves a thing. And there is something that is moved, also the
time during which it is moved, and that from which and that to which it is moved.
The forms, though, and the affections and the places to which moving things are
moved are immovable—for example, scientific knowledge and heat (and it is not heat 10
that is a movement but heating).

Change that is not coincidental is not found in all things but only in contrar-
ies, intermediates, and contradictories. One may be persuaded of this by induction.
Something that changes changes either from an underlying subject to an underlying
subject, or from what is not an underlying subject to what is not an underlying 15
subject, or from an underlying subject to what is not an underlying subject, or from
what is not an underlying subject to an underlying subject (I mean by "underlying
subject" what is indicated by an affirmation), so that there must be three sorts of
changes; for there is no change from what is not an underlying subject to what is not
an underlying subject; for neither are the terms contraries nor is there any contradic- 20
tion, because there is no opposition.

A change from what is not an underlying subject to an underlying subject, the
relation being that of contradiction, is a coming to be—an unconditional coming to
be when the change is unconditional, in a particular respect when the change is in a
particular respect. A change from an underlying subject to what is not an underlying
subject is a passing away—an unconditional passing away when the change is uncon-
ditional, in a particular respect when the change is in a particular respect.

If things are said not to *be* in many ways, and neither what is not by composition 25
or by division nor what potentially is not and is opposed to what unconditionally *is*
admits of movement (for what is not white or not good can still coincidentally admit
of movement, for the not white could be human, while what is unconditionally not a
this can in no way admit of movement), what is not cannot be moved.

And if this is so, coming to be cannot be a movement either; for what is not does 30
come to be; for even if the coming to be is in the highest degree coincidental, still it
is true to say that not being belongs with what is unconditionally coming to be. For
similar reasons, what is not cannot be at rest. These difficulties follow, then, as does
this one, that if everything that is moved is in a place, and what is not is not in a place, 35
[it cannot move]; for if it did it would be somewhere. Passing away is not a movement

either, then; for the contrary of a movement is either another movement or rest, while the contrary of passing away is coming to be.

1068ᵃ1 And since every movement is a sort of change, and the sorts of changes are the three mentioned, and of these, those with respect to coming to be and passing away are not movements, and they are the changes that involve a relation of contradiction, it necessarily follows that only the change from an underlying subject to an underlying subject is movement. The underlying subjects, though, may be either contraries or intermediates (for a privation must also be regarded as a contrary), and are indicated by an affirmation—for example, the naked, toothless, or black.

11.12
More Parts of Physics *5 Recapitulated*

If the categories are distinguished as substance, quality, place, acting on or being acted on, relative, quantity, there must be three movements—of quality, of quantity, of place—but there is no movement with respect to substance, because there is nothing contrary to substance, nor of the relative (for it is possible that when one of the two relata changes the other becomes untrue, though it does not change at all, so that the movement of them is coincidental), nor of acting on and being acted on or mover and moved, because there is no movement of movement nor coming to be of coming to be, nor, in general, change of change.

For there are [just] two ways in which there might be movement of movement: either as an underlying subject (for example, as a human is moved because he changes from pale to dark, so that in this way movement too may be heated or cooled, change its place, or grow; but this is impossible; for a change is not a sort of underlying subject), or else some other underlying subject might change—for example, the human from sickness to health—from one change to some other form [of change]. But this is not possible either, except coincidentally. For every change is from something to something. Coming to be and passing awau are also like that, except that they are to things opposed in one way, while the other—movement—is to things opposed in another way.[486] A thing changes, then, at the same time from health to sickness, and from this change itself to another. It is clear, then, that if it has become sick, it will have changed to whatever the other sort of change may be (for it may remain at rest), and further, never to some random sort. And this new change will be from something to something else, so that this will be the opposite change: becoming healthy. But [we will respond that] this is by coincidence, as there is change from recollecting to forgetting, because what these belong to changes, now to scientific knowledge, now to health.[487]

486. I.e., from one contrary to another.
487. Reading ὑγίειαν.

Further, it will go on without limit, if there is to be change of a change and coming to be of a coming to be. If this is so for the later one, then, it must also be so for the earlier one. For example, if the simple coming to be was at some time coming to be, what comes to be something was also at some time coming to be. So what simply comes to be something was not yet there, but there was already something that was coming to be coming to be something. And this was at some time itself coming to be, and so it was not yet at that time coming to be something else. But since in an unlimited series there is no first term, there will be no first here either, and so neither will there be a following one. Nothing, then, can either come to be or move or change.

Further, the same thing that admits of movement also admits of the contrary movement (and of resting), and of coming to be and passing away. So what is coming to be is passing away when it has come to be coming to be; for it cannot pass away as soon as it is coming to be coming to be something, nor after it has come to be; for what is passing away must be. Further, there must be a matter that underlies what comes to be and changes. What then will it be? What is it that becomes a movement or a coming to be, as a body or a soul is what undergoes alteration? And further, to what do they move? For what it must be the movement or coming to be of is something from something to something. But how can it be? For the process of learning is not of the process of learning, and so no coming to be is of coming to be either.

Since there is no movement either of substance, of the relative, or of acting on and being acted on, it remains for movement to be with respect to quality, quantity, and place (for each of these admits of contrariety). By "quality" I mean not what is in the substance (for even the difference is a quality), but the affective quality in virtue of which a thing is said to be acted on or to be incapable of being acted on.

The immovable, however, is either what is wholly incapable of being moved; or is moved scarcely at all in a long time or is slow in starting to be moved; or what is naturally moved and is capable of being so but is not moved either when, where, or how it should naturally be moved. Among the immovables, the last is the only one I call "at rest"; for rest is contrary to movement, so that it must be a privation in what is receptive of movement.

What are together in place are things that are in one primary place, and what are separate are things that are in distinct primary places. Things are making contact [or touching] when their extremes are together in place. An intermediate is what a changing thing—if it changes continuously[488]—arrives at prior to arriving at the ultimate thing to which, in accord with its nature, it is changing. What are contrary in place are what are most distant in a straight line. What is successive is what is after the starting-point (the order being determined by position or form or in some other way) and has nothing of the same kind between it and what it succeeds—for example, lines in the case of line, units in that of unit, or houses in that of house (but there is nothing to prevent something of some other kind from being in between). For what

488. Omitting τὸ.

is successive is successive of something and is something posterior; for one does not
1069^a1 succeed two, nor the first day of the month the second. What are contiguous are what are successive and making contact. (Since all change is between opposites, and these are either contraries or contradictories, and there is no middle term between contradictories, clearly what is intermediate is between contraries.) Continuity is precisely a sort of contiguity. I mean that two things are continuous when the limits of each, by which they make contact and by which they are kept together, become one and the same. So it is clear that the continuous is found in those things that by nature become one in virtue of their making contact. It is also clear that the successive is primary (for things that are successive do not [necessarily] make contact, but things that make contact are successive; and if things are continuous, they make contact, but if they make contact, they are not necessarily continuous; and in things in which there is no contact, there is no natural unity). So a point is not the same as a unit; for in points there is contact, while in units there is not, but only succession; and while between points there is something intermediate, between units there is not.

BOOK 12 (LAMBDA)[489]

12.1
Substance and Its Varieties

The theoretical investigation [being discussed] is concerned with substance; for it is the starting-points and the causes of substances that are being inquired about. For if in fact we take the universe to be a whole of some sort,[490] substance is its primary part, and if it exists by being a succession,[491] in this way too substance is primary, then quality or quantity. At the same time, these latter things are not (one might almost say) unconditionally beings but qualities and movements—or else even the not-white and the not-straight will be beings (at any rate, we say that even these things *are*—for example, that something *is* not-white[492]). Further, none of the others is separable.

The early philosophers also in effect testify to this; for it was of substance that they were inquiring about the starting-points, elements, and causes. Present-day thinkers posit the universals as substances to a higher degree (for the kinds are universal, and these they say are starting-points and substances to a higher degree, because they inquire in a logico-linguistic way), while thinkers of older days [posit] the particulars, such as fire and earth as substances, but not what is common: body.

489. Text: S. Alexandru, *Aristotle's* Metaphysics *Lambda* (Leiden, 2014).
490. 1016^b12–13, 1052^a22.
491. A view like that of Speusippus. See 1028^b20–27, 1075^b34–1076^a4.
492. 1017^a18–19, 1030^a25–26.

There are three sorts of substances. One is perceptible, of which one sort is eternal and one (which all agree on) is capable of passing away, such as plants and animals; of this it is necessary to grasp the elements, whether one or many. And another sort is immovable, and this certain thinkers say is separable, some dividing it into two, the Forms and the objects of mathematics, others positing these two as one in nature, and others only one of these, the objects of mathematics.[493] The first two sorts belong to natural science (for they involve movement), but the third to another science, if no starting-point is common to these.

12.2
Matter and Change

Perceptible substance is changeable. But if change is from opposites or from intermediates,[494] and not from all opposites (for the voice is not white [but does not change to white]) but from the contrary one, there must be something underlying that changes to the contrary state; for the contraries do not change. Further, while something remains [throughout the change], the contrary does not remain. There is, therefore, some third thing beyond the contraries, the matter. If, then, changes are of four sorts, either with respect to the [this] something, or with respect to the quality, quantity, or place, and if unconditional coming to be and passing away are with respect to the this, growth and withering with respect to quantity, alteration with respect to an affection, spatial movement with respect to place, changes would in each case be to the corresponding contrary states.[495] It is necessary, then, for the matter, which changes, to be capable of both states.

But since being is twofold, everything changes from what is potentially to what is actively—for example, from what is potentially white to what is actively white, and similarly in the case of growth and withering. So not only is it possible, coincidentally, for something to come to be from what is not, but also for all things to come to be from what is—from what is potentially, however, but from what actually is not. And this is one [of the two elements] of Anaxagoras.[496] For it is better than "all things were together,"[497] the "mixture" of Empedocles and Anaximander, and what Democritus says. For us[498] all things were together potentially, but not actively, so that these thinkers would seem to be latching on to matter.

493. Plato (1028^{b}19–20), Xenocrates (1028^{b}24–27), Speusippus (1028^{b}21–24, 1076^{a}20–21).

497. B1 DK. Also, 1056^{b}28–30.
498. Reading ἡμῖν.

All things that change have matter, however, but of distinct sorts.[499] And of eternal things those that do not admit of coming to be but do admit of spatial movement have matter—not matter for coming to be, however, but for movement from where to where.

One might raise a puzzle about what sort of not being coming to be is from; for not being is trifold.[500] If, then, there is something that is potentially something, nonetheless it is not potentially any random thing, but rather distinct things come from distinct things. Nor is it enough to say all things were together; for they differ in their matter; for otherwise why did an unlimited number of things come to be and not one? For the understanding is one, so that if the matter was also one, that thing would have come to be actively which the matter was potentially. The causes, then, are three, and the starting-points three; two of them are the contraries, of which one is the account and the form and the other the privation, and the third the matter.

12.3
Coming to Be and Its Causes

Next, note that neither the matter nor the form comes to be—I mean the ultimate ones.[501] For everything that changes is something, and changes as a result of something, to something. That as a result of which is the direct mover; what changes is the matter; what it changes to, the form. So the process will go on without limit, if not only the bronze becomes round, but the round or the bronze come to be as well. There must, then, be a stopping point.

Next, note that each substance comes to be from something with the same name (for the things that are by nature are substances, and so are the others). For things come to be either by craft, by nature, by luck, or by chance. Craft is a starting-point that is in another thing, while nature is a starting-point in the thing itself (for a human begets a human), and the remaining causes are privations of these.

There are three sorts of substances: the matter, which is a this something [merely] in appearance (for whatever is by contact and not by natural unity is matter and underlying subject); the nature, which is a this something and a certain state toward which; and further, thirdly, the one composed of these which is a particular, such as Socrates or Callias. In some cases the this something is not beyond the composite substance (for example, the form of a house is not, unless as the craft of building, nor is there coming to be or passing away of these, but instead it is in another way that there is or is not a house that is without matter, or health, or anything that is in accord with craft), but if indeed it is so in any, it is in the case of the ones that are by

499. 1042ᵇ5–6.
500. 1067ᵇ25–1068ᵃ7.
501. I.e., the ones that must already be there when production or coming to be begins (1033ᵃ24–ᵇ5).

nature—which is why Plato was not far wrong in saying that there are as many Forms as there are sorts of things that are by nature (if indeed there are Forms other than these)—for example, fire, flesh, head; for these are all matter, and of what is most of all substance, the final matter.[502]

The moving causes are causes in the way preexisting things are, while those that are causes in the way that the account is exist at the same time as what they cause. For it is when the human is healthy that at the same time too the health is there, and the shape of a sphere of bronze is there at the same time as the brazen sphere. (But whether any form remains also afterward must be investigated; for in some cases there is nothing to prevent this—for example, the soul may be like this, not all soul, but rather the understanding;[503] for that all of it should be so is perhaps impossible.)

It is evident, then, that there is no necessity—because of these considerations, at any rate—for there to be the Forms; for a human begets a human, the particular one begetting the particular one; and similarly in case of the crafts; for the craft of medicine is the account of health.

12.4
The Causes and Starting-Points of Distinct Substances Are in a Way the Same

The causes and starting-points of distinct things are distinct in a way, but in a way—if one is to speak universally and analogically—they are the same for all. For one might raise a puzzle as to whether the starting-points and elements of substances and of relatives are distinct or the same, and similarly, then, in the case of each of the categories. But it would be absurd if they were the same for all; for relatives and substances would then both come from the same ones. What, then, will these be? For beyond substance and the other categories of predicables there is nothing common, but an **$1070^{b}1$** element is prior to the things of which it is an element. But then substance is not an element of relatives either, nor is any of these an element of substance. Further, how can all things possibly have the same elements? For none of the elements can be the same as the thing that is composed of elements—for example, A or B as BA (nor, then, is any of the intelligible things an element—for example, being or one; for these also belong to each of the composite things). None of the elements, then, will be either a substance or a relative—but this is necessary.[504] Nor, therefore, do all things have the same elements.

Or, as we say, there is a way in which they do and there is a way in which they do not. For example, perhaps the elements of perceptible bodies are, as form, the

502. E.g., as the head is of the whole animal.
503. *DA* $408^{b}18$–25, $430^{a}23$.
504. Since substance and relative are stand-ins for categories generally ($1070^{a}35$) and nothing can exist if it does not belong to some category.

hot[505] and, in another way, the cold, which is the privation; and, as matter, what is potentially these directly and intrinsically. And both these and the things composed of them are substances, of which these are the starting-points, that is, anything that comes to be from the hot and the cold that is one [something-or-other], such as flesh or bone; for what comes to be from these must be distinct from them. These things, then, have the same elements and starting-points (although distinct things have distinct ones). But that all things have the same ones is not something one can say just like that, although by analogy we can. That is, one might say that there are three starting-points—the form, the privation, and the matter. But each of these is distinct for each category—for example, in color they are white, black, and surface, or light, darkness, and air, out of which day and night come to be.

But since not only the things present in something are causes, but also certain external things, for example, the mover, it is clear that though starting-point and element are distinct, both are causes, and the starting-point is divided into these, while what is so in the sense of moving or causing rest is a sort of starting-point and substance. So analogically there are three elements, and four causes and starting-points. But distinct things have distinct ones, as was said,[506] and the direct cause in the sense of a mover is distinct for distinct things. Health, sickness, body—the mover is the craft of medicine. Form, disorder such as this, bricks—the mover is the craft of building. And since the mover is, in the case of natural things, the one that is the same in form, for example, human for human, and in those that come from thought it is the form or its contrary, there would in a way be three causes, and in a way four. For the craft of medicine is in a way health, and the craft of building is the form of a house, and a human begets a human; further, beyond these there is what as the first of all [movers] moves all things.

12.5
More on the Causes and Starting-Points of Substances

But since some things are separable and others are not separable, the former are substances. And because of this the causes of all things are the same, because without **1071ᵃ1** substances, there are no affections or movements. Next, these causes will presumably be soul and body, or understanding, desire, and body.

Further, there is another way in which the causes are analogically the same: activity and potentiality. But these too are not only distinct for distinct things but also apply to them in distinct ways. For in some cases the same thing is sometimes active and sometimes potential—for example, wine or flesh or human (but these also fall under the causes mentioned;[507] for what is actively is the form, if it is separable, as is what is composed of both [matter and form], as is the privation—for example, darkness or

505. 1040ᵇ5–10.
506. 1070ᵇ17.
507. I.e., form, privation, matter (1070ᵇ25–34).

sickness; but what is potentially is the matter; for this is what is capable of becoming both). But active and potential differ in another way in the case of things whose matter is not the same, of which the form is not the same but distinct—just as, for example, the cause of a human is both his elements, fire and earth as matter and the special form [as form], and further, some other external thing, such as the father, and beyond these the sun and its movement in an inclined circle,[508] which are not matter, form, or privation, and are not the same in form [as father or son], but are movers.

Further, it must be observed that some causes can be stated in universal terms, while others cannot. The this that is first active, and a distinct thing that is potential, are the starting-points of all things. Those things, however, the universal causes, do not exist; for the particular is the starting-point of the particulars; for while human is the starting-point of human universally, there is no universal human—instead, Peleus is of Achilles, and your father of you, and this B of this BA, and B in general of BA unconditionally.

Next, [the causes and elements][509] of substances (but distinct ones of distinct ones) are, as was said, the causes and elements of things that are not in the same kind—of colors, sounds, substances, quantity—except by analogy. And those of things in the same form are distinct, not in form, but because the causes of the particular ones—your matter, form, and mover and mine—are distinct, but in universal account they are the same.

When one inquires, then, about the starting-points or elements of substances, relatives, and qualities, as to whether they are the same or distinct, it is clear that, when they are said of things in many ways, they are the same, but when these are distinguished the starting-points and elements are not the same but distinct—except in this way: and in this way way the causes of all are the same, by analogy, because they are matter, form, privation, and mover; and in this way the causes of substances may be considered as the causes of all things, because if substances are done away with, all things are done away with. Further, the first thing in actuality [is a cause of all things]. In this other way, there are distinct direct causes: the contraries that are neither said of things as kinds nor said in many ways, and further the matters.

What the starting-points of perceptible things are, then, how many they are, and in what way they are the same and in what way distinct has now been stated. **1071**[b]**1**

12.6
The Need for an Eternal Immovable Substance That Is in Essence an Activity

Since there were three sorts of substances, two of them natural and one immovable, concerning the latter it must be said that it is necessary for there to be an eternal immovable substance; for substances are primary among the beings, and if they are

508. *GC* 336[a]23–[b]12.
509. Reading ἔπιτα ἤδη τὰ.

all capable of passing away, everything is capable of passing away. But it is impossible that movement either came into being or passed away (for as we saw[510] it always is), or that time did; for there cannot be a before and an after if there is no time. Movement too is continuous, therefore, in the way that time also is; for time is either the same thing as movement or an affection of it.[511] But there is no continuous movement except movement in place, and of this only that which is circular is continuous.[512]

But then if there is something that is capable of moving things or acting on them, but that is not actively doing so, there will not [necessarily] be movement; for it is possible for what has a capacity not to activate it. There is no benefit, therefore, in positing eternal substances, as those who accept the Forms do, unless there is to be present in them some starting-point that is capable of causing change. Moreover, even this is not enough, and neither is another substance beyond the Forms; for if it will not be active, there will not be movement. Further, even if it will be active, it is not enough, if the substance of it is a capacity; for then there will not be eternal movement; for what is potential may possibly not be. There must, therefore, be this sort of starting-point, one whose substance is activity. Further, these substances must therefore be without matter; for they must be eternal, if indeed anything else is eternal. Therefore, they must be activities.[513]

And yet there is a puzzle; for it seems that everything that is active is capable of being active, while not everything that is capable of being active is active, so that the capacity is prior. But then if this is so, none of the beings will be; for it is possible to be capable of being and not be yet.

And yet if things are as the theologians say, who generate things from Night,[514] or as the natural scientists do who say that all things were together, the same impossibility results. For how will anything be moved if there is not something that is actively a cause? For wood will surely not move itself, but the craft of carpentry will, nor will the menses or the earth move themselves, but the seeds and the semen will.

That is why some thinkers such as Leucippus[515] and Plato[516] posit eternal activity; for they say that there is always movement. But why and what it is they do not say, nor, if the movement is this way or that, what the cause is. For nothing is moved at random, but there must always be some particular sort present—just as, as things stand, a thing moves in one way by nature and in another by force or as a result of understanding or of something else. Further, what sort of movement is primary?[517] This makes an enormous difference. But again in the case of Plato, at any rate, it is

510. *Ph.* 251ᵃ18–28.

517. *Ph.* 8.7.

not possible even to state what he sometimes thinks[518] the starting-point is, namely, what moves itself; for the soul is later than and coeval with the heaven, according to his account. **1072ª1**

To think, then, that capacity is prior to activity is in one way correct and in another way not—and it has been stated how.[519] But that activity is prior is attested by Anaxagoras (for understanding is an activity) and by Empedocles (love and strife), and by those who say that there is always movement, as Leucippus does. So chaos or night did not exist for an unlimited time; rather, the same things existed always (either passing through a cycle of changes or in some other way), if indeed activity is prior to capacity.

If the same thing is always moving cyclically, something [A] must always remain, acting in the same way, and if there is to be coming to be and passing away, there must be something else [B] that is always acting now in one way, now in another.[520] Therefore, this [B] must act in one way intrinsically and in another in virtue of something else—either of a third thing [C], therefore, or of the first [A]. It must, then, be in virtue of this one [A]. For otherwise this [A] again causes the movement of that one [C] and of the other one [B]. Therefore, it is better to say the first [A]; for in fact it was the cause of things always occurring in the same way, and something else the cause of their occurring in another way, and of their always occurring in another way clearly both are the cause. This, therefore, is the way the movements actually take place. Why, then, inquire after other starting-points?

12.7
The Primary God as Immovable Mover

Since it is possible that things are this way, and if they are not this way, they would have come from night, or all things together, or from not being, these issues may be taken as resolved. And there is something that is always moved with an unceasing movement, which is in a circle (and this is clear not from argument alone but also from the facts). So the primary heaven[521] would be eternal. There is, therefore, also something that moves it. But since what is moved and moves something is also something intermediate, there is something that moves without being moved, being eternal, substance, and activity.

And this is the way the object of desire and the intelligible object move things: they move them without being moved.[522] Among these objects, the primary ones are the same. For the [primary] object of appetite is the apparently noble,[523] and the primary

518. *Phaedrus* 245c–246a, *Timaeus* 30a, 34b–c, *Laws* 896a.
519. 9.8.
520. *GC* $336^{a}23$–$^{b}12$.

522. *MA* 6.
523. $1078^{a}31$–32. The point is usually made in terms of the good. See *NE* 3.4.

object of wish is the really noble. But we desire something because it seems [noble] rather than its seeming so because we desire it. For the starting-point is the active understanding. And understanding is moved by the intelligible object, and what is intrinsically intelligible is the one column [of opposites], and in this substance is primary, and in this the one that is simple and in accord with activity [is primary]—but one and simple are not the same; for one signifies a measure,[524] while simple signifies how the thing is. But the noble too, and what is choiceworthy because of itself, are in the same column, and what is primary is always best or analogous to the best.

1072b1 That the for-the-sake-of-which does exist among the immovable things is made clear by a distinction; for the for-the-sake-of-which is both for something and of something,[525] and of these the latter is immovable while the former is not. And it produces movement insofar as it is loved, while it is by something's being moved that it moves the other things.

If something is moved, it also admits of being otherwise than it is, so that if the spatial movement is primary and an activity, insofar as it is being moved, in this respect it admits of being otherwise—with respect to place, even if not with respect to substance. But since there is something that moves while it itself is immovable, though it is in activity,[526] it can in no way admit of being otherwise. For spatial movement is primary among the sorts of change, and of these, that in a circle is primary; and this it produces. Therefore, it of necessity exists; and insofar as it exists of necessity, it is in a noble state, and in this way a starting-point [of movement]. For something is said to be necessary in a number of ways—as what is forced contrary to impulse, as that without which the good does not exist, and as what does not admit of being otherwise, but is necessary unconditionally.

This, therefore, is the sort of starting-point on which the heaven and nature depend. And its pastime is like the best that we can have—and have for a short time (for it is always in that state [of activity], while we cannot be)—since its activity is also a pleasure. And because of this, waking, perceiving, and active understanding are a very great pleasure, and expectations and memories because of these.

Active understanding is intrinsically of what is intrinsically best, and the sort that is to the highest degree best is of what is to the highest degree best. And the understanding actively understands itself by partaking of the intelligible object; for it becomes an intelligible object by touching and understanding one, so that understanding and intelligible object are the same.[527] For what is receptive of the intelligible object and of the substance is the understanding, and it is active when it possesses it, so that the former rather than the latter[528] seems to be [the] divine thing that the understanding possesses, and contemplation seems to be the most pleasant and best thing.

524. 1016b18–21.
525. *DA* 415b2–3.
526. *NE* 1154b26–27.
527. *DA* 429b30–430a7.
528. Reading ἐκεῖνο μᾶλλον τούτου.

If, then, that good state [of activity], which we are sometimes in, the [primary] god is always in, that is wondrous, and if to a higher degree, that is yet more wondrous. And this is his state. And life too certainly belongs to him; for the activity of understanding is life, and his activity is that;[529] and his intrinsic activity is life that is best and eternal. We say, then, that the god is a living being who is eternal and best, so that living and a continuous and everlasting eternity belong to the god; for this is the god.

Those who suppose, as the Pythagoreans and Speusippus do,[530] that the noblest and best is not present in the starting-point, because, while the starting-points of both plants and animals are causes, the noble and complete are in what comes from these, are not correct in their thinking. For the seed comes from other things that are prior and complete, and the first thing is not seed but the complete thing, as one might say the human is prior to the seed—not the one who came to be from it but another one from whom the seed came.

It is evident from what has been said, then, that there is a sort of substance that is eternal and immovable and separate from perceptible things. And it has also been proved that this substance cannot have any magnitude, but must be without parts and indivisible (for it moves something for an unlimited time, and nothing finite has unlimited capacity; and, since every magnitude is either unlimited or finite, it cannot have a finite magnitude, because of what was said, and it cannot have an unlimited magnitude because there is no unlimited magnitude at all). But then it has also been proved that it is impassive and inalterable; for all the other movements are posterior to that with respect to place.

It is clear, then, why things are this way.

12.8
The Number of Immovable Movers and Why There Is Only One Heaven

But one must not overlook whether one substance of this sort must be assumed or several, and, if several, how many. But we must remind ourselves too about the views of the others, that they have said nothing that can even be perspicuously stated about how many they are. For the supposition of Forms contains no special investigation of the issue (for those who accept the Forms say that the Forms are numbers, and where numbers are concerned they sometimes speak as if they were unlimited, sometimes as if, being defined up to ten,[531] they were finite; but about the cause of there being this many numbers nothing is said with demonstrative seriousness). We, however, must

529. Reading ἐκεῖνο.
530. $1091^{a}29$–$1092^{a}5$, $1092^{a}11$–17.
531. $1084^{a}12$–$^{b}2$, *Ph.* $206^{b}31$–32.

speak about the issue on the basis of the assumptions and determinations already made.

The starting-point and first of the beings is immovable both intrinsically and coincidentally, but it causes the primary eternal and single movement. But since what is moved must be moved by something, and the primary mover must be intrinsically immovable, and eternal movement must be caused by something eternal, and a single movement by a single thing, and since we see that beyond the simple spatial movement of the universe, which we say the primary and immovable substance causes, there are other spatial movements—those of the planets—that are eternal (for the body with a circular movement is eternal and unresting, as has been proved in our studies concerning nature[532]), each of these spatial movements must be caused by a substance that is both intrinsically immovable and eternal. For the nature of the stars is eternal, because it is a certain sort of substance, and the mover is eternal and prior to the moved, and what is prior to a substance must be a substance. It is evident, therefore, that there must be this number of substances that are in their nature eternal and intrinsically immovable, and without magnitude (due to the cause mentioned previously[533]).

1073b1 It is evident, then, that the movers are substances, and that one of these is first and another second in accord with the same order as the spatial movements of the stars. But when we come to the number of these spatial movements, that is actually something one must investigate on the basis of the mathematical science that is most akin to philosophy: astronomy; for it is concerning substance that is perceptible but eternal that this makes its theoretical investigation, while the others are not concerned with any substance at all—for example, the one concerned with numbers and geometry.

That the spatial movements are more numerous than the bodies that are moved is evident even to those with a moderate grasp on the subject (for each of the planets has more than one spatial movement). But as for how many these [movements] are, we now—to give some notion of it—state what some of the mathematicians say, so that there must be some definite number for our thought to grasp. But as for the rest,[534] we must speak in part having inquired ourselves, in part having learned from the inquirers, and if something contrary to what is now said appears correct to those who are busying themselves with these issues, we should welcome both, but be persuaded by the more exact ones.

Eudoxus, then, posited that the spatial movement of the sun and the moon in each case involves three spheres, of which the first is the sphere of the fixed stars, the second moves in the [circle] along the middle of the zodiac, and the third moves in the one inclined across the breadth of the zodiac (but the circle in which the moon

532. *Ph.* 8.8–9, *Cael.* 1.2, 2.3–8.
533. 1073a5–11.
534. I.e., what comes after a definite number of movements has been suggested.

moves is inclined at a greater angle than that in which the sun is spatially moving). The spatial movement of the planets involves in each case four spheres, and of these the first and the second are the same as for the sun and the moon (for the sphere of the fixed stars is what moves all the other spheres, and the one that is placed beneath this and has its spatial movement in the circle along the middle of the zodiac is common to all the spheres). But the poles of the third sphere of each planet are in the circle along the middle of the zodiac, while the spatial movement of the fourth sphere is inclined at an angle to the equator of the third one. Also, the poles of the third sphere are special to the various planets, but those of Venus and of Mercury are the same.

As for Callippus, he posited the same position of the spheres that Eudoxus posited, but while he assigned to Jupiter and Saturn the same number as Eudoxus did, he thought that two further spheres should be added to the sun and to the moon, if one is to account for the appearances, and one more to each of the other planets.[535] But if all the spheres combined are to account for the appearances, for each of the planets there must be other spheres, but one fewer, which counteract the former, and in each case restore to the same position the first [or outermost] sphere of the star that is placed beneath the star in question; for only in this way is it possible for all the combined spheres to produce the spatial movement of the planets. Since, then, the spheres in which the planets themselves are carried along are eight [for Jupiter and Saturn] and twenty-five [for the others], and of these, only those in which the lowest one is carried along does not need to be counteracted, the spheres that counteract those of the first [or outermost] two planets will be six, and those counteracting the spheres of the next four will be sixteen.[536] The number, then, of all the spheres, both moving and counteracting, will be fifty-five. And if one does not add to the moon and the sun the movements mentioned,[537] all the spheres will be forty-seven[538] in number.

535. The reason for these modifications is not entirely clear.

536. Starting with the primary or outermost heaven we have a series of concentric spheres encircling the earth. The sphere of the moon is the innermost celestial sphere, so that below it there is no other (hence "one fewer"). Suppose, then, that A (outermost), B, C, D (innermost) are the four spheres on which, according to Eudoxus and Callippus, Saturn is affixed. Inside sphere D, Aristotle is proposing to insert a first reactive sphere D*, which rotates on the poles of D and at the same speed, but in the opposite direction. The rotations of D and D* cancel each other, so that any point on D* will move as if rigidly connected to C. Inside D* in turn is placed a second reactive sphere C*, which is related to C as D* is to D, so that any point of C* will move as if rigidly connected to B. Finally, inside C* is placed B*, with the result that any point on B* will move as if rigidly connected to A. But A, as the outermost sphere of Saturn, has the movement of the fixed stars; hence B* will also have that movement. As a result the spheres of Jupiter, which are inside those of Saturn, can move inside B* as if Saturn's spheres did not exist and as if B* were the sphere of the fixed stars.

537. I.e., the four extra ones proposed by Callippus (1073ᵇ25–26) together with the two reactive spheres needed for the sun (the moon needs none), for a total of six.

538. Reading ἑπτὰ. The correct number is forty-nine = fifty-five minus six.

Let this, then, be the number of the spheres; so that to suppose that the substances and starting-points that are immovable and beyond[539] the perceptible ones are also just that many is reasonable (for that it is necessary must be left to stronger thinkers[540] to claim). But if there can be no spatial movement that does not contribute to the spatial movement of a star, and if furthermore every nature and every substance that is impassive and has intrinsically attained the best end must be regarded as an end, there can be no other nature beyond these, and this must be the number of the substances. For if there were others, they would produce movement by being an end of spatial movement. But there cannot be any other spatial movements beyond those mentioned. It is reasonable to suppose this on the basis of the bodies that are moved. For if everything that carries something along naturally does so for the sake of what is carried along, and every spatial movement is the movement of something that is spatially moved, no spatial movement can be for the sake of itself or of another spatial movement, but all the movements must be for the sake of the stars. For if there is to be a spatial movement for the sake of a spatial movement, this latter will also have to be for the sake of something else. And so, since this cannot go without limit, the end of every spatial movement will be one of the divine bodies that are spatially moved throughout the heaven.

And that there is but one heaven is evident. For if there are many, as there are many humans, the starting-point for each will be one in form but in number many. But all things that are many in number have matter (for one and the same account applies to many, for example, humans, while Socrates is one). But the primary essence does not have matter; for it is an actuality. Therefore, the primary immovable mover is one both in account and in number—and so, therefore, is what is moved always and continuously, one alone. Therefore, there is one single heaven.

There is a tradition handed down from the ancients of the earliest times and bequeathed to posterity in the shape of a myth to the effect that these[541] are gods and that the divine encompasses the whole of nature. The rest of the tradition has been added later in a mythical way with a view to the persuasion of ordinary people and with a view to its use for legal purposes and for what is advantageous; for they say that these gods are human in form or like some of the other animals, and also other features that follow from or are much the same as those just mentioned. But if one separates the first point from these additions and grasps it alone, that they thought that the primary substances were gods, one would have to regard it as divinely said, and that while it is likely that each craft and each philosophy has often been developed as far as possible only to pass away again,[542] these beliefs about the gods have survived like remnants until the present. The belief of our forefathers, then, and of our earliest predecessors is to this extent alone illuminating to us.

12.9
Divine Understanding and the Primary God

Issues concerning the [divine] understanding involve certain puzzles; for while it seems to be the most divine of the appearances,[543] the question of how it can have that character involves certain difficulties. For if, on the one hand, it understands nothing, where is its dignity? It would be just like someone asleep. And if it does understand something, but another thing controls it (for what it is, its substance, is not active understanding, but a capacity), it would not be the best substance; for it is because of actively understanding that esteem belongs to it.

Further, whether it is understanding [as a capacity] or active understanding that is the substance of it, what does it understand? For it is either itself or something else. And if something else, either always the same thing or sometimes this and sometimes that. Does it, then, make a difference or none at all whether it actively understands the noble or some random object? Surely, it would be absurd for it to think of certain things. It is clear, therefore, that it actively understands what is most divine and most estimable and does not change [its object]; for change would be for the worse, and would already be a sort of movement.

First, then, if its substance is not active understanding, but rather a capacity [to understand], it is reasonable to suppose that the continuity of its active understanding is laborious for it.[544] Next, it is clear that something else would be more estimable than the understanding, namely, what is understood. For both [the capacity] to understand and active understanding will belong even to someone who actively understands the worst thing, so that if this is to be avoided (for there are in fact some things that it is better not to see than to see), the active understanding would not be the best thing. It is itself, therefore, that it understands, if indeed it is the most excellent thing, and the active understanding is active understanding of active understanding.

It appears that scientific knowledge, perception, belief, and thinking are always of something else, and of themselves only as a by-product. Further, if to understand and to be understood are distinct, in virtue of which of them does the good belong to it? For the being for an active understanding is not the same as the being for a thing understood. The answer is that in some cases the scientific knowledge is the thing. In the case of the productive sciences isn't it the substance and the essence **1075^{a}1** without the matter? In the case of the theoretical sciences isn't it the account, the thing, and its active understanding? In the cases, then, where the thing understood and the understanding of it are not distinct, in those where the thing understood has

543. 1074^{a}1, *Ph.* 196^{a}33–34.
544. 1050^{b}22–28.

no matter, they will be the same, and the active understanding will be one with the thing understood.[545]

A further puzzle remains as to whether the thing understood is composite; for if it were, the [divine] understanding would undergo change in understanding the parts of the whole. The answer is that everything that has no matter is indivisible, just as the human understanding [of such things] is, or the understanding even of composite things in a certain time (for it does not possess the good in [understanding] this or that [part], rather, in [understanding] a certain whole, it possesses the best, being something else), and this is the condition of this active understanding which, for all eternity, is an active understanding of itself.

12.10
The Primary God and the Nature of the Whole

One must also investigate in which of the two ways the nature of the whole possesses the good and the best—whether as something separated and intrinsic, or as its organization. The answer is in both ways, like an army. For the good of an army is in its organization, and is also the general—and more so the latter; for he is not because of the organization, but it is because of him. All things are jointly organized in a way, although not in the same way—even swimming creatures, flying creatures, and plants. And the organization is not such that one thing has no relation to another, but rather there is a relation. For all things are jointly organized in relation to one thing—but it is as in a household, where the free people least of all do things at random, but all or most of the things they do are organized, while the slaves and beasts can do a little for the common thing, but mostly do things at random; for this is the sort of starting-point that the nature is of each of them. I mean, for example, that all must come to be disaggregated,[546] at any rate; and similarly there are other things which they all share for [the good of] the whole.

However, one should not overlook the impossibilities and absurdities that follow for those who say otherwise, and what sorts of things are said by those who speak in a more sophisticated way, and what sorts involve the fewest puzzles. For all of them make all things from contraries. But neither all things nor from contraries is correct, nor do they say how those things in which contraries are present will be made from them; for contraries are impassive with respect to each other.[547] For us this issue is resolved in a reasonable way, by there being a third thing.[548] But others make one of the two contraries matter, as, for example, do those who

545. 1072[b]19–21.
546. I.e., into their elements.
547. *Ph.* 189[a]21–26.
548. I.e., the matter.

make the unequal matter for the equal or the many for the one.[549] And this too is resolved in the same way; for the matter, which is one, is not the contrary of anything.[550] Further, all things, outside the one, will participate in the bad; for the bad is itself one of the elements. (Others do not even regard the good and the bad as starting-points. And yet in all things the good is most of all a starting-point.) They are, however, correct about this, that the good is a starting-point. But in what way the good is a starting-point they do not say—whether as end, or as mover, or as form.

1075^{b}1

Empedocles also speaks absurdly; for he makes love be the good,[551] and this a starting-point both as mover (for it brings together) and as matter; for it is a part of the mixture. But even if the same thing is coincidentally a starting-point both as matter and as mover, nonetheless their being is not the same. To which, then, does love correspond? It is absurd too for strife to be incapable of passing away; for strife for him is the nature of the bad.[552]

Anaxagoras makes the good his starting-point as mover; for the understanding moves things.[553] But it moves them for the sake of something, so that this is a distinct thing, except in our way of describing it; for the craft of medicine is in a way health. It is absurd too not to posit a contrary to the good and to the understanding. But all those who speak of contraries fail to use contraries, unless one reformulates what they say.

Also, why some things are capable of passing away while others are incapable of passing away, no one says; for they produce all the beings from the same starting-points. Further, some produce the beings from what is not, while others, in order to avoid having to do this, make all things one.

Further, why there will always be coming to be, and what the cause of coming to be is, no one says. And for those who posit two starting-points there must be another starting-point with more control. And for those who posit the Forms there will be yet another starting-point with more control; for why did things come to participate, or why do they participate, [in the Forms]?

Also, for the others there must be some contrary to theoretical wisdom and the most estimable science, but not for us. For nothing is contrary to the primary thing; for all contrary things have matter, and such things are potential. The contrary state, ignorance, leads to the contrary, but to the primary thing nothing is contrary.

Further, if beyond the perceptibles there are not going to be any other things at all, there will not be a starting-point, order, coming to be, or celestial movements,

549. I.e., Platonists (988^{a}7–14).
550. Reading ἡ μία οὐδενὶ ἐναντίον.
551. 985^{a}21–29.
552. 1051^{a}15–21.
553. 984^{b}8–22, 985^{a}18–21.

but always a starting-point of the starting-point, as there is for the theologians[554] and all of the natural scientists.

But if the Forms or the numbers are going to be the starting-points, they will be cause of nothing—or, if not that, at least not of movement. Further, how will what is a magnitude and continuous come from what lacks magnitude? For number will not produce something continuous, either as mover or as form.

But again there will not be one of the contrary things that will be precisely what is both capable of acting [on things] and capable of moving [things]; for it would admit of not being. But again acting [on things] is posterior to capacity. Therefore, the beings will not be eternal. But they are. Therefore, one of these must be done away with. And it has been said[555] in what way.

Further, about what makes numbers one, or soul and body, or, in general, form and thing, no one says anything. Nor is it possible, unless one says it as we do,[556] to say in what way the mover makes them one. And those who say that mathematical number is primary,[557] and that in the same way there is again and again some other contiguous substance and a starting-point of each, make the substance of the universe episodic (for one substance contributes nothing to another by being or not being) and posit many starting-points. The beings, however, do not wish to be badly governed: "To have many rulers is not good; let there be one ruler."[558]

BOOK 13 (MU)

13.1
Mathematical Objects and Platonic Forms as Substances and Causes

As regards the substance of perceptibles, it has been said what it is, dealing with matter in the methodical inquiry into natural things, and later with substance as activity.[559] But since the investigation is into whether or not beyond the perceptible substances there is any that is immovable and eternal, and, if there is, what it is, it is first necessary to get a theoretical grasp on what is said by others, so that, if there is anything they say incorrectly, we may not be liable to the same objections, while if there is any belief common to us and them, we may not on that account have any

private misgivings against ourselves; for one must be content if one states some things better and others no worse.

There are two beliefs on this subject. Some people say that the objects of mathematics—for example, numbers, lines, and things of that kind—are substances, and in addition that the Forms are. And since some make these two distinct kinds of things—the Forms and the mathematical numbers—and some posit a single nature for both, while some others say that only the mathematical substances are substances,[560] the objects of mathematics must be investigated first, without positing any other nature for them—not asking, for example, whether they are in fact Forms or not, or whether they are starting-points and substances of the beings or not, but only whether, considered as objects of mathematics, they exist or not, and if they exist, in what way they do. Then after this one must separately investigate the Forms themselves but in general terms and to keep with the usual way of doing things; for most of the points have been made also in the external accounts. Further, the greater part of the account must relate to this question, when we will investigate whether substances and the starting-points of the beings are numbers and Forms; for after the Forms this remains as a third investigation.[561]

If indeed the objects of mathematics exist, however, they must exist either in perceptibles, as some say, or separate from perceptibles (there are also some who say this), or, if they exist in neither way, either they do not exist or they exist in some other way. So our dispute will not be about whether they exist but about the way they do.

13.2
The Ways Objects of Mathematics Do Not Exist

That it is impossible for the objects of mathematics to exist in perceptibles, and at the same time that the argument for it is fabricated, has also been stated in going through the puzzles,[562] where it was pointed out that it is impossible for two solids to be in the same place at the same time, and further that by the same argument the other capacities and natures would also be in the perceptibles and none would exist separately. **1076^{b}1**

This has been said already, but in addition it is evident that it is impossible on this view for any body whatever to be divided; for it would have to be divided at a plane, and the plane at a line, and the line at a point, so that if the point cannot be divided, neither can the line, and if the line cannot, neither can the others. What difference, then, does it make whether these [perceptible points and lines] are natures of this indivisible sort, or, without being such themselves, have such natures in them? For the result

560. 1069^{a}34–36.
561. 13.6–9.
562. Part of P4 998^{a}7–19.

will be the same; for if the perceptibles are divided, the others will be divided too, or else the perceptibles will not be divided either.

But then again it is not possible for such natures to exist separately. For if there are to be solids beyond the perceptible ones, separate from them, and prior to the perceptible ones, it is clear that beyond the planes there will necessarily also be distinct and separate planes, as well as points and lines (for the same argument applies). But if this is so, beyond the planes, lines, and points of the mathematical solid there will again be others that are separate (for incomposites are prior to composites, and if indeed there are non-perceptible bodies prior to the perceptible ones, by the same argument there are also planes that are intrinsic beings and are prior to those in the immovable solids[563]), so that these lines and solids are distinct from those that exist together with the separate solids; for the latter exist together with the mathematical solids, while the former are prior to the mathematical solids. Again, therefore, there will be lines belonging to these planes, and prior to them there will need to be distinct lines and points, because of the same argument. And prior to the points in the prior lines there will be distinct prior points, though there will be no others prior to these.

The accumulation, then, becomes absurd. For we get one lot of solids beyond the perceptible ones; three lots of planes beyond the perceptible ones—those beyond the perceptible ones, those in the mathematical solids, and those beyond the ones in those solids; and four lots of lines, and five lots of points.[564] So with which of these will the mathematical sciences be concerned? Certainly not with the planes, lines, and points in the immovable solids; for a science is always concerned with what is prior.

And the same argument also applies to numbers; for beyond each lot of points there will be distinct units, and indeed beyond each lot of beings (beyond the perceptible ones, and again beyond intelligible ones), so that there will be unlimited kinds of mathematical numbers.

Further, how is it possible to resolve the precise issues also gone over in the discussion of puzzles?[565] For the objects of astronomy will be beyond the perceptibles in the same way as the objects geometry is about. But how is it possible for there to be a heaven and its parts [beyond the perceptible one], or anything else with movement? It is the same way with the objects of optics and of harmonics; for there will be both voice-able sound and seeable thing beyond the perceptible and particular ones. So it is clear that the same also holds of the other sorts of perception and the other

563. I.e., the mathematical ones.

564. The four lots of lines are (1) the one in the perceptible plane that is part of the perceptible solid; (2) the one in the mathematical plane that is part of the mathematical solid; (3) the one in the mathematical plane that is not part of but prior to the mathematical solid; and (4) the one that is not part of but prior to the mathematical plane that is not part of but prior to the mathematical solid. There are five lots of points for cognate reasons.

565. Part of P4 997ᵇ12–34.

perceptibles; for why of this one more than that one? But if that is the case, there will also be animals [beyond the perceptible ones], if indeed there are sorts of perception.

Further, there are certain propositions stated by the mathematicians that are universal and go beyond these substances. Here too, then, there will be another intermediate substance separate both from the Forms and from the intermediates, that is neither number nor point nor magnitude nor time. And if this is impossible, it is clear that it is also impossible for the others to exist separate from the perceptibles.

And, in general, conclusions follow that contradict both the truth and the things it is usual to suppose are the case, if one posits that the objects of mathematics exist in this way, as certain natures that are separate. For because they exist in this way they must be prior to perceptible magnitudes, but in fact they are posterior; for incomplete magnitude, while prior in coming to be, is posterior in substance, as the inanimate is to the animate.[566]

Further, in virtue of what precisely[567] will a mathematical magnitude be one? For the things that exist here are one in virtue of soul or a part of soul or something else that is reasonable.[568] But if a thing is not like that, it is many and is split into parts. But a mathematical magnitude is divisible and quantitative, so what is the cause of its being one and holding together?

Further, their comings to be make the difficulty clear. For first length comes to be, then breadth, finally depth, and then it is complete. If, then, what is posterior in coming to be is prior in substance, the body will be prior to the plane and the line. And in this way too it is more complete and more of a whole, because it becomes animate. But how could a line or a plane be animate? Indeed, the proposition would go beyond [the reach of] our perceptions.[569]

Further, a body is a sort of substance (for it already has completeness in a way). But how can lines be substances? Neither as a form or shape, like the soul (if indeed it is something of this sort), nor as matter is, like the body; for nothing is seen that is capable of being composed of lines or planes or points, though if these were some sort of material substance, things would have been seen that are capable of this.

Grant, then, that they are prior in account. Still not everything that is prior in account is prior in substance too. For those things are prior in substance to others which, when separated, surpass them in being, while things are prior in account to those things whose accounts are composed of their accounts. And these do not [necessarily] apply together. For if affections are not beyond the substances (for example, moving or pale), the pale is prior to the pale human in account but not in substance; for it does not admit of being separated, but is always together with the compound (and by "the compound" I mean the human who is pale), so that it is evident that

566. 1077^{a}24–^{b}11.
567. Reading τίνι ποτ'.
568. Reading ἢ ἄλλῳ τινὶ εὐλόγῳ.
569. 1077^{a}36.

neither is what results from abstraction prior nor is what results from an addition posterior; for it is from an addition to the pale that the pale human is said of things.

It has been adequately stated, then, that the objects of mathematics are not substances more than bodies are, that they are not prior to perceptibles in being but only in account, and that it is not possible for them to be in any way separated. But since it was not possible for them to exist in perceptibles either, it is evident that either they do not exist at all, or they do so in a certain way, and because of this they do not exist unconditionally; for things *are* in many ways, we say.

13.3
The Way Objects of Mathematics Do Exist

For just as the universal propositions of mathematics are not about separate objects that exist beyond the magnitudes and the numbers, but are about magnitudes and numbers, although not insofar as they are such as to have magnitudes or to be divisible, it is clearly possible that there should also be statements and demonstrations concerning perceptible magnitudes, although not insofar as they are perceptible but insofar as they are of such-and-such a sort. For just as there are many statements about things only insofar as they are moving, separate from what each of them is and from their coincidents, and since it is not necessary because of this for there to be either a movable thing separate from the perceptible ones or some such nature distinguishable in them, so too in the case of movable things there will be statements and sciences concerning them, not insofar as they are movable, but only insofar as they are bodies, or again only insofar as they are planes, or only insofar as they are magnitudes, or only insofar as they are divisible, or are indivisibles having position, or are indivisibles.

So, since it is true to say unconditionally not only that separable things exist but also that inseparable ones do (for example, that movable things exist), it is also true to say unconditionally that the objects of mathematics exist, and that they are such as they are said to be. And just as it is also true to say unconditionally of the other sciences that they are of this or that, not of what is coincidental to it (for example, not of pale, if the healthy thing is pale and the science is of being healthy) but of the thing that each is of (of being healthy if [it is concerned with someone] insofar as he is healthy, of human if insofar as he is human), so it is too with geometry. If the things it is of are coincidentally perceptible, but it is not of them insofar as they are perceptible, the mathematical sciences will not[570] be of perceptibles—nor, however, will they be of other things separate from perceptibles.

Many coincidents belong intrinsically to things insofar as they are, each of them, of a certain sort—for example, insofar as the animal is female and also insofar as it

570. Reading οὐ.

is male, there are affections special to it (and yet there is no male or female separate from the animals). So there are also such affections of things only insofar as they are lengths or insofar as they are planes. And to the extent, therefore, that [a science] is concerned with what is prior in account and simpler, to that extent the more exactness it has (and this is what simplicity does). So there is more exactness without magnitude, certainly, than with magnitude, and most without movement, but if there is movement, there is most with the primary movement; for this is the simplest, and of this the one that is uniform.

The same account also applies to harmonics and optics; for neither gets a theoretical grasp on a thing insofar as it is a voice-able sound or a seeable thing but insofar as it is lines and numbers (these being affections that properly belong to the former things). And mechanics is the same way.

So if one posits things as separated from their coincidents and investigates them as such, one will not falsify anything because of this, any more than when one draws a line on the ground and calls it "a foot long" when it is not a foot long; for the falsification is not included among the premises.

The best way of getting a theoretical grasp on a given thing would be this: if one posits as separate what is not separate, in precisely the way the arithmetician and the geometer do. For the human insofar as he is human is one and indivisible. And the arithmetician assumes him to be one and indivisible, and then gets a theoretical grasp on what is coincident with a human insofar as he is indivisible, while the geometer gets such a grasp on him neither insofar as he is human nor insofar as he is indivisible but insofar as he is a solid. For it is clear that the affections that would belong to him even if he were somehow not indivisible can still belong to him without these. So, because of this, the geometers speak correctly, and it is about beings that they speak, and these are beings; for being is twofold: on the one hand, actual, on the other, in the material way.[571]

Since the good and the noble are distinct, however (for the good is always found in action, while the noble is found also in immovable things), those who assert that the mathematical sciences say nothing about the noble or the good are speaking falsely. For these sciences say and prove these, and in the highest degree; for if they do not name them, but prove their works and their accounts, it does not follow that they are not saying anything about them. For the chief forms of the noble are order, proportion, and definiteness, which are what the mathematical sciences prove in the highest degree. And since, at any rate, these (I mean, for example, order and definiteness) are manifestly causes of many things, it is clear that they would say that this sort of cause—the noble—is also a cause in a certain way. But we will speak more explicitly about this elsewhere.[572]

571. I.e., potentially (1042^{a}27–28).
572. No such discussion is extant.

13.4
The Socratic Origins of the Theory of Forms; 1.6–9 Partly Recapitulated

About the objects of mathematics, then, that they are beings and in what way they are beings and in what way they are prior and in what way not prior, let this much be said. As regards the Forms, one must first investigate the notion of a Form, not connecting it in any way with the nature of the numbers, but in the way those who first said that there are Forms took it to be at the start.

The belief in Forms occurred to the people who stated it because as regards the truth they were persuaded by the Heraclitean arguments that all perceptible things are always flowing, so that if indeed there is to be scientific knowledge of anything and wisdom, there must be some other natures, beyond the perceptible ones, that are permanent; for there is no scientific knowledge of the flowing ones.

Socrates, though, busied himself about the virtues of character, and in connection with these was the first to inquire about universal definition (for among the natural scientists Democritus latched onto this only a little, and defined, after a fashion, the hot and the cold, while the Pythagoreans had previously done this for a few things, whose accounts they connected to numbers—for example, what opportune is, or the just, or marriage). It was reasonable that Socrates was inquiring about the what-it-is;[573] for he was inquiring in order to deduce, and the what-it-is is a starting-point of deductions; for at that time there was not yet the strength in dialectic that enables people, even separately from the what-it-is, to investigate contraries, and whether the same science is a science of contraries;[574] for there are two things that may be fairly ascribed to Socrates, inductive arguments and universal definition, both of which are concerned with a starting-point of scientific knowledge. However, while Socrates did not make the universals separable nor the definitions, the others did separate them, and these were the sorts of beings they called "Forms," so that it followed for them, pretty much by the same argument, that there are Forms of all things that are spoken of universally.

And so the result was[575] much the same as if a person who wished to count the beings were to think that he would not be able to do it while there were so few of them, but, having made more, would then count them; for the Forms are (one might almost say) more numerous than the perceptible particulars, yet it was in inquiring about the causes of these that they proceeded from them to the Forms; for in each case there is something that has the same name[576] and is beyond the substances, and also in the case of the others there is a one over many, both over those that exist

573. *EE* 1216b2–16.
574. 996a18–21 (part of P1).
575. 1078b34–1079b3 = 990b2–991b8.
576. Reading ὁμώνυμόν τι (990b5–6).

here and over the eternal ones. Further, of the ways in which it is proved that there are Forms, none makes these evident; for from some no deduction is necessarily generated, while from some others Forms are also generated of things of which they think there are no Forms. For, in accord with the arguments from the sciences, there will be Forms of all things of which there are sciences, and in accord with the one over many there will be Forms even of negations, while in accord with the argument that there is understanding of a thing that has passed away there will be Forms of things that pass away; for there is an appearance of them. Further, of the most exact of the arguments, some produce Forms of relatives, of which they say there is not an intrinsic kind, while others introduce the third man.

And, in general, the arguments for the Forms do away with the things that those accepting Forms prefer to the existence of the Forms; for it follows that it is not the dyad that is primary but number, that prior to number is the relative, and that this is prior to the intrinsic, and all the other things that certain people, by following out the beliefs held about the Forms, have accepted contrary to the starting-points.

Further, by the supposition according to which they say that there are Forms, Forms will exist not only of substances but also of many other things (for the intelligible object is a one not only in the case of substances, but also in the case of non-substances, and there are sciences not only of substance), and countless other such difficulties arise. But according to the necessities of the case and to the beliefs held about them, if the Forms are to be participated in, there must be Forms of substances only; for they are not participated in coincidentally, but rather a thing must participate in each in this way, insofar as it is not said of an underlying subject (I mean, for example, if something participates in double-itself, it also participates in the eternal, but does so coincidentally; for it is coincidental to the double that it is eternal), so that the Forms will be substance. But it is the same things that signify substance here as over there—or what will it mean to say that there is something beyond these things here, the one over the many? And if the Forms and the things that participate in them have the same form, there will be something common to them (for why should the two be one and the same[577] in the case of the twos that pass away, and in the many eternal twos, rather than in the case of two-itself and some particular two?); but if they do not have the same Form, they would be homonymous, just as if someone were to call Callias and a wooden statue a "man," seeing no commonality between them.

But if we are to posit that in other respects the common accounts apply to the Forms—for example, that plane figure and the rest of the parts of the account apply to the circle-itself, but the what-it-is must be added, we should investigate whether this is not entirely empty.[578] For to what is this to be added? To center, to plane, or to all the parts? For all the things in the substance are Forms—for example, human and

577. Reading τὸ δυὰς ἓν καὶ ταὐτόν.
578. 997^{b}5–12.

two-footed. Further, so-and-so-itself must, just like the plane, be some sort of nature that will be present in all the Forms as their kind.

13.5
What the Forms Contribute to Perceptibles: 1.9 Partly Recapitulated

Above all, one might go through the puzzles of what precisely the Forms contribute to perceptibles, either to those that are eternal or to those that come to be and pass away. For they are not the causes of movement or of any change whatever in them. But then they are also of no help at all either as regards the scientific knowledge of the other things (for they are not their substance; for otherwise they would be in them), or in regard to their being, if they are not present in the things that participate in them; for if they were, they might perhaps seem to be causes in the way that what is white is a cause when mixed with a white thing. But this account is all too readily upset—it is one that first Anaxagoras and later Eudoxus stated (in going through the puzzles), and also certain others (for it is easy to collect many impossibilities against a belief of this sort).

But then neither is it possible to say, in any of the familiar ways of speaking, that the other things come from the Forms. To say that the Forms are paradigms and that the other things participate in them is to utter empty words and poetic metaphors. For what is it that, looking to the Forms, is doing the work? It is possible for anything both to be and come to be without being copied from something, so that whether Socrates exists or not, someone could become like Socrates. And the same would clearly hold even if Socrates were eternal. Also, there will be more than one paradigm for the same thing, and so more than one Form—for example, the Forms of the man will be the animal and two-footed, as at the same time will be man-itself. Further, the Forms will be paradigms not only for the perceptibles but also for themselves—for example, the kind, as kind of the several forms. So the same thing will be paradigm and copy.

Further, it would seem to be impossible for the substance and that of which it is the substance to be separate. So how could the Forms, being the substances of things, be separate from them?

In the *Phaedo*, however, it is said in this way: the Forms are causes both of the being and of the coming to be of things. And yet if the Forms exist, things would still not come to be unless there was a mover. Also, many other things come to be—for example, a house or a ring—of which they say there are no Forms. So it is clear that it is also possible for the things of which they say there are Forms both to be and to come to be through the same causes as the things mentioned just now, but not because of the Forms. But in the case of the Forms it is possible, both in this way and by more logico-linguistic and more exact arguments,[579] to collect many objections like those considered.

13.6
Numbers as Separable Substances: Pythagoreans and Platonists

Since these issues have been determined, it is well to get a theoretical grasp again on the consequences in the case of numbers for those who say that they are separable substances and primary causes of the beings.

If number is indeed a sort of nature and its substance is nothing other than just number, as some people say, one of two things necessarily follows. Either there is a first in it and a successor, each being distinct in form, and this applies directly to the units, and any unit is non-combinable with any other unit. Or units are all directly successive and any combinable with any, as they say is the case with mathematical number (for in mathematical number no unit differs in any way from any other). Or some units are combinable and some are not. Suppose, for example, that two is first after one, and then three, and in this way, then, the rest of the numbers, and the units in each number are combinable (for example, those in the first two numbers are combinable with each other, and those in the first three numbers with each other, and likewise in the case of the other numbers), while the units in the two-itself are non-combinable with those in the three-itself, and likewise with the other successive numbers. That is why mathematical number is counted, after one, two (which includes another one), and then three (which includes another one in addition to those two), and the rest likewise, while this second sort of number is counted, after one, a distinct two (which does not include the first one), and a distinct three (which does not include two), and similarly with the other numbers. Or one sort of number is like the first mentioned, another is like the sort the mathematicians speak about, and a third like the sort mentioned last.

Further, these sorts of numbers must either be separable from things or not separable but in perceptibles (not, however, in the way we first investigated,[580] but in such a way that the perceptibles are composed of numbers that are present in them), or some are and some not, or all are. **1080^{b}1**

These, then, are of necessity the only ways in which numbers can exist. And of those who say that the one is starting-point, substance, and element of all things, and that number is composed of it and something else, pretty much everyone has described them in one of these ways (except that no one has said that all units are non-combinable). And this has occurred reasonably; for no further way is possible beyond those mentioned.

Some say, then, that both sorts of numbers exist, the sort with a before and after being Forms, and mathematical number being beyond the Forms and the perceptibles, and both being separable from the perceptibles. But others[581] say that only mathematical number exists, and is the first of the beings, separate from the

580. 1076^{a}38–^{b}11.
581. Speusippus (1028^{b}21–24).

perceptibles. And the Pythagoreans too say that there is one sort, the mathematical, except they say that it is not separate, but rather perceptible substances are composed of it; for they construct the whole heaven from numbers, except not numbers composed of units; rather, they suppose the units to have magnitude. But how the first one was composed so as to have magnitude they seem at a loss to say.

Another thinker[582] says that the first sort of number, Form number, alone exists, and some say that mathematical number is the same as this.

It is the same way as regards lines, planes, and solids. For some people[583] think that those that are the objects of mathematics and those that come after the Forms are distinct. But of those who say otherwise some speak of the mathematical numbers in a mathematical way (those who do not make the Forms numbers or say that the Forms exist[584]), while others[585] speak of the mathematical numbers but not in a mathematical way; for they say that not every spatial magnitude is divisible into magnitudes, and that not just any two units make two. All those who say that the one is an element and starting-point of the beings assume numbers to be composed of units, except the Pythagoreans, who say they have magnitude, as was said previously.[586]

In how many ways it is possible to speak of numbers, then, and that all the ways have been mentioned, is evident from these considerations. They are all impossible, but some perhaps more than others.

13.7
Plato on Units

First, then, whether the units are combinable or non-combinable must be investi-
1081ᵃ1 gated, and if non-combinable, in which of the ways we distinguished.[587] For it is possible for any unit to be non-combinable with any unit, and it is also possible for those in the two-itself to be non-combinable with those in the three-itself, and in this way, then, for those in each of the first [or Form] numbers to be non-combinable with each other.

If all units are combinable and without difference, it is mathematical number that results, and this one only, and the Forms cannot be the numbers. (For what sort of number will man-itself or animal-itself or any other Form be? For there is one Form of each thing—for example, one of man-itself and another of animal-itself. But the similar and undifferentiated numbers are unlimitedly many, so that this three is no

587. 1080ᵃ18–20, 23–35.

more man-itself than any other three.) But if the Forms are not numbers, they cannot exist at all either. (For from what starting-points will the Forms come? For number comes from the one and the indefinite dyad, and the starting-points[588] and elements are said to be starting-points and elements of number, and so the Forms cannot be ranked as either prior or posterior to the numbers.)

But if units are non-combinable, so that none is combinable with any other, this sort of number cannot be mathematical number (for mathematical number is composed of undifferentiated units, and the things proved about it fit it as such). But it cannot be Form number either. For the two will not be the first thing to come from the one and the indefinite dyad, followed by the successive numbers, in the way that two, three, four . . . are said—for the units in the first two are generated at the same time, whether, as the first person [to introduce Forms] said, when the unequals have been equalized,[589] or in some other way. Besides, if[590] one unit is to be prior to the other, it will also be prior to the two composed of these; for whenever one thing is prior and another posterior, a thing composed of both of them will be prior to the latter and posterior to the former.

Further, since the one-itself is first, and then there is a one that is first among the others but second after it, and again a third, second after the second one and third after the first one, so that the units would be prior to the numbers after which they are named—for example, there will be a third unit in two before three exists,[591] and a fourth in three, and a fifth, before these numbers exist.

None of these thinkers has said that the units are non-combinable in this way, but in accord with their starting-points even this way of doing it is reasonable, although in accord with the truth it is impossible. For it is reasonable for units both to be prior or posterior if indeed there is a first unit and a first one, and similarly with twos, if indeed there is a first two; for after the first it is reasonable, indeed necessary, for there to be a second, and if a second, a third, and so on with the others in succession. (But to say both things at the same time, that a unit is first and another unit is second after the one, and also that two is first after it, is impossible.) But these thinkers make a first unit, and a first one, but not after that a second and a third, and a first two, but not after that a second and a third.

It is evident too that it is not possible if all units are non-combinable for there to be a two-itself and a three-itself, and so on with the other numbers. For whether units are undifferentiated or different from each other, number must be counted by addition—for example, two by adding another one to the one, three by adding another one to the two, and four similarly. But if this is so, numbers cannot come to be in the way

588. Reading καὶ αἱ ἀρχαὶ.
589. 1083^{b}23–25, 1091^{a}24–25.
590. Reading ἔπειτα εἰ.
591. The number 1 maps onto unit 1: $N_1 \rightarrow U_1$. The number 2 onto two new units: $N_2 \rightarrow U_2+U_3$. At that point we already have three units (U_1, U_2, U_3), but the number 3 has yet to be constructed.

these thinkers generate them from the dyad and the one. For two becomes part of three and three of four, and the same happens in the case of the succeeding numbers. But [on their view] four comes from the first two and the indefinite dyad—two twos beyond the two-itself. Otherwise two-itself will be part of four, and one other two will be added. And two will also come from the one-itself and another one. But if so, the other element cannot be the indefinite dyad; for it generates one unit, not a definite two. Further, beyond the three-itself and the two-itself how can there be other threes and twos? And in what way are they composed of prior and posterior units? In fact all this is absurd and fabricated, and it is impossible for there to be a first two and then a three-itself. Yet there must be, if indeed the one and the indefinite dyad are to be elements. But if the consequences are impossible, it is also impossible for these to be the starting-points.

If, then, any unit is differentiated from any other, these and other similar things necessarily follow. If, however, the units in different numbers are differentiated, and only those in the same number are undifferentiated from each other, even so the difficulties that follow are no less.

1082a1 For example, in the ten-itself there are ten units, and the ten is composed both of them and of two fives. But since the ten-itself is not some random number or composed of any random fives (or of any random units either), the units in this ten must differ. For if they do not differ, neither will the fives of which the ten is composed. But since these differ, the units will also differ. But if they differ, will there be no other fives present in the ten but only these two, or will there be others? If there are not, it is absurd. But if there are, what sort of ten will be composed of them? For there is no other ten present in the ten apart from itself. But then it is in fact necessary [on their view] that the four not be composed of any random twos; for the indefinite dyad, they say, by taking on the definite two produced two twos; for it was a two-maker of what it took on.

Further, how is it possible for the two to be a sort of nature beyond the two units, or the three beyond the three units? For either it is by one thing's participating in the other,[592] as there is a pale human beyond pale and human (for it participates in them), or else when one is some difference in the other, as the human is beyond animal and two-footed.

Further, some things are one by contact, some by mixture, some by position, but none of these can belong to the units of which two or three is composed. But rather, just as two men are not some one thing beyond both of them, so the same must also hold of the units. And their being indivisible will make no difference; for while points too are indivisible, nonetheless a pair of points is not another thing beyond the two of them.

Neither should one overlook this, that it follows that there are prior and posterior twos, and similarly with the other numbers. For grant that the twos in the four are

592. Reading θατέρου θατέρου.

simultaneous with each other. Yet these are prior to those in the eight, and just as the two generated them, they generated the fours in the eight-itself. So if the first two is a Form,[593] these twos will themselves be Forms of some sort. And the same account also applies to the units; for the units in the first two generate the four units in the four. So all the units become Forms and a Form will be composed of Forms. So it is clear that the things of which these are in fact the Forms will also be composite—so, for example, one might say that the animals are composed of animals, if there are Forms of them.

In general, to differentiate the units in any way is absurd and fabricated (and by "fabricated" I mean forced to fit with a hypothesis); for neither in quantity nor in quality do we see unit differing from unit, and number must be either equal or unequal (all number but especially the sort composed of units), so that if one number is neither greater nor less than another, it is equal to it. But things that are equal and wholly undifferentiated are supposed to be the same in the case of numbers. Otherwise, not even the twos in the ten-itself will be undifferentiated, though they are equal; for what cause will someone have for saying that they are undifferentiated? **$1082^{b}1$**

Further, if every unit plus another unit makes two, a unit from the two-itself and a unit from the three-itself will make a two, which will thus be composed of differentiated units, and so will it be prior to the three or posterior? It seems, rather, that it must be prior; for one of the units is simultaneous with the three and the other is simultaneous with the two. And we, for our part, suppose it that one plus one, whether the things are equal or unequal, is two—for example, the good plus the bad or human plus horse. But for those who say the things under consideration this does not hold even of units.

If the three-itself is not a larger number than the two, it is a wonder, but if it is larger, it is clear that there is a number in it equal to the two, so that it is undifferentiated from the two-itself. But this is not possible, if there is a first and a second number.

And the Forms will not be numbers either. For on this particular point those people are correct who say that the units must be different if indeed there are to be Forms, as was said previously;[594] for the Form is one, while if the units are not different, the twos and threes will also be undifferentiated.

That is also why it is necessary for them to say that when we count this way—one, two, . . .—we do not proceed by adding to the number that already exists (for the generation will not in that case be from the indefinite dyad, nor can a number be a Form; for then one Form will be present in another and all the Forms will be parts of one Form). And so with a view to their hypothesis they speak correctly but, taken as a whole, incorrectly; for they do away with too many things—although they will say that this question itself involves a puzzle, whether, when we count and say "one,

593. Reading ἰδέα.
594. $1081^{a}5$–17.

two, three," we count by addition or by separate parts.[595] But in fact we do it in both ways; that is why it is ridiculous that this difficulty should lead to so great a difference of substance.

13.8
Speusippus, Xenocrates, the Pythagoreans: Numbers as Separable Intrinsic Beings (1)

1083a1 First of all it is well to determine what the difference is in a number, and in a unit, if there is one. Units must differ either in quantity or in quality, but neither of these seems to admit of belonging[596] to units. But number insofar as it is number differs in quantity. If, then, the units too did differ in quantity, number would differ from number even when equal in quantity of units. Further, are the units greater or smaller, and do the later ones increase, or the contrary? All these are unreasonable. But they cannot differ in quality either. For no affection can belong to them; for to numbers too, they say, quality belongs posterior to quantity. Further, quality could not come to them either from the one or from the dyad; for the former is no quality, and the latter is quantity-producing; for this nature is what causes the beings to be many. Therefore, if units differ in some other way, they must state this at the start especially, and determine the difference in a unit, and especially why it must belong [to units]. Otherwise what difference are they talking about?

It is evident, then, that if indeed the Forms are numbers, the units cannot all be combinable, nor can they be non-combinable with each other in either of the two ways.[597]

But the way that some other people[598] speak about numbers is not correct either. These are the people who think that Forms do not exist, whether unconditionally or as being certain numbers, but that the objects of mathematics do exist, that the numbers are primary among the beings, and that the starting-point of them is the one-itself. For it is absurd for there to be, as they say, a one that is primary among the ones, but not a two among the twos, or a three among the threes; for the same argument applies to them all. If, then, what holds of the numbers is like this, and someone posits that mathematical number alone exists, the one is not a starting-point (for the sort of one that the one is must differ from the other units; and, if this is so, there must also be a two that is primary among the twos, and similarly with the other successive numbers). But if the one is the starting-point, what holds of the numbers must rather be as Plato used to claim, and there must be a first two and three, and

595. I.e., by putting the things to be counted (the separate parts) into one-to-one correspondence with the natural numbers.
596. Reading ὑπάρχειν.
597. This concludes the discussion of Plato in particular.
598. E.g., Speusippus.

the numbers must not be combinable with each other. But if one posits this, many impossible results follow, as was said.[599] But then one or the other must hold, so that if neither does, number cannot be separable.

It is also evident from this that the third version[600] is the worst, in which Form number and mathematical number are the same number. For of necessity two errors then meet in one notion; for, first, mathematical number cannot possibly be this way; on the contrary, special hypotheses[601] must be posited to keep the view going, and, second, all the things that follow for those who speak of number as Form must also be accepted.

The Pythagorean version in one way has fewer difficulties than those mentioned, but in another way has others special to itself. For by not making number separable many of the impossibilities are done away with; but for bodies to be composed of numbers, and for this number to be mathematical, is impossible. For it is not true to say that there are indivisible spatial magnitudes, but even if it were true that they were fully this way, units at least have no magnitude—and how can a magnitude be composed of things that are indivisible? Moreover, arithmetical number, at any rate, is composed of units, while these thinkers say that the beings are numbers—at any rate, they apply their speculations to bodies on the supposition that the latter beings are composed of numbers.

If, therefore, it is necessary, if indeed number is an intrinsic being, for it to exist in one of the ways mentioned, and if none of these is possible, it is evident that number has no such nature as is furnished for it by those who make it separable.

Further, is each unit composed of the great and the small when they are equalized, or one of the small, another of the great? If the latter, each is not composed of all of the elements, nor will the units be undifferentiated (for in one the great belongs and in another the small, which is contrary in nature to the great).[602]

Further, how about the units in the three-itself? For one is left over.[603] But perhaps it is because of this that they make the one-itself the middle place in the odd numbers. And if each of its units is composed of both the great and the small equalized, how will the dyad, which is one nature, be composed of them? Or how will it differ from the unit?

Further, the unit is prior to the dyad (for when it is done away with, the dyad is done away with). It must, then, be the Form of a Form, because it is prior to a Form,

599. $1080^{b}37$–$1083^{a}17$.

600. That of Xenocrates.

601. $1090^{b}29$–30.

602. This is the first in a series of arguments, ending at $1086^{a}21$, directed against theories of numbers as separable intrinsic beings. These fall into five groups: how number is produced from the material starting-point (the indefinite dyad); how many Form numbers there are; the nature of the one; the starting-points of geometrical objects; and the difficulty of generating numbers from the one and multiplicity, or spatial magnitudes from similar starting-points.

603. The great and the small, as the dyad, is a two-maker of what it receives ($1082^{a}14$–15), and so cannot generate the one that is in the three-itself.

at any rate, and comes to be before it. From what, then? For the indefinite dyad[604] is a two-maker.

Further, number must be either limited or unlimited; for these thinkers make the numbers separable, so that it is not possible for neither of these not to belong to them. But that it is assuredly not possible for it to be unlimited is clear (for an unlimited number is neither odd nor even, but the generation of numbers is always of an odd number or of an even one—in one way, when the one applies to an even number, an odd number is produced; in another way, when the dyad applies, the numbers got from the one by doubling are produced; in another way, when the odd numbers apply, the other even numbers).

Further, if every Form is a Form of something, and the numbers are Forms, the unlimited number will be the Form of something, either of a perceptible or of something else. And yet this is not possible either in accord with their hypothesis or in accord with reason—but they do organize the Forms this way.

But if number is limited, how far does it go? With regard to this not only the that but also the why should be stated. But surely if the number series goes up to ten, as some people say, first the Forms will soon run out—for example, if three is man-itself, what number will horse-itself be? For a number that is a given thing-itself [is in a series that] goes up to ten. It must, then, be one of the numbers among these (for it is these that are substances and Forms). [But even if it is], nonetheless, they will run out (for the Forms of the animal will exceed them).

At the same time, it is clear that if it is in this way that the three is man-itself, the other threes are also (for those in the same numbers are similar), so that there will be an unlimited number of men—if each three is a Form, each will be man-itself; if not, they will all, at any rate, be men.

Also, if the smaller number is part of the greater (number that is composed of the combinable units present in the same number), then, if the four-itself is a Form of something (for example, horse or pale), man will be part of horse, if man is two.

It is absurd too for there to be a Form of ten but not of eleven or of the succeeding numbers.

Further, there both are and come to be things of which there are no Forms. So why are there not Forms of these too? Therefore, the Forms are not causes.

Further, it is absurd if the number series up to ten is a being and a Form to a higher degree than the ten-itself, and yet there is no generation of it as one thing, while of the latter there is. But they proceed on the assumption that the series up to ten is a complete number series. At any rate, they generate the derivative things—for example, the void, proportion, the odd, and other things of this sort—within the decad; for some things they assign to the starting-points—for example, movement, rest, good, bad—and the others to the numbers. That is why the odd is identified with the one; for if it was in the three, how could the five be odd?

604. I.e., the great and the small.

Further, spatial magnitudes and all such things go up to a certain number—for example, there is the first, the indivisible, line, then two, then the rest up to ten. **1084ᵇ1**

Further, if number is separable, one might raise a puzzle as to whether the one is prior, or the two or the three. Insofar, then, as the number is composite, the one is prior, but insofar as the universal and the form is prior, the number is prior; for each of the units is a part of the relevant number as its matter and the number is its form. And in a way the right angle is prior to the acute, because it is definite and because of its account, but in a way the acute is prior, because it is a part—that is, the right angle is divided into acute angles. As matter, then, the acute angle, the element, and the unit are prior, but as regards the form and the substance that is in accord with the account, the right angle, and the whole composed of the matter and the form, are prior; for what is both is closer to the form and to what the account is of, though posterior in coming to be. In what way, then, is the one a starting-point? Because it is not divisible, they say. But both the universal and the part or the element are indivisible, although they are starting-points in different ways, one in account and the other in time. In which of these ways, then, is the one a starting-point? For, as was said, the right angle seems to be prior to the acute, and the acute to the right, and each is one. They, then, make the one a starting-point in both ways. But this is impossible; for in one way it is a starting-point as form or substance, but in the other it is as part or as matter. For it is [only] in a way that each of the two is one, [since] in truth it is potentially (if, at any rate, the number is one and not like a heap, and if a distinct number is composed of distinct units, as they say) but not actually that each of the two is one.

And the cause of the error they fell into is that they were conducting their hunt [for starting-points] at the same time from the side of mathematics and from that of universal accounts. So from the former side they posited the one, the starting-point, as a point (for a point is a unit without position), and—just as some others have done—they put together the beings from the smallest things. So the unit becomes the matter of the numbers, and at the same time prior to the two—but also posterior, the two being treated as a whole, a one, and a Form. But because they were inquiring about the universal they treated the predicable one as also a part in this way. But these characteristics cannot belong at the same time to the same thing.

If the one must merely be without position (for it differs in no way [from other ones] except that it is a starting-point), and the two is divisible but the unit is not, the unit would be more like the one-itself. But if the unit is more like it, it must also be more like the unit than like the two. So each of the units [in the two] must be prior to the two. But this is something they deny—at any rate, they generate the two first.

Further, if the two-itself is a one and the three-itself is also a one, both together are a two. Of what, then, is this two composed? **1085ᵃ1**

13.9
Numbers as Separable Intrinsic Beings (2); Forms as Universals and Particulars

One might raise a puzzle—since in fact there is no contact in numbers but succession of units between which there is nothing, for example, between those in the two or in the three—as to whether these succeed the one-itself or not, and whether it is the two that is prior in succession or one of the units in it.

Similar difficulties also occur concerning the kinds of things that are posterior to number—line, plane, and body. For some people generate these from the forms of the great and the small—for example, lines from the long and short, planes from broad and narrow, and solids from deep and shallow (these being forms of the great and small). And the starting-point that corresponds to the one different thinkers describe in different ways. And here too it is evident that there are innumerable impossibilities, and fabricated things, and things that are contrary to all reason. For [the forms] are divorced from each other, unless their starting-points in fact mutually imply each other, so that the broad and narrow are also the long and short. But if this is so, the plane will be a line and the solid a plane. Further, what account will be given of angles, figures, and things of this sort? For the same happens here as with number; for these[, long and short,] are affections of magnitude, but magnitude is not composed of these, any more than the line is composed of straight and curved, or solids of smooth and rough.

Common to all these cases is precisely the same puzzle as arises in the case of the several forms as forms of a kind, when someone posits[605] the universals: whether it is the animal-itself that is in the particular animal or something other than animal-itself.[606] If it is not separable, this produces no puzzle. But if the one and the numbers are separable, as those who hold these views say, it is not easy to resolve the resulting puzzle, if one is to say that the impossible is not easy. For when someone grasps with his understanding the one that is in the two, or, in general, in number, does he grasp the thing itself or something else?

Some people, then, generate spatial magnitudes from matter of this sort,[607] while others[608] do so from the point—but the point seems to them to be not one but something like the one—and from other matter, which is like plurality, but not plurality. About these, the same puzzles arise nonetheless. For if the matter is one, line and plane and solid will be the same (for what is composed of the same things will be one and the same). But if the matters are more than one and there is one for the line and
1085b1 a second for the plane and another for the solid, either they imply each other or not,

605. Reading θῇ.
606. Reading αὐτοῦ ζῴου.
607. I.e., the various forms of the great and the small (1085a9–12).
608. E.g., Speusippus.

so that the same results will follow even so; for either the plane will not contain a line or it will be a line.

Further, in what way number can come from the one and plurality they make no attempt to explain. But whatever they say the same difficulties arise as for those who generate number from the one and the indefinite dyad.[609] For while some generate number from the plurality that is predicated universally, not from a particular plurality, others generate it from a particular plurality, the primary one (for the two is said to be a sort of first plurality). So there is practically no difference, but instead the same puzzles[610] will follow for mixture or position, blending, generation, or other such things.

Most of all, however, one should inquire about what each unit is composed of, if it is one; for each unit is certainly not the same as the one-itself. It must, then, be composed of the one-itself and plurality, or a part of plurality. But to say that the unit is a plurality is impossible, because it is indivisible, while if it is composed from a part of plurality, there are many other difficulties; for each of the parts must be indivisible (or it will be a plurality and the unit will be divisible), and the elements will not be the one and plurality (for the single units are not composed of plurality and one).

Further, the holder of this view does nothing but introduce another number; for his plurality of indivisibles is a number.

Further, one must inquire also[611] of those who speak in this way whether the number is unlimited or limited. For at the start, it seems, there was a limited plurality, from which, together with the one, the finite number of units are composed. But there is also another, plurality-itself, which is unlimited plurality. Which sort of plurality, then, is an element together with the one?

One might inquire similarly about the point, that is, the element from which they generate spatial magnitudes. For surely this is not the one point that alone exists. At any rate, one should ask: What is each of the other points composed of? For it is not composed, at any rate, from some distance together with the point itself. But then there cannot be indivisible parts of a distance either, as there can be of the plurality that units are composed of; for number is composed of indivisibles, while spatial magnitude is not.

All these considerations, then, and others of the sort, make it evident that it is impossible for number and spatial magnitude to be separable. Further, the discord about numbers between the various versions is a sign that it is the things themselves not being truly grasped that produces the confusion in these versions. For those who **1086^{a}1** make mathematical objects alone exist beyond the perceptibles, seeing the difficulty and made-up nature of the Forms, abandoned Form number and made mathematical number. But those who wish to make the Forms at the same time also numbers,

609. Plato, Xenocrates.
610. 1082^{a}20–26.
611. 1083^{b}36–1084^{a}1.

but did not see how, if someone posits these starting-points, mathematical number can exist beyond Form number, made Form number and mathematical number the same in name, since in fact mathematical number has been done away with (for the hypotheses they state are special and unmathematical). But the one who first posited that Forms exist, that the Forms are numbers, and that the objects of mathematics exist, with good reason separated them. So it turns out that all these thinkers speak correctly on some issue, but, in general, are incorrect. And they themselves confirm this, since they do not say the same things, but contrary ones. The cause is that their hypotheses and starting-points are false. And it is difficult, according to Epicharmus,[612] to speak correctly from things grasped incorrectly, for as soon as it is said, it is seen to be incorrect.

As regards numbers, then, the puzzles have been gone through and the distinctions drawn are enough. For while someone who is already persuaded might be further persuaded by more, someone not yet persuaded would come no closer to being persuaded.

Concerning the primary starting-points and the primary causes and elements, however, some of what is said by those who speak only about perceptible substance has been discussed in our studies concerning nature, while some does not belong to the present methodical inquiry. But what is said by those who assert that there are other substances beyond the perceptible ones is something one needs to get a theoretical grasp on next after what has been discussed. Since, then, some people say that the Forms and the numbers are things of this sort, and that the elements of these are elements and starting-points of the beings, what they say and in what way they mean it must be investigated.

Those who posit numbers only, and these mathematical ones, must be investigated later.[613] Regarding those who accept the Forms, however, one might well at the same time get a theoretical grasp on their version and on the puzzles they face. For they at the same time make the Forms universal and contrariwise treat them as separable and as particulars. But that this is not possible is a puzzle that was gone through before.[614] The cause of the conjoining of these two characteristics in one and the same thing on the part of those who spoke of their substances as universals is that they did not make their substances the same as the perceptibles. They thought that the particulars in the realm of perceptible things were flowing and that none of them remains the same, but
1086b1 that the universal was both beyond these and something distinct from them. This, as we said in our previous discussion,[615] was stirred up by Socrates, because of his definitions, but he did not separate these from the particulars—and he understood things correctly in not separating them. This is clear from the results; for without universals it is not possible to get scientific knowledge, but separating them is the

612. Also 1010a6.
613. 1090a7–15, 1090a20–b20.

615. 1078b17–34.

cause of the subsequent difficulties regarding the Forms. The others, supposing that if indeed there are going to be any substances beyond the perceptible and flowing ones, it is necessary for them to be separable, had no others, but set-out the universal predicables, so that it followed that universals and particulars were practically the same natures. This in itself, then, would be one difficulty for the view just described.

13.10
The Separability of Elements and Starting-Points; the Scientific Knowability of Substances

Let us now discuss an issue that presents a certain puzzle[616] both to those who accept the Forms and those who do not, and which was stated before, at the start, when going through the puzzles. For if one does not posit substances to be separate, and in the way in which particular things are said to be separate, one will do away with the sort of substance we wish to maintain. But if one posits substances to be separable, in what way should we posit their elements and starting-points to be?

For if they are particular and not universal, there will be just as many of the beings as there are elements, and the elements will be scientifically unknowable. For suppose that the syllables in voiced sound are substances and that their elements are the elements of substances. Then there must be [only] one BA and one of each of the [other] syllables, if indeed they are not universal and the same in form, but rather each is one in number and a this something and not a thing the same in name [as something else]. (Besides, these thinkers posit the what a thing is as being in each case one.[617]) But if the syllables are this way, so too are the things they are composed of. Therefore, there will not be more As than one, or more than one of any of the other elements either, based on the same argument on which[618] in the case of the syllables there will not be more than one instance of the same one. But then if this is so, there will not be other beings beyond the elements, but only the elements. Further, the elements will not be scientifically knowable either; for they are not universal, but scientific knowledge is of universals, as is clear from demonstrations and from definitions; for a deductive proof that this triangle has [its interior angles equal to] two right angles does not come about unless every triangle has [interior angles equal to] two right angles, nor that this human is an animal, unless every human is an animal.

But if the starting-points are universal, either the substances composed of them are also universals,[619] or non-substance will be prior to substance; for the universal is not a substance, but the element or the starting-point is universal, and an element or starting-point is prior to the things of which it is an element or starting-point.

616. P12 $1003^{a}5$–17.
617. Reading ἔτι . . . ἕκαστον τιθέασιν.
618. Secluding τῶν ἄλλων.
619. Reading ἢ . . . ἢ.

All these difficulties, then, follow reasonably, when these thinkers make the Forms be composed of elements and also claim that beyond the substances that have the same form there are Forms, [each of which] is a single separate thing. But if, as in the case of the elements of voiced sound, there is nothing to prevent there being many As and Bs without there being any A-itself or a B-itself beyond the many, then, in view of this, there will be unlimitedly many similar syllables.

The fact that all scientific knowledge is universal, so that the starting-points of the beings must also be universal and not separate substances, involves the greatest puzzle of those mentioned.[620] But though there is surely a way in which what is said is true, there is another way in which it is not true. For scientific knowledge, like knowing scientifically, is twofold, one potential, the other active: the potential, being, as matter, universal and indefinite, is of what is universal and indefinite, while the activity, being definite, is of what is definite—being a this something of a this something. But it is only coincidentally that sight sees universal color, because this [particular instance of] color that it sees is a color, and so what the grammarian theoretically grasps, this [particular instance of] A is an A; since, if the starting-points must be universal, what comes from them must also be universal, as in the case of demonstrations. And if this is so, there will be nothing separable and no substance either. But it is clear that in one way scientific knowledge is universal, while in another way it is not.

BOOK 14 (NU)

14.1
Contraries Cannot Be Starting-Points

About this sort of substance, then, let this much be sufficient.

All [thinkers] make the starting-points contraries: as in natural things, so also in the case of the immovable substances. But if it is impossible for there to be anything prior to the starting-point of all things, the starting-point cannot be a starting-point by being another thing.[621] This would be as if someone were to say that the white is a starting-point, not insofar as it is another thing, but insofar as it is white, yet that it is said of an underlying subject, and that it is white by being another thing; for in that case the underlying subject will be prior. But all things come to be from contraries as belonging to some underlying subject. Therefore, an underlying subject must be present above all in the case of contraries. Therefore, all contraries are always
1087b1 said of an underlying subject and so none is separable. But just as it appears that nothing is contrary to substance,[622] so too argument testifies to this. No contrary,

620. P12 1003a5–17, P_{14} 1060b19–23.
621. 987b23.
622. *Cat.* 3b24–27.

therefore, is the starting-point of all things in the controlling way, but there is another starting-point.

But these thinkers[623] make one of the contraries matter, some making the unequal matter for the one, the equal,[624] as if inequality were the nature of plurality, and another[625] making plurality matter for the one (for the numbers are generated, for the former, from the dyad of the unequal, the great and small, and, for the latter, from plurality, but for both they are generated by the substance of the one); for even the thinker[626] who says that the unequal and the one are the elements, and that the unequal is a dyad composed of the great and the small, speaks of the unequal or the great and the small as being one, and does not draw the distinction that they are one in account but not in number. But then they do not even give a correct account of the starting-points they call "elements." Some speak of the great and the small along with the one, and treat these three as elements of the numbers, the dyad being matter, the one the shape [or form]. Others[627] speak of the many and the few, because the great and the small are more appropriate in their nature to magnitude than to number. Others[628] speak instead of the universal that is over these: the exceeder and the exceeded.

However, these variations make (one might almost say) no difference with respect to some of the consequences, but only with respect to the logico-linguistic difficulties, which these thinkers take care to avoid, because the demonstrations they themselves carry out are logico-linguistic. Except that the very same argument that makes the exceeder and the exceeded the starting-points, and not the great and the small, also makes number come from the elements prior to the two coming from them; for in both cases they are the more universal. As things stand, however, they accept one of these things but do not accept the other.

Other thinkers oppose the other and the another to the one, and others plurality to the one.[629] But if, as they wish to maintain, the beings are composed of contraries, and either there is nothing contrary to the one, or, if indeed there is going to be anything it is plurality, and if the unequal is contrary to the equal, and the other to the same, and the another to the thing itself, those who oppose the one to plurality have the view with most going for it. But even their view is inadequate; for the one will then be a few; for plurality is opposed to fewness and many to few.

It is evident, however, that the one signifies a measure. And in every case there is another thing, an underlying subject—for example, in a musical scale, it is a quarter-tone, in spatial magnitude, a finger or a foot or something else of the sort, in rhythms,

a beat or a syllable, and similarly in weight, some standard weight. And in all cases it
1088^a1 is the same way, in qualities it is a quality, in quantities a quantity. And the measure is indivisible, in form for qualities and perceptually for quantities, as the one is not intrinsically substance of anything. And this stands to reason; for one signifies the
5 measure of some plurality, and number signifies a measured plurality and a plurality of measures (that is why it is quite reasonable for the one not to be a number; for the measure is not measures; on the contrary, what both the measure and the one are is a starting-point). The measure, though, must always be some self-same thing belonging to all [the relevant cases]—for example, if horse is the measure, to horses, and if human, to humans, and if human or horse or god, perhaps to living being, and
10 the number of them will be a number of living beings. But if the things are human, pale, and walking, there will scarcely be a number of them, because they all belong to the same thing, which is one in number—nonetheless, there will be a number of kinds of them, or of some other such term.

Those who posit the unequal as something that is one, but the dyad as an indef-
15 inite thing composed of great and small, make claims that are very far from being plausible or possible; for the latter are affections and coincidents, rather than underlying subjects, of numbers and magnitudes—the many and the few of number and the great and the small of magnitude—just like even and odd, smooth and rough,
20 straight and curved.

Further, besides this error, the great and the small, and the other things of this sort, must be relative to something. But the relative is least of all a nature or a substance, and is posterior to quality and quantity. Also, the relative, is an affection
25 of quantity, as was said, not its matter, since another thing is [matter] for both the relative generally,[630] and for its parts and forms. For there is nothing either great or small, many or few, or, in general, relative to something that is not great or small, many or few, or relative to something, by being another thing.

A sign that the relative is least of all a substance and a being is that of it alone there
30 is neither coming to be nor passing away nor movement, as with respect to quantity there is growth and withering, with respect to quality alteration, with respect to place spatial movement, with respect to substance unconditional coming to be and passing away. But with respect to the relative there are none of these; for, without being moved or changed, a thing will be now greater and now less or equal, if the other
35 thing has moved with respect to quantity. Also, the matter of each thing, and so of
1088^b1 substance, must be what is potentially this sort of thing. But the relative is neither potentially nor actively substance. It is absurd, then, or rather, impossible, to make what is not a substance an element in, and prior to, substance; for all the categories are posterior to substance.

Further, elements are not predicated of the things they are elements of, while many
5 and few are predicated both separately and together of number, and long and short of

630. Rejecting the additions of ἢ and ὑπόκειται.

line, and both broad and narrow apply to plane. If there is a plurality, then, of which the one term, the fewness, is always [predicated],[631] such as the two (for if it were many, one would be few), there must also be a plurality that is unconditionally many, such as the ten, if there is no number that is greater than it, or ten thousand. How, then, in view of this, can number be composed of few and many? For either both should be predicated of it, or neither. As things stand, however, only one or the other is.

14.2
Eternal Things as Consisting of Elements; the One Plus Something Else as Elements; How Not Being Can Come from Being and Be Many

One should investigate in an unconditional way whether eternal things can consist of elements; for then they will have matter; for everything that is composed of elements is composite. Therefore, if something that is composed of something, even if it always exists, would of necessity, if it had come to be, also have come to be from it, and if everything that comes to be does so from something that is potentially what it comes to be (for it could not have come to be or exist from something that did not have this potential), and if what has this potential can be active or not, then however eternal number or anything else that has matter may be, it would admit of not existing, just like what lasts a single day and what lasts for so-and-so many years. But if this is so, what has existed for so long a time that it has no limit admits of not existing too. Therefore, things that consist of elements cannot be eternal, if indeed what admits of not existing is not eternal, as we have had occasion to busy ourselves about in other accounts.[632] If, however, what is being said now is true universally, that no substance is eternal if it is not activity, and if the elements are matter of what is a substance, no eternal substance can be composed of elements present in it.

But there are some people[633] who make the element that is together with the one an indefinite dyad, and reasonably object to the unequal, because of the impossible consequences. But they get rid only of those difficulties that necessarily follow as a result of making the unequal and the relative an element. But these people must also face those difficulties that arise separately from this notion, whether it is Form number they produce from these elements or mathematical number.

There are many causes that led these thinkers astray in the case of these causes, but especially the fact that they raised the puzzle in an archaic way. For they believed that all the beings would be one, namely, Being-itself, if one did not resolve, and had not

631. Reading οὗ τὸ μὲν ἀεί, τὸ ὀλίγον.
632. $1050^{b}6$–22, *Cael.* 1.12.
633. E.g., Xenocrates.

traveled to the same place as, the argument of Parmenides: "for never will this prevail, that things that are not, are."[634] Instead, they thought it necessary to prove that not being is; for only in this way, from being and something else, could the beings be composed, if they are many.

And yet, in the first place, if being [is said of things] in many ways (for it signifies sometimes substance, sometimes quality, sometimes quantity, and at other times the other categories), what sort of one, then, will all the beings be, if there is no not being? Will it be substances, or qualities, and the others likewise? Or will they all be one—the this, the of such-and-such sort, the so-and-so much, and the others that signify one something? But it is absurd—or, rather, impossible—for a single sort of nature to become the cause of a being's being a this, being of such-and-such sort, being so-and-so much, and being in a place.

Second, of what sort of not being and being will the beings be composed? For in fact not being is [said of things] in many ways, since in fact being is; and not being a human signifies not being a this, not being straight signifies not being of such-and-such sort, and not being three cubits signifies not being so-and-so much. Of what sort of being and not being, then, are the beings composed so as to be many? He[635] means the false and calls this sort of nature "not being," from which, together with being, the beings are composed so as to be many. That is why it also used to be said that something false must be assumed, as geometers assume what is not a foot long to be a foot long. But this cannot be so, for geometers do not assume anything false,[636] either, for it is not a premise of the deduction, nor is it not being in this sense that the beings come to be from or pass away into. But since there are as many cases in which things are said not to be as there are categories, and beyond these the false is said not to be, as is what *is* potentially, it is from this last one that there is coming to be—human from what is not human but is potentially human, white from what is not white but is potentially white, and similarly whether it is one thing that comes to be or many.

It is evident that their inquiry is how being in the sense of substance can be many; for the things that come to be [in their view] are numbers and lines and bodies. Yet it is absurd [for them] to inquire how being in the sense of the what-it-is can be many, but not how quality or quantity can be. For surely the indefinite dyad or the great and the small is not a cause of there being two whites, or many colors, or flavors or shapes; **1089b1** for then these too would be numbers and units. But then if they had approached these issues, they would have seen what the cause is in the case of substances too; for the cause is the same or analogous.

In fact, this deviation is also what causes them—when they were inquiring about the opposite of being and one (from which, together with these, the beings are

634. B7 DK.
635. Plato, *Sophist* 237a, 240d.
636. *APr.* 49b33–37, *APo.* 76b39–77a3.

composed)—to posit the relative or the unequal, which is neither the contrary nor the contradictory of these, but one nature of the beings, just like the what[-it-is] and quality.

They should have also inquired about this, how relatives are many and not one. But as things stand, they inquire how there can be many units beyond the primary one, but do not proceed to inquire how there can be many unequals beyond the unequal. And yet they make use of them and speak of great and small, many and few (from which the numbers are composed), long and short (from which the line is composed), broad and narrow (from which the plane is composed), and deep and shallow (from which the solids are composed), and they mention yet more forms of the relative. What is the cause, then, of these being many?

It is necessary, then, as we say, to assume for each thing what it is potentially. But the thinker who stated the previous things went on to declare what it is that is potentially a this and a substance but is not a being intrinsically, namely, that it is the relative (just as if he had said the qualitative), which is not potentially one or being, nor the negation of one or of being, but instead one of the beings. And so it was much more necessary, as was said, if he was inquiring how the beings are many, not to inquire about those in the same category—how there are many substances or many qualities—but how the beings are many; for some of them are substances, some qualities, and some relatives.

In the case of the other categories there is something else to give us pause about how there can be many. For because they are not separable it is by their underlying subject's coming to be many and being many that both qualities and quantities are many. And yet there must, surely, be a matter for each kind, except it cannot be separable from substances.

In the case of this somethings, however, [matter] is a reason why the this something can be many—unless there is a thing that is both a this something and a nature such as this.[637] The puzzle here is rather the following: how there can be many active substances and not one.

But again if the this and quantity are not the same, it is not said how and why the beings are many, but rather how quantities are many. For all number signifies a quantity of some sort, and so does the unit, unless it signifies a measure or the quantitatively indivisible.[638] If, then, quantity and the what-it-is are distinct, it is not said what the what-it-ises are composed of or how they can be many, and if someone says they are the same, there are many inconsistencies he has to face. **1090ᵃ1**

One might also focus the investigation concerning numbers on the question of where one should get the conviction that they exist from.[639] To the thinker who posits Forms they provide some sort of cause for the beings, if indeed each number is a

637. I.e., both a particular and a universal (1086ᵃ32–34).

638. Reading καὶ τὸ κατὰ τὸ ποσὸν ἀδιαίρετον.

639. Beginning here and continuing to 1091ᵃ12 is a discussion of the notion of separately existing numbers that differs little if at all from the discussion in 13.2–3.

certain Form, and the Form is for the other things in some way or other the cause of their being (for let us grant them this assumption). But what about the one[640] who does not think in this way, because of seeing the difficulties about Forms inherent in it (so that this is not why he posits numbers), but who does posit mathematical number—where should one get the belief that this sort of number exists from, and of what use is it for the other things? For there is nothing that the thinker who claims this says that it causes (he rather says that it is a sort of intrinsic nature). Nor is it evident that it is the cause of anything; for the theorems of the arithmeticians will all apply equally well to perceptible things, as was said.[641]

14.3
The Existence of Numbers and Mathematical Objects

Those, then, who posit that the Forms exist and that they are numbers, in virtue of setting-out each thing beyond the many and taking each to be one, try at least to say in a way why number exists. Since, however, the things they say are neither necessary nor possible, one must not—because of these things, at any rate—say that number exists. But the Pythagoreans, because they saw many of the affections of numbers to belong to perceptible bodies,[642] made the beings be numbers—not separable numbers, however, but they made the beings be composed of numbers. Why so? Because the affections of the numbers are present in a musical scale and in the heaven and in many other things. Those, however, who say that mathematical number alone exists cannot, in accord with their hypothesis, say anything of this sort. Instead, it used to be said [on their behalf] that there cannot be sciences of these [perceptible things]. But we claim that there are, as we said previously.[643] And it is clear that the objects of mathematics are not separate; for if they were separate their affections would not be present in bodies. In this regard the Pythagoreans are open to no objection, but in that they make the natural bodies be composed of numbers, things with lightness and weight be composed of things that have neither lightness nor weight, they seem to be speaking of another heaven and of other bodies but not of the perceptible ones. Those who make number separable suppose it to exist and be separable on the grounds that the axioms will not be true of perceptibles, while [mathematical] statements are true and gladden the soul; and **1090b1** similarly with mathematical magnitudes. It is clear, then, that the contrary account will say the contrary, and that the puzzle just raised, as to why if numbers are in no way present in perceptibles their affections are present in perceptibles, has to be resolved by those who say these things.

640. Speusippus.
641. 1077b17–30.
642. Rejecting the addition of ἐν.
643. 13.3.

There are some people who, because the point is the limit and extremity of the line, the line of the plane, and the plane of the solid, think that there must be natures of this sort. One should, then, examine this account too, and see whether it is not exceedingly weak. For substances the extremities are not, but all these are instead limits (since even of walking, and of movement in general, there is a limit, so that it would be a this something and a certain substance; but that is absurd). But even if they are, they will all be among the perceptibles (for it was to these that the account applied). Why, then, will they be separable?

Further, if one is not very indifferent to suffering, one might press the inquiry regarding all number and the objects of mathematics, that they make no contribution to each other, the prior to the posterior (for if number did not exist, nonetheless spatial magnitudes would exist for those who maintain the existence only of the objects of mathematics, and if spatial magnitudes did not exist, soul and perceptible bodies would exist; but nature does not seem, on the basis of the appearances, to be episodic, like a bad tragedy).

As for those who posit the Forms, this criticism misses them; for they produce spatial magnitudes from matter and number, lengths from the two, planes presumably from three, and solids from the four, or from other numbers as well—which it is makes no difference. But will these magnitudes be Forms, or what way do they exist? And what do they contribute to the beings? In fact, nothing—just like the objects of mathematics, these contribute nothing. But then no theorem even applies to them either, unless one wishes to change the objects of mathematics and produce some special notion of one's own. It is not difficult to assume any hypotheses whatever and go on at great length stringing things together. These thinkers, then, are in error in striving to unite the objects of mathematics with the Forms in this way.

And neither of those who first posited two sorts of numbers, Form number and mathematical number, have said nor can say in what way mathematical number exists or what it is composed of. For they make it an intermediate between Form number and perceptible number. For if it is composed of the great and the small, it will be the same as the other—the Form—number, and from what other small and great does he[644] produce magnitudes? If he names some other one, the elements he **1091^{a}1** names will be many. Also, if the starting-point of each of them is a one, the one will be something common to these, and one must inquire how the one can be this many things, while at the same time number cannot, according to him, be generated except from the one and an indefinite dyad.

All this, then, is absurd, and conflicts both with itself and with what is reasonable, and one seems to see in it the "long story" of Simonides;[645] for a long story, like the [excuse] of slaves, comes about when people have nothing sound to say. And the

644. Plato.

645. Probably Simonides of Ceos; what his "long story" was is unclear.

very elements—the great and the small—seem to object loudly to being dragged in;
10 for they cannot in any way generate number except what is got from [the] one by two-making.

It is absurd too to posit a coming to be of things that are eternal—or, rather, it is one of the things that are impossible. There should be no doubt about whether the Pythagoreans do or do not posit their coming to be; for they say plainly that
15 when the one had been composed, whether of planes, of surface, of seed, or of something they are at a loss to describe, immediately the closest part of the unlimited began to be constrained and limited by the limit. But since they are engaged in world-making and wish to speak like natural scientists, it is fair to examine them somewhat on what they say about nature, but to leave them out of the
20 present methodical inquiry; for we are examining the starting-points that are in the immovable things, so that it is numbers of this sort whose coming to be must be investigated.

14.4
The Relation of Mathematical Elements and Starting-Points to the Good and the Noble

They[646] say that there is no coming to be of the odd, clearly implying that there is coming to be of the even. As for the even, some present it as the first thing to come
25 from unequals—the great and the small—when these are equalized. The inequality, then, must belong to them prior to their having been equalized. And if they had always been equalized, they would not have been unequal prior to that (for there is nothing prior to what has always been). So it is evident that they are not positing the coming to be of the numbers [merely] for the sake of getting a theoretical grasp on them.

It is a puzzle, however, and a reproach to being in a puzzle-free condition, as to
30 how the elements and the starting-points are related to the good and the noble. The puzzle is whether any of the elements is the sort of thing we mean by the good-itself and the best good, or whether this is not so, but these are later in their coming to be than the elements.

The theologians seem to agree with some thinkers of the present day[647] who say
35 no—rather, it is only when the nature of the beings has progressed that both the good and the noble make their appearance. (They do this to avoid a real difficulty that confronts those who say, as some do, that the one is a starting-point. The diffi-
1091b1 culty arises, however, not because they ascribe the good to their starting-point as an affection, but because they make the one a starting-point—and a starting-point in

646. Platonists.
647. E.g., Speusippus.

the sense of an element—and generate number from the one.) The early poets agree with this same view, insofar as they say that it was not the first [gods] that reigned and ruled (for example, Night and Heaven or Chaos or Ocean), but Zeus. But then they were led to say these things because they think of the rulers of the beings as changing. Although those among them whose views are a mixture, in that not everything is stated in a mythological way (for example, Pherecydes, as well as some others), posit the primary generator as the best good, as do the Magi and some of the later wise men, such as both Empedocles and Anaxagoras, the former making love an element and the other making [divine] understanding a starting-point. Among those, though, who assert the existence of the immovable substances, some say that the one-itself is the good-itself, but they thought its substance to be most of all its oneness.

This, then, is the puzzle: Which of the two ways should one speak? But it would be absurd if to what is primary, eternal, and most self-sufficient, this very thing—self-sufficiency and preservation—belongs primarily in some other way than as a good. But then it is not because of anything other than its good state that it is incapable of passing away or self-sufficient. So to say that the starting-point is like this is quite probably true. But for it to be the one or, if not that, an element, at any rate, and an element of numbers, is impossible. For great difficulties result (to avoid which some[648] have renounced the view, namely, those who agree that the one is a primary starting-point and element, but only of mathematical number); for each unit becomes precisely what is a sort of good, and there is a great abundance of goods. Further, if the Forms are numbers, each of the Forms will be precisely what is a sort of good. But let someone posit Forms of anything he wishes; for if these are Forms only of goods, the Forms will not be substances, while if the Forms are also of substances, all animals, plants, and all the participants in a Form will be good.

These absurdities follow, then, and it also follows that the contrary element, whether plurality or the unequal, that is, the great and small, is the bad-itself (which is why one thinker[649] avoided attaching the good to the one, because it would necessarily follow, since coming to be is from contraries, that the bad would be the nature of plurality, while others say that inequality is the nature of the bad). It follows, then, that all the beings participate in the bad except one, the one-itself, and that numbers participate in it in a more undiluted way than spatial magnitudes, and that the bad is the place of the good,[650] and that it participates in and desires what is destructive of it; for contrary is destructive of contrary. And if, as we were saying, the matter is what is potentially a given thing (for example, the matter of what is actively fire is what is potentially fire), the bad will itself be the potentially good.

All this follows, then, partly because they make every starting-point an element, partly because they make contraries be starting-points, partly because they make the

648. E.g., Speusippus.

649. Speusippus. Cf. *NE* 1096ᵇ5–7.

650. I.e., the good, which is the object of desire and wish, has its place taken by the bad, which the good now desires to realize or resemble.

one a starting-point, partly because they make the numbers the primary substances, and make them separable and Forms.

14.5
How the Beings Come from Numbers and Other Related Puzzles

If, then, it is equally impossible not to put the good among the starting-points and to put it there in this way, it is clear that the account of the starting-points and of the primary substances has not been correctly given. Nor is someone[651] correct in his supposition when he compares the starting-points of the whole to that of animals and plants, on the grounds that the more complete always comes from the indefinite and incomplete, and is led by this to say that this also holds of the primary starting-points, so that the one-itself is not even a being. For even here the starting-points from which these things come are complete; for it is a human that begets a human, and the seed is not primary.

And it is absurd to generate place at the same time as the mathematical solids (for place is special to particular things, which is why they are separable by place, while the objects of mathematics are not anywhere). It is also absurd to say that the mathematical solids must be somewhere, but not to say what this place is.

People who say that beings come from elements and that the primary beings are the numbers should have said in which way number comes from the starting-points as follows, by distinguishing the ways in which one thing comes from another. Is it by mixture? But not everything is mixable; what is produced is something distinct; and the one will not remain separate and a distinct nature,[652] which they wish it to be. By mode of composition, like a syllable? But then the elements must have position, and the person who understands the one and the plurality will understand them separately. This, then, is what number will be—unit plus plurality, or the one and the unequal.

Also, since coming from certain things means in one way that they are still present as components, and in another way that they are not, which way holds of numbers? For the case in which they are present as components is possible only for things that come to be. Is it, then, in the way that things come from seed? But nothing can come away from what is indivisible. From a contrary that does not persist? But everything that comes to be in this way also comes to be from something else that does persist. Therefore, since one thinker[653] posits the one as contrary to the plurality, and another **1092b1** (treating the one as equal) as contrary to the unequal, number must be supposed to come from contraries. There is, then, something else that persists, from which, together with the other of the two factors, number is or has been generated.

651. Speusippus.
652. *GC* 327b22–26.
653. Speusippus.

Further, why precisely do other things that come from contraries, or that have contraries, pass away (even when they come from all of it), while number does not? For nothing is said about this. And yet whether present as a component or not present as a component a contrary always destroys [its contrary], just as strife destroys mixture (and yet it should not have; for that is not its contrary).

But nothing has been determined at all about the way in which the numbers are the causes of substances and of being. Is it as boundaries (as points are of spatial magnitudes) and as Eurytus assigned a certain number to belong to a certain thing (for example, one to human and another to horse), by using pebbles to copy the shape of living things, as some people put numbers in the shapes of a triangle or a square? Or is it because concord is a ratio of numbers, and so is human and each of the others? But the affections—the white and sweet and the hot—how are they numbers? And that the numbers are neither a thing's substance nor causes of its shape [or form] is clear; for the ratio is the substance, while the number is the matter[654]—for example, the substance of flesh or bone is number in this way, three parts of fire and two of earth.[655] And a number, whatever number it is, is always a number of something, of fire or earth or units. The substance, by contrast, consists in their being so-and-so much of one thing to so-an-so much of another in the mixture. And this is no longer a number but a ratio of a mixture's numbers, whether corporeal or of some other sort.

Number, then, is not a cause by producing things (whether number in general or number composed of abstract units), nor matter, nor a ratio and form of things. But then it is not the cause as the for-the-sake-of-which either.

14.6
More on Numbers and the Good: Ratios

One might, though, raise a puzzle about what the good is that things get from the numbers by the fact that their mixture is based on a number, whether easily calculable or odd.[656] For as things stand honey-water is no more healthy if it is mixed in the proportion of three times three; on the contrary, it would be more beneficial if it were mixed in no particular ratio, but were watery, than if it were based on a number, but were badly mixed.

Further, the ratios of mixtures are based on the adding of numbers, not merely on numbers—for example, it is three parts to two, not three times two. For in multiplications the factors must be of the same kind, so that the product of $1 \times 2 \times 3$ must be measurable by 1, and $4 \times 5 \times 6$ by 4; so all [products of the same factor] must be measurable by that factor. The number of fire, then, cannot be $2 \times 5 \times 3 \times 6$ and that of water 2×3.

654. Reading ὕλη.
655. Reading ἀριθμὸς ἡ οὐσία οὕτω.
656. *Sens.* 439^{b}25–30.

1093a1 If all things must share in number, though, it must follow that many things are the same, and that the same number must belong to one thing and also to another. Is the number the cause, then, and is this why the thing exists, or is this unclear? For example, there is a number proper to the spatial movements of the sun, as again to those of the moon, as well as to the life expectancy and prime, indeed, of each of the animals. What, then, is to prevent some of these numbers from being squares, some others cubes, and some equal, others double? In fact, there is nothing to prevent it. Instead, all things must turn and change within these limits, if all things share in number. And it was also possible for different things to fall under the same number, so that if things happened to have the same number, they would be the same as each other, because of having the same form of number—for example, the sun and the moon would be the same.

But why are these numbers causes? There are seven vowels, the harmonic scale consists of seven strings, the Pleiades are seven, at seven animals lose their teeth (some do, at least, some do not), and there were seven heroes against Thebes. Is it then because of the nature of such a number that the heroes were seven or that the Pleiad consists of seven stars? Surely, the heroes were seven because there were seven gates or due to some other cause, and while we count the Pleiad as seven and the Bear as twelve, others count more stars in them.

They even say that the letters *xi*, *psi*, and *zeta* are concords, and that there are three of these [double consonants] because there are three concords. They do not care at all that there might be a thousand such letters, since, for example, one symbol might be assigned to *gamma* and *rho* together. But if they reply that each of these three is equal to two of the other letters, while none of the others is, and the cause of this is that there are three regions of the mouth[657] and one letter is applied to *sigma* in each, it is because of this that there are only three, not because there are three concords, since there are in fact more than three, but there cannot be more than three double consonants.

These people, then, are like the early Homeric scholars, who see small resemblances but overlook large ones.

Some further say that there are many such cases—for example, that the middle strings are nine and eight,[658] that the epic verse has seventeen syllables, which is equal in number to these strings, and that the line scans in the right [or first] half with **1093b1** nine syllables, and in the left [or second] with eight. And they say that the distance in letters from *alpha* to *omega* is equal to that from the lowest note of the pipe to the highest, and that its number is that of the whole system of the heaven.[659] It must

657. The three regions are the palate, the lips, and the teeth, against which the tongue is placed in pronouncing *xi*, *psi*, and *zeta*, pronounced S/DA.

658. The middle strings are the fourth and fifth, which are represented by the ratios 9:6 and 8:6.

659. Perhaps because there are twelve signs of the zodiac, eight heavenly spheres (that of the fixed stars and those of Saturn, Jupiter, Mars, Venus, Mercury, sun, moon) and four elements, and 12 + 8 + 4 = 24, which is the number of letters in the Greek alphabet.

be observed, however, that no one should be at a loss to state or to discover such resemblances in eternal things, since they can be found even in things that pass away.

But the celebrated natures of the numbers and their contraries, and those in mathematics generally, as some people describe them and make them causes of nature seem to vanish, when they are investigated in this way, at any rate; for none of them is a cause in any of the ways that were distinguished with respect to the starting-points. In a way, however, they make it evident that the good does belong here, and that the odd, the straight, the square, the powers of certain numbers, are in the column of the noble; for the seasons and a certain sort of number go together, and all the other examples that they collect together on the basis of mathematical speculations have this force. That is why they seem like chance occurrences; for they are indeed coincidences (although they all properly belong with each other), but are one by analogy; for in each category of being there is something analogous—as the straight is in length, so in surface is the level, and perhaps, in number the odd, and in color the white.

Further, it is not the Form numbers that are the causes of harmonic relations and the like (for equal Form numbers differ from each other in form; for even their units do), so that one does not have to posit Forms because of this, at any rate.

These, then, are the consequences [of the theory], and yet more might be adduced. And the fact that these thinkers have such a hard time with the generation of the numbers and are incapable of stringing things together in any way at all seems to be a sure sign that the objects of mathematics are not separable from perceptibles, as some say, and that the starting-points are not these.

NICOMACHEAN ETHICS*

BOOK 1

1.1
Goods and Ends

Every craft and every methodical inquiry and likewise every action and deliberate choice seem to aim at some good. That is why they correctly declare that the good is what all aim at. **1094a1**

A certain difference, however, appears to exist among ends; for while some are activities, others are works of some sort beyond the activities themselves. But wherever there are ends beyond the actions, in those cases, the works are naturally better than the activities. And since there are many sorts of actions and of crafts and sciences, their ends are many as well; for health is the end of medicine, a ship of shipbuilding, victory of generalship, and wealth of household management. 5

But since some of these fall under some one capacity, as bridle making falls under horsemanship, along with all the others that produce equipment for horsemanship, and as it and every action in warfare fall under generalship, in the same way, others fall under different ones—in all such cases, the ends of the architectonic ones are more choiceworthy than the ends under them; for these are pursued for the sake also of the former. It makes no difference whether the ends of the actions are the activities themselves or some other thing beyond them, just as in the sciences we have mentioned. 10 15

1.2
Ethics Is a Sort of Politics

If, then, there is some end of things doable in action that we wish for because of itself, and the others because of it, and we do not choose everything because of something else (for if that is the case, it will go on without limit, so that the desire will be empty and pointless), it is clear that this would be the good—that is, the best good. Therefore, regarding our life as well, will knowing the good have great influence and—like archers with a target—would we be better able to hit what one should? If so, one 20

* Translated by C. D. C. Reeve. Text: I. Bywater, *Ethica Nicomachea* (Oxford, 1894).

must try to grasp in outline, at least, what precisely the good is and to which of the sciences or capacities it properly belongs.

It would seem to be the one with the most control, and the most architectonic one. And politics appears to be such; for it is the one that prescribes which of the sciences need to exist in cities and which ones each group in cities must learn and up to what point. And we see that even the capacities that are most honored are under it—for example, generalship, household management, and rhetoric. And since it uses the other practical sciences,[1] and further, legislates about what must be done and what avoided, its end would encompass those of the others, so that it would be the human good.

For even if the good is the same for an individual and for a city, that of a city is manifestly a greater and, at any rate, a more complete good to acquire and preserve; for while it must content us to acquire and preserve this for an individual alone, it is nobler and more divine to do so for nations and cities. Our methodical inquiry, then, aims at the good of these things—for it is a sort of politics.

1.3
Exactness in Ethics

Our account would be adequate if its degree of perspicuousness were in accord with its subject matter; for we must not seek the same degree of exactness in all accounts, any more than in all products of the crafts.

Noble things and just things, which are what politics investigates, admit of so much difference and variability that they seem to exist by conventional law alone and not by nature. Good things seem to admit of variability in the same way too, because they result in harm to many people; for some have in fact been destroyed because of wealth, others because of courage. It must content us, then, in an account that concerns and is in accord with such things, to prove the truth roughly and in outline, and—in an account that concerns things that hold for the most part and is in accord with them—to reach conclusions of the same sort too. It is in the same way, then, that we must also take each of the things we say; for it is characteristic of a well-educated person to look for the degree of exactness in each kind of investigation that the nature of the subject itself allows; for it is evident that accepting persuasive arguments from a mathematician is much the same as demanding demonstrations from a rhetorician.

But each person correctly judges the things he knows and is a good judge of these. Therefore, a person well educated in a given area is a good judge in that area, while a person well educated in all areas is an unconditionally good judge. That is why a young person is not a proper listener for politics; for he has no experience

1. Reading πρακτικαῖς.

of the actions of life, and the accounts are in accord with these and concerned with these.

Further, since he tends to follow his feelings, it will be pointless and not beneficial for him to listen, since the end is not knowledge but action. And it makes no difference whether he is young in years or youthful in character; for the deficiency is not a matter of time but is due to living and pursuing each thing in accord with feelings. For to people like that, knowledge turns out to be profitless in just the way it does to those who lack self-control. To those who form their desires and do their actions in accord with reason, however, it would be of great benefit to know about these things.

So much for the prefatory remarks concerning the listener, how our discussion is to be received, and what we are proposing to do.

1.4
Views about Happiness

Let us, then, resume our account. Since every sort of knowledge and every deliberate choice reaches after some good, let us say what it is that politics aims at—that is, what the topmost of all the good things doable in action is.

About its name, most people are pretty much agreed; for both ordinary people and sophisticated ones say it is happiness and suppose that living well and doing well are the same as being happy. Concerning happiness, however, and what it is, they are in dispute, and ordinary people do not give the same answer as wise ones. For ordinary people think it is one of the plainly evident things, such as pleasure or wealth or honor—some taking it to be one thing, others another. And often even the same person thinks it is different things; for when he gets a disease, it is health, while when he is poor, it is wealth. But when these people are conscious of their own ignorance they are wonder-struck by those who proclaim some great thing that is over their heads. And some people used to think that, beyond these many good things, there is another intrinsically good one that causes all of them to be good.

It is presumably quite pointless to inquire into all these beliefs, and enough to inquire into those that are most prevalent or that seem to have some argument for them.

We must not let it escape our notice, however, that arguments leading from starting-points and arguments leading to starting-points are different. For Plato too was rightly puzzled about this and used to inquire whether the route was leading from starting-points or to starting-points—as, in a stadium racecourse, that of the athletes may lead away from the starting-point toward the boundary or in the reverse direction. For we must start from things that are known. But things are known in two **$1095^{b}1$** ways; for some are known to us, some unconditionally. Presumably, then, one must start from things known to us.

That is why one must be nobly brought up if, where noble things, just things, and the subject matter of politics as a whole are concerned, one is to be an adequate listener. For the starting-point is the that and, if this is sufficiently evident, we do not also need the why. A person who is nobly brought up, then, either has the starting-points or can easily get hold of them. And as for the one who neither has nor can get hold of them, he must listen to Hesiod:

> Best of all is the one who understands everything himself,
> Good too is that person who is persuaded by one that has spoken well.
> But he who neither understands it himself nor by listening to another
> Takes it to heart, that one is a useless man.[2]

1.5
Three Sorts of Lives

But let us take up our account at the point where we digressed.[3] For people seem (which is not unreasonable) to get their suppositions about the good—that is, happiness—from their lives. Ordinary people, indeed, the most unrefined ones, suppose it to be pleasure. And that is why the life they like is the life of indulgence. For there are three lives that stand out: the one we just mentioned, the political, and, third, the contemplative.

Ordinary people seem wholly slavish, because the life they deliberately choose is one that is characteristic of grazing cattle. But they get a hearing for their choice because many of those in positions of authority feel the same as Sardanapalus.

Sophisticated people, on the other hand, and doers of action, deliberately choose honor; for it is pretty much the end of the political life. But it is apparently more superficial than what we are seeking; for it seems to be in the hands of the honorers more than of the honorees, while we divine that the good is something that properly belongs to us and is difficult to take away. Further, people seem to pursue honor in order to be convinced that they are good—at any rate, they seek to be honored by practically wise people, among people who know them, and for virtue. It is clear, then, that according to them, at least, virtue is better.

Maybe one might even suppose that it is more the end of the political life than honor is. But even virtue is apparently too incomplete [as an end]; for it seems possible to have virtue even while sleeping or being inactive throughout life or while suffering evils and bad luck of the worst sort. Someone who was living like that, **1096ᵃ1** however, no one would call "happy" unless he was defending a thesis at all costs. That is enough about these issues, since they have also been adequately discussed in the studies that are in circulation.

2. Hesiod, *Works and Days* 293, 295–297.
3. 1095ᵃ22.

The third life is the contemplative one, which we will undertake to investigate in what follows.

The life of a moneymaker is in a way forced, and it is clear that wealth is not the good we are seeking; for wealth is useful and for the sake of something else. Hence we might be more inclined to suppose that the things already mentioned are the end, since they are liked because of themselves. But they are apparently not the end either—indeed, many arguments have been presented against them. We may, then, set them aside.

1.6
Plato on the Good

But perhaps we had better investigate the universal good and go through the puzzles concerning the way in which it is said of things, even if this sort of inquiry is an uphill one because the men who introduced the Forms were friends of ours.[4] But perhaps it would seem better, even necessary, at any rate, when the preservation of the truth is at stake, to do away even with what is properly our own, especially so as we are philosophers; for while we love both our friends and the truth, the pious thing is to honor the truth first.

Those, then, who introduced this view did not posit Forms for things among which they spoke of prior and posterior, which is why they did not furnish a Form of the numbers. But good is said of things in the categories of what-it-is, quality, and relative, and what is intrinsically—that is, substance—is naturally prior to relative (for it would seem to be an offshoot or coincidental affection of what is), so that there would not be some common Form set over these.

Further, good is said of things in as many ways as being. For it is said of things in the category of what-it-is (for example, the god and the understanding), in that of quality (the virtues), in that of quantity (the moderate amount), in that of the relative (the useful), in that of time (the opportune moment), in that of place (a livable dwelling), and so on. Therefore, it is clear that it would not be some common universal—that is, a one; for then it would not be said of things in all the categories but only in one.

Further, if of things that are in accord with one Form there is also one science, then of all goods there would also be some one science. But as things stand there are many, even of goods in one category—for example, of the opportune moment (for in war it is generalship but in disease medicine) and of the moderate amount (in nourishment it is medicine, while in physical exertion it is physical training).

4. Plato and some of his followers.

One might also raise a puzzle about what they even mean by "each-thing-itself,"[5] if indeed of both human-itself and human there is a single account—that of human. For insofar as each is human, they will not differ at all, and, if this is the case, neither will they differ, insofar as each is good.

Neither will the good-itself be more good by being eternal, if indeed a long-lasting white thing is no whiter than an ephemeral one.

The Pythagoreans seem to have something more convincing to say about this, since they place the one in the column of goods—and, indeed, Speusippus seems to have followed their lead.

But let us leave these issues for another discussion.

A controversial point, however, does lie concealed in what we have said, because their arguments are not concerned with every good. The things said in accord with one Form are those pursued and liked as intrinsic goods, while those that tend to produce or safeguard these, or to prevent their contraries, are said to be good because of these and in a different way. It is clear, then, that good would be said of things in two ways, that is, of some as intrinsic goods, of others as goods because of these. Let us separate off, then, the intrinsic goods from the ones that produce a benefit, and investigate whether intrinsic goods are said to be good in accord with a single Form.

The intrinsic ones, though, what sorts of things should one suppose them to be? Or aren't they the ones that are pursued on their own as well—for example, being wise, seeing, and certain pleasures and honors? For even if we do pursue these because of other things, we might nonetheless suppose them to belong among the intrinsic goods. Or does nothing else belong there except the Form? In that case, the Form will be pointless. But if these other things belong among the intrinsic ones too, the same account of the good will have to show up in all of them, just as that of whiteness does in snow and white lead. But in fact the accounts of honor, wisdom, and pleasure differ and are at variance regarding the very way in which they are goods. Therefore, the good is not something common and in accord with a single Form.

But how, then, is it said of things? For at least it does not seem to be a case of homonymy resulting from luck. Is it, then, that all goods at least derive from or are related to a single thing? Or is it more a matter of analogy? For as sight is in the case of body, so understanding is in the case of soul, and so on for other things in other cases.

But perhaps we must leave these questions aside for now, since an exact treatment of them more properly belongs to a different branch of philosophy.[6] It is the same way in the case of the Form; for even if there is some single good predicated in common of all intrinsic goods, a separable one that is itself an intrinsic good, it is clear that it would not be doable in action or acquirable by a human being. But that is the sort that is being sought now.

5. *Met*. 1040b32–34.

6. I.e., dialectic. See *EE* 1217b16–19.

Maybe someone might think it better to get to know the Form in connection with the goods that are acquirable and doable in action; for they might think that by having it as a paradigm, we will also better know those things that are good for us and—knowing them—aim at and hit them. This argument certainly has some plausibility, but it seems to clash with the sciences; for each of these, though it seeks some good and looks for how to supply whatever is lacking, leaves aside knowledge of the Form. And yet for all craftsmen not to know—and not even to look for—so important an aid would hardly be reasonable.

There is a puzzle too about how a weaver or a carpenter will benefit, as regards his own craft, from knowing the good-itself or how anyone will be a better doctor or a better general from having seen the Form-itself. For the doctor appears not even to investigate health in this way, but rather that of the human being, and perhaps even more the health of this one; for he treats a particular one.

So much, then, for these issues.

1.7
Completeness, Self-Sufficiency, and Human Work

Let us return to the good we are seeking and what exactly it could be. For it is apparently different in different actions and different crafts; for it is one thing in medicine, a different one in generalship, and likewise for the rest. What, then, is the good characteristic of each? Or isn't it the thing for whose sake the rest of the actions are done? In medicine this is health, in generalship victory, in building a house, and in other crafts something else, and in every action and deliberate choice it is the end; for it is for the sake of the end that everyone does the rest. So if there is some end of all the things doable in action, this would be the good doable in action; and if more than one, it would be these.

Taking a different course, then, our account has reached the same conclusion.[7] But we must try to make this yet more perspicuous.

Since there are manifestly many ends, and we choose some of them because of something else, as we do wealth, pipes, and instruments generally, it is evident that not all ends are complete. But the best one is apparently something complete. So if one thing alone is complete, this would be what we are seeking, but if more are, the most complete of these.

We say that what is intrinsically worth pursuing is more complete than what is worth pursuing because of something else, and that what is never choiceworthy because of something else is more complete than what is both intrinsically choiceworthy and choiceworthy because of this one, and, accordingly, that what

7. $1094^{a}21$–22, $1094^{b}6$–7, $1095^{a}16$–17.

is unconditionally complete is what is always intrinsically choiceworthy and never choiceworthy because of something else.

Happiness seems to be most like this; for it we always choose because of itself
1097b1 and never because of something else. But honor, pleasure, understanding, and every virtue, though we do choose them because of themselves as well (for if they had no further consequences, we would still take each of them), we also choose for the sake of happiness, supposing that through them we will be happy. Happiness, on the
5 other hand, no one chooses for the sake of these things or because of anything else in general.

The same conclusion also apparently follows from self-sufficiency; for the complete good seems to be self-sufficient. By "self-sufficient," however, we mean not self-sufficient for someone who is alone, living a solitary life, but also for parents,
10 children, wife, and friends and fellow citizens generally, since a human being is by nature political. Of these, some defining mark must be found; for if we extend the list to ancestors and descendants and to friends' friends, it will go on without limit. But we must investigate this on another occasion. In any case, we posit that the self-sufficient is what, on its own, makes a life choiceworthy and lacking in nothing,
15 and this, we think, is what happiness is like.

Further, we think it is the most choiceworthy of all things, when not counted among them. But if it is counted among them, it clearly would be more choiceworthy with the addition of the least of goods; for what is added would bring about a superabundance of goods, and, of goods, the greater one is always more choiceworthy.

20 Happiness, then, is apparently something complete and self-sufficient, being the end of what is doable in action.

But perhaps to say that happiness is the best good appears to be something [generally] acknowledged, and a clearer statement of what it is is still required. Maybe, then, this would come about if the work of the human being were
25 grasped. For just as for a pipe player, a sculptor, every craftsman, and in general for whatever has some work and action, the good—the doing well—seems to lie in the work, the same also seems to hold of a human being, if indeed there is some work that is his.

Are there, then, some works and actions of a carpenter and of a shoemaker but
30 none at all of a human being? And is he by nature idle? Or, rather, just as of eye, hand, foot, and of each part generally there seems to be some work, may we likewise also posit some work of a human being that is beyond all these?

What, then, could this be? For living is manifestly shared with plants as well, but we are seeking what is special. Therefore, we must set aside the living that consists in
1098a1 nutrition and growth. Next in order is some sort of perceptual living. But this too is manifestly shared with the horse, the cow, and every animal.

There remains, then, some sort of practical living of the part that has reason. And of what has reason, one part has it due to obeying reason, the other due to having

it and exercising thought. But living is said of things in two ways, and we must take the one in accord with activity; for this seems to be called "living" in a fuller sense.

If, then, the work of a human being is activity of the soul in accord with reason or not without reason, and the work of a sort of thing, we say, is the same in kind as the work of an excellent thing of that sort (as in the case of a lyre player and an excellent lyre player), and this is unconditionally so in all cases, when we add to the work the superiority that is in accord with the virtue (for it is characteristic of a lyre player to play the lyre and of an excellent one to do it well)—if all this is so, and a human being's work is supposed to be a sort of living, and this living is supposed to be activity of the soul and actions that involve reason, and it is characteristic of an excellent man to do these well and nobly, and each is completed well when it is in accord with the virtue that properly belongs to it—if all this is so, the human good turns out to be activity of the soul in accord with virtue and, if there are more virtues than one, then in accord with the best and most complete.[8] Further, in a complete life. For one swallow does not make a spring, nor does one day, nor, similarly, does one day or a short time make someone blessed and happy.

Let the good, then, be sketched in this way; for perhaps one should outline first and fill in the details later. But it would seem that anyone can develop and articulate the things in the outline that have been correctly done, and that time is a good discoverer and co-worker in such matters. This is even the source of advances in the crafts; for anyone can produce what is missing.

We must also remember what was said previously and not seek exactness in everything alike but in each case one that is in accord with the subject matter and to the degree sought by the methodical inquiry that properly belongs to it. For in fact a carpenter and a geometer inquire differently about the right angle. A carpenter does so to the degree that is useful for his work, while a geometer inquires about what it is or what sort of thing; for he is a contemplator of the truth. We must do things in just the same way, then, in other cases, so that side issues do not overwhelm the works themselves.

Neither must we demand the cause in all cases alike. Rather, in some cases it will be adequate if the fact that they are so has been correctly proved—as it is indeed where starting-points are concerned. And the that is a first thing and a starting-point. **1098^{b}1**

We get a theoretical grasp on some starting-points through induction, some through perception, some through some sort of habituation, and others through other means. In each case one must try to pursue each sort in the way appropriate to its nature and make very serious efforts to define them correctly; for they are of great and decisive importance regarding what follows. It seems indeed that the starting-point is more than half the whole, and that many of the things we were inquiring about will become evident through it.

1.8
The Argument Defended

We must investigate happiness, however, not only in accord with the conclusions and premises of our argument but also in accord with the things we say about it; for all the facts are in tune with a true view, while the truth soon clashes with a false one.

Goods, then, have been divided into three sorts, with some said to be external, some relating to the soul, and some to the body. The goods relating to soul are most fully such, and, we say, are goods to the highest degree, and we take the actions and activities of the soul to be goods relating to soul. So what we have said is correct, according to this view at least, which is of long standing and agreed to by philosophers.[9]

It is correct even in saying that actions and activities of some sort are the end; for that way the end turns out to be one of the goods relating to soul, and not one of the external ones.

The saying that the one who is happy both lives well and does well is also in tune with our argument; for happiness has been pretty much defined as a sort of living well and doing well.

Again, all the things that are looked for where happiness is concerned apparently hold of what we have said it is. For to some it seems to be virtue, to others practical wisdom, to others some sort of theoretical wisdom, while to others it seems to be these, or one of these, involving pleasure or not without pleasure. Other people include external prosperity as well. Some of these views are held by many and are of long standing, while others are held by a few reputable men. And it is not reasonable to suppose that either group is entirely wrong, but rather that they are correct on one point at least or even on most.

With those who say[10] that happiness is virtue or a certain sort of virtue, our argument is in tune; for activity in accord with virtue is characteristic of virtue. But it makes no small difference, presumably, whether we suppose the best good to consist in virtue's possession or in its use—that is, in the state or in the activity. For it is possible for the state to exist while accomplishing nothing good—for example, for
1099a1 the person who is sleeping or out of action in some other way. But the same will not hold of the activity; for he will necessarily be doing an action and doing it well. And just as in the Olympic Games it is not the noblest and strongest who get the victory crown but the competitors (for it is among these that the ones who win are found), so also among the noble and good aspects of life it is those who act correctly who win the prizes.

9. E.g., Plato, *Euthydemus* 279b–c, *Philebus* 48e, *Laws* 743e.
10. *EE* 1215a24.

Further, their life is intrinsically pleasant. For being pleased is among the things that belong to soul, and to each person the pleasant is that by reference to which he is said to be a lover of such-and-such—as, for example, a horse in the case of a lover of horses, and a play in that of a lover of plays. In the same way, just things are pleasant to a lover of justice and the things in accord with virtue as a whole are pleasant to a lover of virtue.

The things that are pleasant to ordinary people, however, are in conflict because they are not by nature pleasant, while it is the things by nature pleasant that are pleasant to lovers of what is noble. And actions in accord with virtue are like this, so that they are pleasant both to such people and intrinsically.

Their life, then, has no need of a pleasure that is superadded to it, like some sort of appendage, but has the pleasure within itself. For besides what we have already said, the person who does not enjoy doing noble actions is not good; for no one would call a person "just" who did not enjoy doing just actions, or generous if he did not enjoy doing generous ones, and similarly as regards the others.

If that is so, however, actions in accord with virtue would be intrinsically pleasant. But they are also good, of course, and noble as well. Further, they are each of these things to the highest degree, if indeed an excellent person judges them correctly—and he judges them in the way we have said.

Therefore, happiness is what is best, noblest, and most pleasant. And these are not distinguished in the way the Delian inscription says:

> The noblest thing is the most just; the best to be healthy;
> Most pleasant of all, however, is to get what one loves.[11]

For the best activities possess them all. And it is these—or the one among them that is best—that we say happiness is.

Nonetheless, it apparently needs external goods to be added, as we said;[12] for it is impossible or not easy to do noble actions without supplies; for just as we perform many actions by means of instruments, we perform many by means of friends, wealth, and political capacity. Then again, there are some whose deprivation disfigures blessedness, such as good breeding, good children, and noble looks; for we scarcely have the stamp of happiness if we are extremely ugly in appearance, ill-bred, living a solitary life, or childless, and have it even less, presumably, if our children or friends are totally bad or were good but have died.

Just as we said,[13] then, happiness does seem to need this sort of prosperity to be added. That is what leads some people to identify good luck with happiness and others to identify virtue with happiness.

1.9
How Happiness Is Achieved

It is also what leads people to puzzle about whether happiness is something acquirable by learning or by habituation or by some other sort of training, or whether it comes about in accord with some divine dispensation or even by luck.

But if anything is a gift from the gods to human beings, it is reasonable to suppose that happiness is also god given—especially since it is the best of human things. But though perhaps this issue properly belongs more to a different investigation, it is evident that, even if happiness is not a godsend but comes about through virtue and some sort of learning or training, it is one of the most divine things; for virtue's prize and end is manifestly something both divine and blessed. At the same time, it would also be something widely shared; for it is possible for it to be acquired through some sort of learning or supervision by all those not disabled in relation to virtue.

If it is better to acquire it in that way than to be happy by luck, however, it is reasonable to suppose that this is how we do acquire it, if indeed what is in accord with nature is by nature in the noblest possible condition. It is the same way with what is in accord with craft or with any cause whatsoever—above all, what is in accord with the best one. To entrust what is greatest and noblest to luck would strike a very false note.

The answer we are seeking is also entirely evident from our argument; for we have said that happiness is a certain sort of activity of the soul in accord with virtue, while of the remaining goods, some are necessary conditions of it, others are by nature co-workers and useful as instruments. This also would agree with what we said at the start;[14] for we took the end of politics to be the best end. And its supervision aims above all at producing citizens of a certain sort—that is, good people and doers of noble actions.

It makes perfect sense, then, that we do not say that a cow, a horse, or any other animal whatsoever is happy; for none of them can share in this sort of activity. **1100a1** It is due to this cause that a child is not happy either; for he is not yet a doer of such actions because of his age. Children who are said to be happy are considered "blessed" because of our expectations. For, as we said,[15] happiness requires both complete virtue and a complete life. For many reversals of luck and all sorts of lucky accidents occur in life, and the most prosperous may meet with great disasters in old age—just as is said of Priam in the story of the events at Troy. And no one counts someone happy who has suffered strokes of luck like that and dies in a wretched way.

1.10
When to Count a Human Being Happy

Are we then to count no other human being happy either, as long as he is still living but—in accord with Solon's advice—must see the end? And if we are indeed to accept this view, is it really the case that someone is happy only when he is dead? Or is that a completely strange notion—most of all for those who say, as we do, that happiness is a sort of activity?

Even if we do not say that a dead person is happy, however—and this is not what Solon means either, but that when a human being has died it would at that point be safe to call him "blessed" (as then being outside the reach of bad things and misfortunes)—that is also something we might dispute to some extent; for to some extent it does seem that something may prove good or bad for the one who is dead, if indeed there are also good or bad things for the one who is living but not actively perceiving them—for example, honor and dishonor, and children or descendants generally who do well or who suffer strokes of bad luck.

But this also raises a puzzle; for it is possible for many reversals of luck involving his descendants to befall the one who has lived a blessed life until old age and died accordingly. Some of his descendants may be good people and get the life they deserve while to others the contrary may happen. And it is clear that the degree of separation between them and their ancestors admits of all sorts of variation. But it would be strange, surely, if the dead person changed along with them and was happy at one time and, again, wretched at another. But it would also be strange if what happens to descendants did not affect their ancestors to any extent or for any period of time.

But we must go back to the first puzzle; for maybe from that we would also be able to get a theoretical grasp on what we are now inquiring about. Suppose that we must wait to see the end in each case and at that point call someone "blessed"—not as at that time being blessed but because he was so before. Wouldn't it be strange, then, if when he is happy, we cannot truly attribute to him what he actually possesses, because of our not wishing to call the living "happy" because of reversals of luck, and because we suppose that happiness is something stable and in no way easy **1100b1** to reverse, while luck often turns completely around in the case of the same person? For it is clear that if we were to be guided by luck, we would often have to say that the same person is happy and then wretched, turn and turn about, thereby representing the happy person as a sort of chameleon and as someone with unsound foundations.

Or is it that to be guided by luck is not at all correct? For it is not in luck that living well and living badly are to be found, but a human life needs this to be added, as we said,[16] while it is activities in accord with virtue that control happiness and the contrary ones its contrary. The puzzle we are now going through further testifies to our argument; for none of the works of human beings are as stable as the activities in

16. 1099b6–7.

accord with virtue; for they seem to be more stable even than our knowledge of the sciences. And of these activities themselves, the most estimable ones are more stable, because the blessed live most of all and most continuously in accord with them; for this would seem to be the cause of why forgetfulness does not occur about them.

What we are inquiring about, then, will be characteristic of the happy person, and throughout life he will be as we say; for he will always or more than anyone else do actions and get a theoretical grasp on things in accord with virtue, and will bear what luck brings in the noblest way and, in every case, in the most suitable way, as one who is "truly good, foursquare, beyond blame."[17]

Many things happen in accord with luck, however, that differ in greatness and smallness. But small strokes of good luck, or similarly of the opposite, clearly will not turn the scale of his life, while great and repeated ones, when good, will make his life more blessed (for by nature they even help adorn it, and his use of them is noble and excellent). If they turn out the reverse, they reduce or spoil blessedness; for they involve pain and impede many activities. Nonetheless, even in these cases nobility shines through when someone calmly bears repeated strokes of great bad luck—not because he is insensitive to suffering but because of being well-bred and great-souled.

If, however, it is activities that control living, as we said,[18] no blessed person would ever become wretched; for he would never do hateful or base actions. For a truly good and wise person, we think, bears what luck brings graciously and, making use of the resources at hand, always does the noblest actions, just as a good general makes the best uses in warfare of the army he has and a good shoemaker makes the best shoes out of the hides he has been given, and the same way with all other craftsmen.

But if this is so, a happy person would never become wretched—nor blessed certainly—if he runs up against luck like Priam's. He is not, then, variable or easily subject to reversals of luck; for he will not be easily shaken from his happiness by just any strokes of bad luck that chance to come along but only by great and repeated ones. And from these he would not return to being happy again in a short time but—if indeed he does do so—in a long and complete one in which he achieves great and noble things.

What, then, prevents us from calling "happy" the person who is active in accord with complete virtue and is adequately supplied with external goods not for some random period of time but in a complete life? Or must we add that he will continue living like that and will die accordingly, since the future is obscure to us and we suppose happiness to be an end and complete in every way? If so, we will call "blessed" those living people who have and will continue to have the things we mentioned—blessed, though, in the way human beings are.

So much for our determinations on these issues.

1.11
Death and Happiness

The view that the luck of someone's descendants and all his loved ones has not the slightest effect on him is manifestly a view too inimical to friendship and one that is contrary to the beliefs held on the subject. But since the things that happen are many and admit of all sorts of differences, and some of them get through to us more and others less, it is manifestly a long—even endless—task to distinguish all the particular cases, and it would perhaps be enough to speak about the matter in universal terms and in outline.

If, then, of even the strokes of bad luck that affect the person himself, some have a certain weight and turn the scale as regards his life, while others seem to have a lighter one, the same also holds for what affects all his friends. And for each incident, it makes a difference whether it involves the living or the dead—much more than whether the unlawful and terrible deeds in tragedies have happened beforehand or are enacted on the stage.

Our deductive argument, then, must also take account of this difference, but even more account, perhaps, of the results of going through the puzzles about whether the dead share in any good thing or in any of the opposite ones. For it seems likely from these considerations that even if anything at all does get through to them, whether **1101b1** good or the opposite, it is something feeble and small, either unconditionally so or so for them. Or if it is not like that, it is of a size and sort, at any rate, that does not make happy those who are not happy or take away the blessedness of those who are. It does, then, contribute something to the dead, apparently, when their friends do well and similarly when they do badly, but something of such a sort and size that it neither makes the happy ones unhappy nor does anything else of this sort.

1.12
Is Happiness Praiseworthy or Estimable?

Having made these determinations, let us investigate whether happiness is included among praiseworthy things or, rather, among estimable ones; for it is clear that it is not included among capacities, at any rate.

It appears, then, that all the things that are praiseworthy are praised for being of a certain quality and for standing in a certain relation to something; for we praise the just person and the courageous one—in fact, the good person and virtue generally—because of the actions and the works involved, also the strong person and the good runner, and so on in each of the other cases, because he is naturally of a certain quality and stands in a certain relation to something good or excellent. This is also clear from awards of praise involving the gods; for these are manifestly ridiculous

if it is by reference to us that they are awarded. But this happens because awards of praise involve such a reference, as we just said.

If praise is of things like this, it is clear that of the best things there is no praise but something greater and better—as is in fact evident; for we call the gods both "blessed" and "happy" and call the most divine of men this as well. It is the same way in the case of goods too; for we never praise happiness as we praise justice, but consider it blessed, since it is a more divine and better thing.

It seems, in fact, that Eudoxus advocated in the correct way the cause of pleasure in the competition for supremacy; for not to praise pleasure, while including it among the goods, is to indicate, he thought, that it is better than things that are praised, in the way that the god and the good are; for it is to these that the others are referred.

For praise is properly given to virtue (for we are doers of noble actions due to it), while encomia are properly given to its works, in like manner both to those of the body and those of the soul. But perhaps an exact treatment of these issues more properly belongs to those who work on encomia. It is clear to us from what we have said, however, that happiness is included among things both estimable and complete.

This also seems to hold because happiness is a starting-point; for it is for the sake of it that we all do all the other actions that we do, and we suppose that the starting-point and cause of goods is something estimable and divine.

1.13
The Soul and Its Virtues

Since happiness is some activity of the soul in accord with complete virtue, we must investigate virtue; for maybe that way we would also get a better theoretical grasp on happiness. It seems too that the one who is truly a politician has worked most on virtue; for he wishes to make the citizens good and obedient to the laws. A paradigm case is provided by the Cretan and Spartan legislators and by any others there may have been that are like them. If this investigation belongs to politics, however, it is clear that our present inquiry would be in accord with the deliberate choice we made at the start. But it is clear that the virtue we must investigate is human virtue; for it is in fact the human good we were seeking, and human happiness.

By "human virtue," though, we mean not that of the body but that of the soul. And happiness, we say, is an activity of the soul. But if all this is so, it is clear that a politician must in a way know about what pertains to the soul, just as the one who is going to take care of people's eyes must know about the body generally—more so, indeed, to the extent that politics is more estimable and better than medicine—and that doctors (the ones who are more sophisticated) occupy themselves greatly with knowing about the body. It is also for a politician, then, to get a theoretical grasp on what concerns the soul. But his theoretical grasp must be for the sake of the things in

question and of an extent that is adequate to the things being looked for; for a more exact treatment is perhaps harder work than the issues before us require.

Enough has been said about some aspects of the soul in the external accounts too, and we must make use of these—for example, that one part of the soul is non-rational, while another part has reason. Whether these are distinguished like the parts of the body or like anything else that is divisible or whether they are two in account but inseparable by nature (like convex and concave in a curved surface) makes no difference for present purposes.

Of the non-rational part, one part seems to be shared and vegetative—I mean, the cause of nutrition and growth; for this sort of capacity of soul is one that we suppose is present in all things that take in nourishment, even embryos, and that this same one is also present in completely grown animals; for that is more reasonable than to **1102[b]1** suppose a different one to be present in them.

The virtue of this capacity, then, is apparently something shared and not [distinctively] human; for this part and this capacity seem to be most active in sleep, and a good person and a bad one are least clearly distinguished during sleep (leading people to say that the happy are no different from the wretched for half their lives; and this makes perfect sense; for sleep is idleness of the soul in that respect with reference to which it is said to be excellent or base), unless—to some small extent—some movements do get through to us and, in this way, the things that appear in the dreams of decent people are better than those of any random person. But that is enough about these things, and we must leave the nutritive part aside, seeing that by nature it has no share in human virtue.

Another natural constituent of the soul, however, also seems to be non-rational, although it shares in reason in a way. For we praise the reason—that is, the part of the soul that has reason—of a person with self-control and of a person without it; for it exhorts them correctly toward what is best. But they also have by nature something else within them besides reason, apparently, which fights against reason and resists it. For just as with paralyzed limbs (when their owners deliberately choose to move them to the right, they do the contrary and move off to the left), so it is in the case of the soul as well; for the impulses of people who lack self-control are in contrary directions. In the case of the body, to be sure, we see the part that is moving in the wrong direction, while in the case of the soul we do not see it. But presumably we must nonetheless acknowledge that in the soul as well there is something besides reason, countering it and going against it. How it is different is not important.

But this part apparently also has a share of reason, as we said;[19] at any rate, this part of the self-controlled person is obedient to reason. Further, that of the temperate and courageous person, presumably, listens still better; for there it chimes with reason in everything.

19. $1102^{b}13–14$.

Apparently, then, the non-rational part is also twofold. For the vegetative part does not share in reason in any way but the appetitive part (indeed, the desiring part as a whole) does so in some way, insofar as it is able to listen to reason and obey it. It has reason, then, in the way we are said to have the reason of our fathers and friends and not in the way we are said to have that of mathematics. The fact that the non-rational part is persuaded in some way by reason is revealed by the practice of warning people and by all the different practices of admonishing and exhorting them.

1103a1 If we must say that it too has reason, however, then the part that has reason will be double as well—one part having it fully and within itself, the other as something able to listen to it as to a father.

Virtues are also defined in accord with this difference; for we say that some are of thought, others of character. Theoretical wisdom, comprehension, and practical wisdom are virtues of thought; generosity and temperance virtues of character. For when we talk about someone's character we do not say that he is theoretically wise or has comprehension but that he is mild-mannered or temperate. But we do also praise a theoretically wise person with reference to his state, and—among the states—it is the praiseworthy ones that we call "virtues."

BOOK 2

2.1
The Importance of Habit

Virtue, then, is twofold, of thought and of character. That of thought both comes about and increases mostly as a result of teaching, which is why it requires experience and time. That of character (*êthikê*), on the other hand, results from habit (*ethos*)—indeed, this is the source of the name *êthikê*, which derives with a minor variation from *ethos*.

From this it is also clear that none of the virtues of character comes about in us by nature; for no natural being can be habituated to be otherwise—for example, a stone that by nature spatially moves downward cannot be habituated to spatially move upward, not even if to habituate it you were to throw it upward ten thousand times, nor fire to move downward, nor can anything else that is by nature one way be habituated into being another way. Therefore, the virtues come about in us neither by nature nor against nature; rather, we are naturally receptive of them and are brought to completion through habit.

Further, in the case of things that are provided to us by nature, we first receive the capacities for them and later exhibit the activities. (Precisely this is clear in the case of the perceptual modalities; for it was not from frequent acts of

seeing or of hearing that we acquired the perceptual modalities; rather, it was the reverse—we used them because we had them, we did not have them because we used them.) The virtues, by contrast, we acquire by first engaging in the activities, as is also true in the case of the various crafts; for the things we cannot produce without learning to do so are the very ones we learn to produce by producing them—for example, we become builders by building houses and lyre players by playing the lyre. In the same way, then, we become just people by doing just actions, temperate people by doing temperate actions, and courageous people by doing courageous ones. **1103b1**

What happens in cities also testifies to this; for legislators make citizens good by habituating them; that is to say, this is the wish of every legislator, and those legislators who do not do it well fail in their purpose, and it is in this respect that one constitution differs from another, a good one from a base one.

Further, it is from the same things and through the same things that each virtue both comes about and is destroyed. The case of a craft is similar as well; for it is from playing the lyre that both good and bad lyre players come about. And something analogous holds in the case of builders and all the rest; for it is from building houses well that good builders arise and from doing so badly, bad ones.

If it were otherwise, there would have been no need whatsoever of a teacher, but people would all have been born either good or bad [craftsmen]. This, then, is also how it is with the virtues; for it is from acting as we do in our transactions with other human beings that some of us become just and others unjust, and from acting as we do in terrible circumstances and from becoming habituated to feel fear or confidence that some of us become courageous and others cowards. Something similar also holds of circumstances involving appetites and those involving feelings of anger; for some people become temperate and mild-mannered, while others become intemperate and irascible—the one group from conducting themselves in one way in such circumstances, the other from doing so in another way. In a word, then, states come about from activities that are similar to them.

That is why the activities must exhibit a certain quality; for the states follow along in accord with the differences between these. It makes no small difference, then, whether people are habituated in one way or in another way straight from childhood; on the contrary, it makes a huge one—or rather, all the difference.

2.2
Ethics Is a Practical Science

Since, then, the present study is not undertaken for the sake of theoretical knowledge, as our others are (for we are engaging in the investigation not in order to know what virtue is but in order to become good people, since otherwise there would be nothing of benefit in it), we must investigate what relates to actions, that

is, in what way they are to be done; for actions also control what sorts of states will come about, as we said.

That one must act in accord with correct reason is a common view and is to be assumed—we will talk about it later, both about what correct reason is and about how it is related to the various virtues.

Let us take it as agreed in advance, however, that the entire account of issues relating to the actions we must do has to be stated in outline and not in an exact way, and—as we said[20] at the start—the sorts of accounts we demand must be in accord with the subject matter. But things in the sphere of action and advantageous things have no fixed identity, just as healthy ones have none.

While that is what the universal account is like, the account dealing with particular cases is still less exact; for these do not fall under any craft or any set of rules whatsoever, and the agents themselves always have to inquire to find out what it is opportune to do, just as in the case of medicine and navigation. But even though this is what the present account is like, one must still try to provide help.

First, then, we must observe that states like these are naturally destroyed by deficiency and excess, just as we see happen in the cases of strength and health (for we must use evident cases to testify on behalf of obscure ones); for both athletic training regimens that are excessive and those that are deficient destroy our strength, and routines of drinking and eating too much destroy our health, while those involving commensurable amounts produce, increase, and preserve it.

It is also that way, then, with temperance, courage, and the other virtues. For the one who avoids and fears everything and endures nothing becomes cowardly, while the one who fears nothing at all and goes to face everything becomes rash. Similarly, the one who indulges in every pleasure and abstains from none becomes intemperate, while the one who avoids all of them, as boorish people do, becomes insensitive in a way. Temperance, then, and courage are destroyed by excess and deficiency and are preserved by the mean.

It is not only that the coming to be, growth, and destruction of the virtues result from the same things and are caused by the same things, however, but also that their activities are found in the same ones; for this holds in the other more evident cases as well—for example, in that of strength; for strength comes about from taking much nourishment and enduring much exertion, and it is a strong person who is most capable of doing these very things.

It is also that way in the case of the virtues; for from abstaining from pleasures we become temperate and, having become so, are most capable of abstaining from them. It is the same way in the case of courage; for if we are habituated to despise frightening things and to endure them, we become courageous and, having become so, are most capable of enduring frightening things.

20. 1094b11–22.

2.3
Pleasure and Pain

We must take the pleasures and pains that supervene on a person's works as a sign of his states; for the one who abstains from bodily pleasures and enjoys doing just this is temperate, while the one who is annoyed is intemperate, and the one who endures terrible things and enjoys doing so—or at least is not pained by it—is courageous, while the one who is pained is cowardly. For virtue of character is concerned with pleasures and pains; for it is because of pleasure that we do base actions and because of pain that we abstain from doing noble ones. That is why we must be brought up in a certain way straight from childhood, as Plato says,[21] so as to enjoy and be pained by the things one should; for the correct education is just that.

Further, the virtues are concerned with actions and feelings, and every feeling and every action are accompanied by pleasure and pain. That is also why virtue is concerned with pleasures and pains. Punishments also reveal this, since they take place by means of pleasure and pain; for punishments are medical treatments of a sort, and medical treatments are naturally effected by means of contraries.

Further, as we said[22] just now, of every state of soul the following holds true: the sorts of things that by nature cause it to become worse or better are the ones it is by nature related to and the ones it is concerned with. Again, it is because of pleasures and pains that people become base—by pursuing and avoiding these, either the ones one should not or when one should not or in the way one should not or in whatever other ways are distinguished in the account. That is also why people define the virtues as a sort of absence of feeling or a sort of being at rest. But they do not define them well if they say this unconditionally and do not add as one should or as one shouldn't, and all the other specifications.

It is assumed, therefore, that virtue is the sort of state concerned with pleasures and pains that is a doer of the best actions, and that vice is the contrary state.

It would become evident to us from the following considerations too that virtue and vice are concerned with the same things. For there are three objects of choice and three of avoidance: the noble, the advantageous, and the pleasant, and their contraries, the shameful, the harmful, and the painful. Concerning all these, the good person tends to be correct and the bad one to err—most of all, though, concerning pleasure; for it is both shared with animals and entailed by every object of choice; for what is noble or what is advantageous appears pleasant too.

Further, pleasure has grown up with all of us from infancy. That is why it is difficult to rub out this feeling that is dyed into our lives. Also, we measure our actions, some more and others less, by the standard of pleasure and pain. That is why, then, **1105^{a}1**

21. *Laws* 653a–c.
22. 1104^{a}27–^{b}3.

our entire study must be concerned with these, since whether someone enjoys or is pained well or badly has no small impact on his actions.

Further, it is more difficult to fight against pleasure than to fight against spirit, just as Heraclitus says,[23] and both craft and virtue are always concerned with what is more difficult; for to do well what is more difficult is in fact a better thing. So that is also why our entire study, both as a contribution to virtue and as a contribution to politics, must be concerned with pleasures and pains; for the one who uses these well will be good and the one who uses them badly will be bad.

Let us say, then, that virtue is concerned with pleasures and pains, that the things from which it comes about are also the ones by which it is increased and (if they come about differently) destroyed, and that the things from which it has come about are also the ones concerning which it is active.

2.4
Action and Character

Someone might raise a puzzle, however, about how we can claim that people must do just actions to become just, and temperate ones to become temperate; for if people are doing what is just or temperate, they are already just and temperate, in the same way that if they are doing what is grammatical or musical, they already know grammar or music.

Or does that not hold in the case of the crafts either? For it is possible to produce something grammatical either by luck or on someone else's instruction. Someone would be a grammarian, then, if he produced something grammatical, and produced it as a grammarian would. And this is to do it in accord with the craft knowledge of grammar that is internal to himself.

Further, the case of crafts is not similar to that of virtues; for the things that come about by means of the crafts have their goodness internal to them, and thus it is enough if they come about in such a way as to be in a certain state. The things that come about in accord with the virtues, by contrast, are done justly or temperately not simply if they are in a certain state but if the one who does them is also in a certain state. First, if he does them knowingly; second, if he deliberately chooses them and deliberately chooses them because of themselves; and third, if he does them from a stable and unchangeable state.

1105b1 As regards the various crafts, these factors do not count, except for the knowing itself. As regards the virtues, however, knowing has little or no strength, while the other factors have not just a little but all the significance, and these are the very ones that come about from frequently doing just and temperate actions.

23. Perhaps at B85 DK.

Actions are said to be just and temperate, then, when they are the sort that a just or temperate person would do, while a just or temperate person is not the one who does these actions but the one who, in addition, does them in the way a just or temperate person does them. So it is correct to say that the just person comes about from doing just actions, and the temperate person from doing temperate ones, and that from not doing them no one could have even the prospect of becoming good.

Ordinary people, however, do not do these actions but, taking refuge in argument, think that they are doing philosophy and that this is the way to become excellent—thus behaving a bit like sick people who listen carefully to doctors but do none of the things that are prescribed. So just as people who take care of themselves in that way will not have a body that is in a good state, people who do philosophy in a similar way will not have souls that are in a good one either.

2.5
Virtue of Character Defined (1)

Next, we must investigate what virtue is. Since, then, the things that come about in the soul are three, feelings, capacities, and states, virtue would be one of these.

By "feelings" I mean appetite, anger, fear, confidence, envy, enjoyment, love, hatred, longing, jealousy, pity, and, in general, whatever is accompanied by pleasure and pain. By "capacities" I mean things due to which we are said to be capable of these feelings—for example, due to which we are capable of feeling anger, fear,[24] or pity. By "states" I mean the things due to which we are well or badly off in relation to feelings—for example, in relation to anger, if we feel it too intensely or too weakly, we are in a bad state; but if to a mean degree, we are in a good one; and similarly in relation to the others.

Virtues and vices are not feelings, then, because we are not called "excellent" or "base" on account of our feelings, while we are so called on account of our virtues and vices. Nor are we praised or blamed on account of our feelings (for it is not the person who fears or gets angry who is praised nor the person who simply gets angry who is blamed but the one who gets angry in a certain way). But we are praised or blamed on account of our virtues and vices. **1106^{a}1**

Further, we become angry or feel fear without deliberate choice, while the virtues are deliberate choices of a sort—or, rather, are not without deliberate choice. In addition, we are said to be moved in accord with our feelings, but in accord with our virtues and vices we are not said to be moved, but to be disposed in a certain way.

Because of these things virtues are not capacities either; for we are not called "good" for having the capacity simply to feel things, nor are we called "bad," nor are

24. Reading φοβηθῆναι.

we praised or blamed. Further, we have the capacities by nature, while we do not become good or bad by nature—we spoke about this earlier.[25]

If, then, the virtues are neither feelings nor capacities, it remains for them to be states. We have now said what the kind of thing virtue is.

2.6
Virtue of Character Defined (2)

We must not say only that virtue is a state, however, but also what sort of state it is.

We must say, then, that every virtue, regardless of what thing it is the virtue of, both completes the good state of that thing and makes it do its work well—as, for example, the virtue of an eye makes both the eye and its work excellent; for it is due to the eye's virtue that we see well. Similarly the virtue of a horse makes the horse excellent—that is, good at running, carrying its rider, and standing firm against enemies. If, then, this holds in every case, the virtue of a human being would also be the state due to which he becomes a good human being and will do his own work well. How that will come about, we have already said.[26] But it will also become evident if we get a theoretical grasp on the sort of nature that virtue has.

In everything continuous and divisible, then, it is possible to take more, less, and equal, and these either in relation to the thing itself or in relation to us—where equal is some sort of mean between excess and deficiency. By "the mean in relation to the thing" I mean what is equidistant from each of its two extremes, which is precisely one in number and the same for all. The mean in relation to us, by contrast, is what takes neither too much nor too little. It is not one thing and is not the same for all. For example, if ten are many and two are few, we take six as the mean in relation to the thing; for it exceeds and is exceeded by an equal amount. That is the mean in accord with arithmetical proportion. But the mean in relation to us must not be ascertained in that way; for if ten minas is a lot to eat and two minas a little, the
1106b1 trainer will not prescribe six minas; for that is presumably also a lot or a little for the person who is to eat it—a little for Milo but a lot for the one starting his athletic training regimen. It is the same way in the cases of running and wrestling. In this way, then, everyone with scientific knowledge avoids excess and deficiency and looks for the mean and chooses it—the mean not in the thing but in relation to us.

If, then, every science does complete its work well in this way, looking to the mean and bringing its works into conformity with it—which is why people regularly say of works that are well made that nothing could be taken away or added (for excess and deficiency destroy what is well done, while the mean preserves what is well done, and good craftsmen, as we say, complete their works by looking to the mean), and if

25. 1103a18–26.
26. Most recently at 1104a11–27.

virtue is more exact and better than any craft, just as nature also is, it would be able to aim at and hit the mean.

I am speaking of virtue of character; for it is concerned with feelings and actions, and it is in these that there is excess, deficiency, and the mean. For example, it is possible to feel fear and confidence, appetite, anger, pity, and pleasure and pain generally, both too much and too little, and in both ways not well.

To feel such things when one should about the things one should, in relation to the people one should, for the sake of what one should, and as one should is the mean and best, and precisely this is characteristic of virtue.

Similarly with actions, there is excess, deficiency, and the mean. Virtue, for its part, is concerned with feelings and actions in which excess is in error, and deficiency subject to blame, while the mean is subject to praise and is on the correct path (and both these features are characteristic of virtue). Virtue, therefore, is a sort of mean because it is able to aim at and hit the mean.

Further, it is possible to err in many ways (for the bad belongs to what is without a limit, as the Pythagoreans portrayed it,[27] and the good to what is determinate), while there is only one way to be correct (that is why indeed erring is easy and being correct difficult, easy to miss the target, but difficult to hit it). Because of these facts too, then, excess and deficiency are characteristic of vice, while the mean is characteristic of virtue: "for people are good in one simple way, but bad in all sorts of ways."[28]

Virtue, then, is a deliberately choosing state, which is in a mean in relation to us, one defined by a reason and the one by which a practically wise person would define **1107ᵃ1** it. Also, it is a mean between two vices, one of excess and the other of deficiency. Further, it is also such a condition because some vices are deficient in relation to what the relevant feelings and actions should be and others are excessive, but virtue both finds the mean and chooses it.

That is why—as regards its substance, and the account that states its essence—virtue is a mean, but, in relation to the best and doing well, it is an extreme.

But not every action or every feeling admits of the mean; for in some cases they are named in such a way that they are united with baseness from the start—for example, rejoicing at another's doing badly, shamelessness, and envy, and (in the case of actions) adultery, theft, and murder; for all these and things like them—and not the excessive varieties of them or the deficient ones—are said to be what they are because they are base. It is never possible, then, to be correct concerning them, but it is necessary always to be in error. Nor is there a doing well or not well concerning such things (committing adultery with whom one should, when one should, in the way one should); rather, simply to do any of these things is to err.

So it is like thinking that there are also means and an excess and a deficiency where unjust, cowardly, and intemperate actions are concerned—since that way, at

27. In their column of contraries.
28. Source unknown.

any rate, there will be a mean of excess and of deficiency and an excess of excess and a deficiency of deficiency. But just as in temperance and courage there is no excess and deficiency, because of the mean being in a way an extreme, so in these other cases too there is no mean and no excess or deficiency either, but, however they are done, they are errors; for, in general, there is neither a mean of excess and deficiency nor excess and deficiency of a mean.

2.7
Individual Virtues of Character

This must not only be stated in universal terms, however, but also adapted to the particular cases. For in accounts concerned with actions, while the universal ones are common to more cases, the ones that apply to a part are truer; for actions are concerned with particulars and our account must be in harmony with them. We must get hold of these, then, from the chart.[29]

As regards feelings of fear and confidence, then, courage is the mean, while of those people who are excessive, the one who is excessive in his fearlessness is nameless (many indeed are nameless), the one who is excessive in his confidence is rash, and the one who is excessively fearful and deficient in confidence is cowardly.

As regards pleasures and pains (not all of them and even less so as regards pains), the mean is temperance and the excess is intemperance. But people deficient in pleasure are scarcely found, which is why people of that sort have not even acquired a name. Let us call them "insensitive."

As regards giving and getting wealth, the mean is generosity, while the excess and deficiency are wastefulness and ungenerosity. In the case of these states, people are excessive and deficient in contrary ways; for the wasteful person is excessive in giving wealth and deficient in getting it, while the ungenerous person is excessive in getting it but deficient in giving. (For the moment we are speaking in outline and in summary, satisfying ourselves with just this much. A more exact definition of these virtues will come later.)

In the case of wealth, there are also other dispositions: the mean is magnificence (for the magnificent person differs from the generous one; for the former is concerned with great sums, the latter with small), the excess is tastelessness and lack of refinement, and the deficiency is niggardliness. These vices differ from the ones having to do with generosity. How they differ will be discussed later.

As regards honor and dishonor, the mean is greatness of soul, while the excess is called a sort of "conceitedness," and the deficiency "smallness of soul." And just as we said generosity was related to magnificence, differing from it in being concerned with small sums, so there is also something related in this way to greatness of soul (which

29. *EE* 1220b38–1221a12.

is concerned with great honor) that is concerned with small honor; for one can desire honor as one should or more or less than one should. The person who is excessive in these desires is said to be an honor-lover, while the one who is deficient in them is indifferent to honor, and the person in a mean nameless. Also nameless are the corresponding dispositions, with the exception of that of the honor-lover, which is called "love of honor." That is why the extremes lay claim to the middle ground—that is, we sometimes say that the person in a mean is an honor-lover and sometimes that he is indifferent to honor, and sometimes we praise the honor-lover and sometimes the one who is indifferent to honor. Why we do this will be discussed in what follows.[30] **1108ᵃ1** But for now let us speak about the rest in the normal way.[31]

There is also excess, deficiency, and a mean in the case of anger, but, since these are pretty much nameless, and since the one in the mean is said to be mild-mannered, let us call the mean "mild-manneredness." Among those at the extremes, let an excessive one be irascible and his vice irascibility, and let a deficient one be a sort of spiritless person, and his vice spiritlessness.

There are also three other means that have a certain similarity to each other but differ from each other; for all of them are concerned with communal relations in words and actions; but they differ because one is concerned with the truth in them while the others are concerned with what is pleasant—in amusements, in the case of one, and in what bears on life generally, in the case of the other. Let us talk, then, about these too, in order to see more clearly that in all cases the mean is praiseworthy, while the extremes are neither praiseworthy nor correct but blameworthy. Of these, most are also nameless. But we must try, just as in the other cases, to make up names for them ourselves for the sake of perspicuity and ease in following.

As regards truth, then, let us call the person in a mean the "truthful" sort, and let us call the mean "truthfulness." Pretense that exaggerates will be boastfulness and the one who has it will be boastful. Pretense that minimizes will be self-deprecation and the one who has it will be a self-deprecator.

As regards the pleasant in amusements, the person in a mean is witty and the disposition is wit. The excess is buffoonery and the one who has it is a buffoon, while the deficient person is a sort of boor and the state boorishness. As regards the remainder of the pleasant (that in life generally), let us call "friendly" a person who is pleasant in the way one should be, and the mean friendliness. The excessive person (if he is not so for the sake of something specific) will be ingratiating or (if he is so for his own benefit) a flatterer. And the deficient person (who is unpleasant in everything) will be a quarrelsome sort of person and disagreeable.

There are also means in feelings and concerned with feelings; for shame is not a virtue, yet the person with a sense of shame is praised as well. And in these cases, in fact, one person is said to be in a mean, while another is said to be excessive (as in the

30. 1125ᵇ8–17.
31. 1107ᵇ14–15.

case of a bashful person, who is ashamed of everything). The one who is deficient in shame or who does not feel it at all is shameless. And the person in a mean is said to have a sense of shame.

Indignation is a mean between envy and rejoicing at another's doing badly, all of which are concerned with pleasure and pain at what happens to neighbors. The indignant person is pained by those who do well undeservedly. The envious person exceeds him in being pained by everyone's doing well, while the person who rejoices at another's doing badly is so deficient in being pained that he even enjoys this.

There will be an opportunity to discuss these issues later. But, as regards justice, since it is not said of things only unconditionally, we will (after that) distinguish its two varieties and say in what way each is a mean—and, similarly, as regards the virtues of reason.

2.8
Means and Extremes

There are three dispositions, then, two of which are vices (one of excess and the other of deficiency) and one a virtue (the mean), and all of them are opposed to each other in a way; for the extremes are contrary both to the mean and to each other, and the mean to the extremes; for just as the equal is greater when compared to the smaller and smaller when compared to the greater, so the mean states are excessive both in feelings and in actions when compared to the deficiencies and deficient when compared to the excesses. For the courageous person appears rash when compared to the coward and cowardly when compared to the rash one. Similarly, the temperate person appears intemperate when compared to the insensitive person and insensitive when compared to the intemperate one, and the generous person appears wasteful when compared to the ungenerous person and ungenerous when compared to the wasteful one. That is why each of the extreme people pushes the one in a mean toward the other extreme—that is to say, the coward calls the courageous person "rash" and the rash person calls him a "coward," and analogously in the other cases.

While they are opposed to each other in this way, however, the greater contrariety is that of the extremes when compared to each other rather than when compared to the mean; for they are further from each other than from the mean (as the great is further from the small and the small further from the great than either is from the equal).

Further, when compared to the mean, some extremes appear to have a certain similarity to it, as rashness does when compared to courage or wastefulness when compared to generosity. The greatest dissimilarity, however, appears to be that of the extremes when compared to each other. But things that are furthest from each other are defined as contraries, so that things that are further apart are also more contrary.

When compared to the mean, the deficiency is more opposed to it in some cases, and the excess in others. For example, it is not rashness (the excess) that is more opposed to courage but cowardice (the deficiency), while it is not insensitivity (the deficiency) but intemperance (the excess) that is more opposed to temperance.

This happens due to two causes. One derives from the thing itself; for because it is closer to the mean and more similar to it, we regard not it but its contrary as more opposed to the mean. For example, since rashness seems to be more like courage and closer to it, and cowardice less similar, we regard cowardice as more opposed; for things further from the mean seem to be more contrary to it. This, then, is one cause, deriving from the thing itself.

The other derives from ourselves; for the things that we ourselves are naturally more inclined toward are the ones that appear more contrary to the mean. For example, we are naturally more inclined toward pleasures, which is why we are more easily drawn toward intemperance than toward moderation. It is these things, then, that we say are more contrary—the ones we go more toward. That is why it is intemperance (the excess) that is more contrary to temperance.

2.9
Achieving the Mean

That virtue of character is a mean, then, and in what way, that it is a mean between two vices (one of excess and the other of deficiency), and that it is such because it is able to aim at and hit the mean both in feelings and in actions, has been adequately stated.

And that is why it takes work to be excellent. For in each case it takes work to find the mean (*meson*)—for example, not everyone can find the midpoint (*meson*) of a circle, but the one with knowledge. In the same way, getting angry is also something everyone can do and something easy, as is giving or spending money. But determining who to give it to, how much, when, for the sake of what, and in what way—that is no longer something everyone can do or something easy. That is why doing it well is a rare thing and a praiseworthy and noble one.

That is why a person who is aiming to hit the mean must first steer clear of what is more contrary to it, as Calypso too advises: "from that surge and spray keep your ship well clear."[32] For one of the extremes is more in error, the other less. Since, then, it is extremely difficult to hit the mean, the second-best course, as they say, is to ascertain the lesser of the evils, and that will best be done in the way we say.

We must also investigate what we ourselves are more inclined toward; for different people are naturally inclined toward different things. This will become known to us from the pleasure and pain that the things bring about in us. And it is in the contrary

32. Homer, *Odyssey* 12.219–220. Circe, not Calypso, gives this advice.

direction that we must drag ourselves off; for it is by pulling well away from error that we will attain the mean—precisely as people do in rectifying distorted pieces of wood.

In everything, we must most of all guard against the pleasant—that is, pleasure; for we are not unbiased judges of it. Precisely the way, then, that the elders of the people felt about Helen,[33] that is the way we ourselves should feel about pleasure, and on each occasion we should repeat what they uttered; for that way we will send it off and be less in error.

To sum up, then, if we do these things, we will be most able to hit the mean. But presumably it is difficult to hit it, most of all in the realm of particulars; for it is not easy to define how, with whom, about what, or for how long a time one should be angry; for sometimes indeed we ourselves praise people who are deficient in anger, saying that they are mild-mannered, and sometimes those who are harsh, calling them "manly."

It is not the person who deviates a little—whether toward excess or toward deficiency—who is blamed, however, but one who does so a lot; for someone like that does not escape notice. But up to what point and to what extent one's deviation is blameworthy is not easy to define in an account—nor indeed is anything else among perceptibles. Such things lie in the particulars, and their discernment in perception.

This much, therefore, makes clear that the mean state is praiseworthy in all cases but that we should sometimes incline toward excess and sometimes toward deficiency; for that way we will most easily hit the mean and do well.

BOOK 3

3.1
Voluntary and Involuntary Action

Since virtue is concerned with feelings and actions, then, and it is the voluntary ones that are praised and blamed, while the involuntary ones elicit sympathetic consideration and are sometimes even pitied, it is perhaps necessary for those who are investigating issues relating to virtue to make some determinations about the voluntary and the involuntary. This is also useful to legislators regarding honors and punishments.

The involuntary seems to be what comes about by force or because of ignorance. **1110a1** Also, what is forced is what has a starting-point that comes from outside, that is, the sort of starting-point where the agent, or the one being affected, contributes nothing—as, for example, if the wind or human beings with control over him took him off somewhere.

33. Homer, *Iliad* 3.156–160.

Actions done because of fear of greater evils or because of something noble—for example, if a tyrant with control over one's parents and children ordered one to do something shameful and, if one does it, they would be saved, while, if one does not do it, they would be put to death—give rise to disputes about whether the actions are involuntary or voluntary.

The same sort of dispute also arises about cases of throwing cargo overboard in a storm; for no one simply throws it overboard voluntarily, but to preserve himself and all the rest, anyone with understanding does do it.

These sorts of actions are mixed, then, although they more closely resemble voluntary ones; for they are choiceworthy at the time when they are done, and the end of the actions is in accord with the opportune moment. Both voluntary and involuntary, then, must be ascribed with reference to the time at which the agent does these actions. And the agent does do them voluntarily; for in fact the starting-point of his moving his instrumental parts in actions of this sort is internal to himself, and—because the starting-point is internal to himself—it is also up to him whether to do them or not. Such actions, then, are voluntary. Unconditionally, though, they are presumably involuntary; for no one would choose anything of this sort for what it intrinsically is.

People are sometimes even praised for actions of this sort, when they endure something shameful or painful in exchange for great and noble things, while if it is the reverse, they are blamed; for to endure the most shameful things for something not at all noble or only moderately so is characteristic of the base person. And in some cases it is not praise we give but sympathetic consideration, when someone does some action one should not do because of things that overstrain human nature and that no one could endure.

In some cases, however, there is presumably no being compelled. On the contrary, rather than do them one should die having suffered the most terrible things; for in fact the things that compelled Euripides' Alcmaeon to kill his mother are manifestly ridiculous.[34]

But it is sometimes difficult to distinguish what must be chosen in exchange for what or what must be endured in exchange for what, and more difficult still to stand by what we have determined; for, as the expected consequences are for the most part painful, what we are compelled to do is shameful. That is what leads people to give praise or blame to those who are compelled or not compelled.

What sorts of things, then, must we say are forced? Or is it that things are unconditionally forced when their cause lies in external factors and the agent contributes nothing? But the ones that are intrinsically involuntary, though choiceworthy on this occasion in exchange for these things, and where the starting-point is internal to the agent—these, though intrinsically involuntary, are, on this occasion and done in exchange for these things, voluntary. But they more closely resemble voluntary **$1110^{b}1$**

34. Aristotle refers to the lost *Alcmaeon* from which he quotes at $1136^{b}13$–14.

ones; for the actions lie in the particulars and these particular actions are voluntary. But what sorts of things must be chosen in exchange for what is not easy to give an account of, since there are many differences in the particulars.

If someone were to say that pleasant things and noble things force us (for they are external and compel us), then for him everything would be forced; for everyone does every action for the sake of these. Moreover, people who are forced to act and act involuntarily find it painful, while those who act because of the pleasant or the noble do it with pleasure. It is ridiculous, then,[35] for the agent to hold external things responsible but not himself for being easily ensnared by such things, and to hold himself responsible for his noble actions but pleasant things responsible for his shameful ones.

What comes about by force, then, seems to be that whose starting-point is external, nothing being contributed by the one who is forced.

All of what is done because of ignorance, however, is not voluntary, although it is contra-voluntary when involving pain and regret; for the person who has done whatever it is because of ignorance, but sees nothing repulsive in his action, has not acted voluntarily, because he did not know what he was doing. But neither has he acted contra-voluntarily, because he is not pained by it. Among those people, then, who act because of ignorance, the one who regrets what he did seems a contra-voluntary agent. The one who does not regret, since he is a different case, let him be a "non-voluntary" agent; for since he is different, it is better for him to have a special name.

Acting because of ignorance, however, seems to be different from acting in ignorance; for the person who is drunk or angry does not seem to act because of ignorance but because of one of the conditions mentioned, although he does not act knowingly but in ignorance. But every depraved person is ignorant of the things one should do and the things one should abstain from, and it is because of this sort of error that unjust people—and bad people generally—come about.

But a case is not meant to be called "involuntary" if someone is ignorant of what things are advantageous; for ignorance in our deliberate choice is not a cause of something's being involuntary but of depravity, and ignorance of the universal (for people are blamed for ignorance of this sort) is not a cause either, but ignorance of the particulars in which the action lies and with which it is concerned; for in these lie the basis for both pity and sympathetic consideration; for it is the person who is ignorant of one of these particulars who acts involuntarily.

Perhaps it is not a bad thing, then, to make some determinations about these, what they are and how many they are. When someone acts, then, we can ask, who? what? concerning what? or, in what? and sometimes, with what? (for example, with what instrument?), for the sake of what? (for example, preservation), and, in what way? (for example, weakly or intensely).

35. Reading δὴ.

No one who is not a madman could be ignorant about all of these or, clearly, about who is doing the action; for how could he be ignorant about himself? But about what he is doing, he might be ignorant, as when people say that things just slipped out while they were talking or that they didn't know they were a secret, as Aeschylus said about the Mysteries or that they wished to do a demonstration and it went off, as the man said about the catapult. Or someone might think that her son was the enemy, as Merope did,[36] or that a spear had a guard on the point or that the stone was pumice stone or he might give someone a drink with a view to preserving his life but end up killing him or mean to give someone a light tap (as sparring partners do) and knock him out.

Since about all these things ignorance is possible and these are the ones in which the action lies, the person who is ignorant of one of them seems to have acted involuntarily—most of all so if he is ignorant of the ones with the most control. And the ones with the most control seem to be the ones in which the action lies and what it is for the sake of. What is called "involuntary" on the basis of this sort of ignorance, then, must also cause pain and regret.

Because the involuntary consists, then, of what comes about by force or because of ignorance, the voluntary would seem to be what has its starting-point in the agent himself, when he knows the particulars in which the action lies.

For actions done because of spirit or appetite are presumably not correctly said to be involuntary. For, first of all, none of the other animals will then act voluntarily and neither will children. Second, are none of the actions we do because of appetite or spirit done voluntarily, or are the noble ones voluntary and the shameful ones involuntary? Or is that certainly ridiculous, since they have a single cause? But presumably it is strange to call the things we should desire "involuntary." And one should be angry at certain things and have an appetite for certain things—for example, health and learning. It also seems that involuntary things are painful, while those in accord with appetite are pleasant.

Further, what difference in involuntariness is there between errors made on the basis of rational calculation and those made on the basis of spirit? Both indeed are to be avoided. But the non-rational feelings seem to be no less human, so that actions resulting from spirit and appetite are no less the actions of human beings. It would be strange, then, to count them as involuntary. **1111**[b]**1**

3.2
Deliberate Choice

Now that we have made these determinations about the voluntary and the involuntary, the next task is to discuss deliberate choice; for it seems to belong most properly to virtue and to better distinguish people's characters than their actions do.

36. In Euripides' lost play *Cresphontes* (*Po*. 1454[a]5–7).

Deliberate choice, then, is apparently something voluntary, although not the same as the voluntary (which extends more broadly); for children and other animals share in the voluntary but not in deliberate choice, and sudden actions are voluntary, we say, but are not in accord with deliberate choice.

Those who say[37] that deliberate choice is appetite, spirit, wish, or some sort of belief do not seem to be correct. For deliberate choice is not something shared by non-rational creatures, while appetite and spirit are. Also, a person who lacks self-control acts from appetite but not from deliberate choice, while a person who has self-control does the reverse, acting from deliberate choice but not from appetite. Also, appetite is contrary to deliberate choice but not to appetite. Also, appetite is concerned with the pleasant and the painful, while deliberate choice is concerned neither with the painful nor with the pleasant. Still less is deliberate choice spirit; for actions done because of spirit seem least of all to be in accord with deliberate choice.

Then again, it is not wish either, although it appears to be a close relative of it; for there is no deliberate choice of impossible things, and if someone were to say he was deliberately choosing them, he would seem silly. But there is wish[38] for impossible things—for example, immortality. There is also wish concerning the sorts of things that could never come about through ourselves—for example, that a certain actor or athlete win a victory prize. No one, however, deliberately chooses things like that, but things he thinks can come about through him. Further, wish is more for the end, while deliberate choice is of the things that further the end. We wish to be healthy, for example, but we deliberately choose the things through which we will be healthy. We wish to be happy too, and say so, while it is not fitting to say that we deliberately choose to be happy; for deliberate choice in general seems to be concerned with what is up to us.

Neither, then, would it seem to be belief; for belief seems to be concerned with all things and no less concerned with eternal ones and impossible ones than with ones that are up to us. And beliefs are divided into false and true, not into bad and good, while deliberate choices are more divided into bad and good.

Presumably no one does claim that deliberate choice is the same as belief in general, but neither is it the same as a specific sort of belief; for it is by deliberately choosing good things or bad things that we are people of a certain sort, not by believing them. Also, we deliberately choose to take or avoid some such thing, while we have beliefs about what it is or to whose advantage it is or in what way. But whether to take it or avoid it is scarcely something we hold a belief about. Also, deliberate choice is praised more for being of what it should be of, or for correctness in this sense, while belief is praised for being true. Also, we deliberately choose things that we most know to be good, while we have beliefs about things we scarcely know to be good. Also, the people who make the best deliberate choices do not seem to be the same as the ones who

37. Reference unclear.

38. Rejecting the addition of καὶ.

form the best beliefs, on the contrary, some people form better beliefs but because of vice choose what one shouldn't. Whether there is belief preceding deliberate choice, or following it, makes no difference; for it is not this we are investigating but whether deliberate choice is the same as a specific sort of belief.

What, then, or what sort of thing, is deliberate choice, since it is none of the ones we mentioned? To be sure, it is something voluntary, apparently, although not everything voluntary is deliberately chosen. But is it something reached by prior deliberation at least? For deliberate choice involves reason and thought, and even its name (*prohairesis*) seems to signify something's being worthy of choice (*haireton*) before (*pro*) other things.

3.3
Deliberation

Do people deliberate about everything, and is everything an object of deliberation, or are there some things about which there is no deliberation? And presumably one must call an "object of deliberation" not what a silly sort of person or a madman would deliberate about but what a person with understanding would.

No one deliberates about eternal things, then, about the universe, for example, or about the fact that the diameter and sides of a square are not proportional; or about things that include change but that always come about in the same way, whether from necessity (or indeed by nature) or due to some other cause, such as the solstices or the risings of the heavenly bodies; or about things that happen sometimes in one way, sometimes in another, such as droughts and rains; or about things that come about by luck, such as discovering a treasure; or about all human affairs either—for example, no Spartan deliberates about the best constitution for the Scythians; for none of these things comes about through ourselves.

We do deliberate, though, about things that are up to us and doable in action, and these in fact are the remaining ones. For the causes of things seem to be nature, necessity, luck, and further, understanding and everything that comes about through a human being. Among human beings, however, each group deliberates about what is doable in action through itself.

There is no deliberation, however, about sciences that are both exact and self-sufficient—about orthography, for example, since we have no hesitation about what way to write the letters. We do deliberate, however, about those things that come about through ourselves but not always in the same way (for example, about the things that medicine or moneymaking deals with). And we deliberate more about navigation than about athletic training, insofar as navigation has been less exactly worked out. Further, deliberation is involved in a similar way about the rest, but more about crafts than about sciences, for we are more hesitant about them.

Deliberation is found, then, in the sphere of what holds for the most part but where it is unclear what way things will turn out and where there is an element of indefinability. And we call on partners in deliberation on important questions, when we mistrust ourselves as not being adequate to determine the answer.

We deliberate not about ends, but about the things that further ends. For a doctor does not deliberate about whether to cure or an orator about whether to persuade or a politician about whether to produce good legislative order, nor do any of the rest deliberate about their end. Rather, they take the end for granted and investigate in what way and through which things it will come about. And if it appears that it can come about through several, they investigate through which ones it will most easily and best come about. But if it is brought to completion through only one, they investigate in what way it will come about through this and through which things it, in turn, will come about, until they arrive at the first cause, which is the last thing in the process of discovery. For a deliberator seems to inquire and analyze in the way we said just as though he were dealing with a diagram—but while it is evident that not all inquiry is deliberation (for example, mathematical inquiry), all deliberation is inquiry, and the last thing found in the analysis seems to come first in bringing about the result.

Also, if people encounter something impossible, they give up (for example, if wealth is needed but there is no way to provide it), while if it appears possible, they set about doing the action. But possible things are those that could come about through ourselves; for what comes about through our friends comes about through ourselves in a way, since the starting-point is in us.

We inquire sometimes about instruments, sometimes about what way they are to be used, and similarly for the rest—sometimes through whom, sometimes in what way, and sometimes through which things.

It seems, then, as we said,[39] that a human being is a starting-point of actions and that deliberation is about what is doable in action by him, while the actions are for the sake of other things. For what is deliberated about is not the end but the things that further ends, and neither, of course, is it particulars (for example, whether this thing is a loaf or whether it is cooked in the way it should be); for these are matters for perception. And if we deliberate at every point, we will go on without limit.

Objects of deliberation and objects of deliberate choice are the same, except that objects of deliberate choice are already something determinate; for it is what has been judged as a result of deliberation that is an object of deliberate choice. For each of us stops inquiring about what way to act when he brings back the starting-point to himself and, within himself, to the leading element, since this is what deliberately chooses. This is also clear from the ancient constitutions that Homer described; for it is what kings had deliberately chosen that they announced to the common people.

Since an object of deliberate choice is an object of deliberation and of desire that is among the things that are up to us, deliberate choice too would be a deliberative

39. 1112b28.

desire of things that are up to us; for having judged as a result of deliberation, we desire in accord with our deliberation.

So much, then, by way of an outline of deliberate choice, of the things it is concerned with, and that it is about the things that further ends.

3.4
Wish

Wish is for the end, as we said,[40] but some people think it is for the good, others that it is for the apparent good.

But for those who say that the object of wish is the good, it follows that when someone who has not chosen correctly wishes for something, what he wishes for is not an object of wish at all (for if it is an object of wish, it will also be a good thing, but, as it happens, it was a bad one).

But for those who say that the object of wish is the apparent good, it follows that nothing is by nature an object of wish, but what seems good to each person is so, with different things—even contrary ones, as it happens—appearing so to different ones.

If, then, these results do not satisfy us, must one therefore say that unconditionally and in truth the object of wish is the good, but to each person it is the apparent good? To the excellent person, it is what is truly the object of wish; to a base one, it is whatever random thing it happens to be. It is just the same in the case of bodies. The things that are healthy for those with good dispositions are the ones that are truly healthy, while for those that are diseased, it is different ones, and similarly with bitter, sweet, hot, heavy, and each of the others; for the excellent person judges each of them correctly and in each case, what is true is apparent to him.

For each state has its own special set of things that are pleasant or noble, and the excellent person is perhaps distinguished most by his seeing what is true in each case, since he is like a standard and measure of them. In the case of ordinary people, however, deception seems to come about because of pleasure, which appears to be a good thing when it is not. They choose the pleasant, then, as good and avoid the painful as bad. **1113b1**

3.5
Character and End

Since, then, wish is for the end, and the objects of deliberation and of deliberate choice are things that further the end, actions concerned with these would be in accord with deliberate choice and voluntary. Also, the activities of the virtues are concerned with these things.

40. 1111b26.

Virtue too is up to us, then, and, similarly, vice; for where acting is up to us, so is not acting. And where to not act [is up to us], also to not act [is up to us], so that if acting, when it is noble, is up to us, not acting, when it is shameful, will also be up to us. And if not acting, when it is noble, is up to us, acting, when it is shameful, will also be up to us. But if doing noble actions or doing shameful ones is up to us and, similarly, also not doing them (which was what being good people and being bad people consisted in), then being decent or base will be up to us.

To say that no one is voluntarily wicked or involuntarily blessed seems to be partly false and partly true; for, while no one is involuntarily blessed, depravity is a voluntary thing.

Or must we dispute what has been said[41] just now and say that a human being is not a starting-point or begetter of his actions as of his children? But if what we have said does appear to be the case and we cannot refer our actions back to any starting-points beyond the ones in us, then, since they are indeed things that have their starting-points in us, they themselves are also up to us and voluntary.

The behavior of private individuals and of legislators themselves seems to testify to this; for they punish and take revenge on anyone who does a depraved action, provided it was not forced or done because of ignorance for which he himself was not responsible, while they honor anyone who does noble actions, on the supposition that this will encourage the one and prevent the other. And further, no one encourages us to do actions that are neither up to us nor voluntary, on the supposition that for us to be persuaded not to feel hot, suffer, feel hungry, or anything of this sort is pointless; for being persuaded will not make us feel these things any less. For they also punish someone for ignorance itself, if he seems to be responsible for the ignorance—as, for example, when penalties are doubled in cases of drunkenness; for the starting-point is in the agent; for not to get drunk was in his control and that was what was responsible for his ignorance. Also, they punish someone for ignorance of things in the laws that one should have scientific knowledge of and that are not
1114a1 difficult, and similarly in other cases where someone seems to be ignorant because of neglectfulness, on the supposition that it is up to him not to be ignorant; for to take care was in his control.

Presumably, though, he is the sort of person not to take care. But people are themselves responsible for becoming like that because of living in a loose way, and for being unjust or intemperate because of malice or because of spending their time drinking and the like; for it is the activities in each case that produce people of the corresponding character. This is clear from those who practice for any sort of competition or action, since they practice the relevant activity continually. To be ignorant, then, that in each case it is from engaging in the activity that the corresponding state comes about is characteristic of an altogether insensitive person.

41. 1112b31–32, explained 1113a5–7.

Further, it is unreasonable to suppose that the person who is acting unjustly does not wish to be unjust or that someone doing intemperate actions does not wish to be intemperate. But if someone non-ignorantly does the actions that would result in his being unjust, he will be voluntarily unjust. This does not mean that if he wishes, he will stop being unjust and will be just instead. For the diseased person will not be healthy that way either, even if, as it happens, he is diseased voluntarily because of living a life that lacks self-control and disobeying his doctors. At one time, certainly, it was possible for him not to be sick. Once he has let himself go, however, it is no longer possible, just as when someone has let a stone go it is no longer possible for him to get it back. Nonetheless, throwing it was up to him; for the starting-point was in him. In the same way, it was possible at the start for the unjust and the intemperate person not to become like that, which is why such people are voluntarily unjust and intemperate. But once they have become like that, it is no longer possible not to be.

It is not only vices of the soul that are voluntary, but in some cases vices of the body are as well—these being the ones that we also admonish; for no one admonishes people who are by nature ugly, but those who are so because of lack of athletic training or neglectfulness. It is the same way in the case of those who are weak or disabled; for no one would admonish someone who was by nature blind or blind as the result of a disease or as the result of a blow but would rather pity them, while those who are so as a result of drunkenness or of other sorts of intemperance everyone would admonish. Among the vices of the body, then, it is the ones that are up to us that are admonished, while those that are not up to us are not. And if that is so, then also in other cases the vices that are admonished would be the ones that are up to us.

Suppose that someone were to say that everyone aims at the apparent good but that we do not control its appearance. Instead, whatever sort of person each of us happens to be also determines the sort of end that appears to him. But if each individual is somehow responsible for his own state [of character], he is also somehow responsible for the appearance in question. If not, no one is responsible for his own malice but does these things because of ignorance of the end, thinking that because of doing them he will achieve what is best for him. His seeking of the end in question is not self-chosen; rather, we must be born possessed of a sort of sight by which to discern correctly and choose what is truly good, and a person in whom this by nature operates correctly is naturally well-disposed; for this is what is greatest and noblest and is not the sort of thing we can get from someone else or learn but the sort of thing whose condition at birth is the one in which it will later be possessed and, when it is naturally such as to be in a good and noble condition, would be the naturally good disposition of the complete and true sort.

If all this is true, then, how will virtue be any more voluntary than vice? For to both the good and the bad alike the end appears—or is determined by nature or by whatever it is—and whatever other actions they do, they do with reference to that end. If it is not by nature, then, that the end appears to each person in whatever way it does, but there is also something contributed by the person himself or, if the end is

something natural, but the excellent person's virtue is voluntary because he does the rest of the actions voluntarily, vice would be no less voluntary than virtue. Similarly, in the case of the bad person there is something that comes about in his actions through himself, even if not in his end. If, then, as is said, the virtues are voluntary (for we are in a way ourselves contributing causes of our states, and it is by being people of a certain sort that we suppose the end to be so-and-so), the vices would also be voluntary; for the two are alike.

We have now discussed in outline the virtues collectively and their kind, saying that they are means and states, that the sorts of things they arise from are the very sorts virtues lead us to do in accord with themselves, and that they are up to us and voluntary and such as correct reason prescribes.

But actions and states are not voluntary in the same way; for we control our actions from their starting-point up to their end because we know the particulars. With states, however, we control their starting-point, but the particulars of their **1115a1** development are not known to us any more than with diseases. But because it was up to us to use the states in a given way or not in that way, they are voluntary.

Let us resume and, as regards each particular virtue, say what it is, what it is concerned with, and in what way. It will be clear at the same time how many they are.

3.6
Courage (1)

First, let us discuss courage. That there is a mean concerned with feelings of fear and confidence is something that has already become evident. It is clear too that what we fear are frightening things and that these—unconditionally speaking—are bad things. That is why people define fear as expectation of what is bad.

We certainly do fear all bad things (for example, disrepute, poverty, disease, friendlessness, and death) but they do not all seem to concern the courageous person; for there are some that one should in fact fear, where fearing is noble and not fearing shameful—for example, disrepute; for a person who fears this is decent and has a sense of shame, while one who does not fear it is shameless. But some do say that such a person is courageous, by extension of the term; for he has some similarity to the courageous person; for the courageous person is also in a way fearless.

Poverty, however, is presumably something one should not fear; neither is disease nor, in general, things that are not the results of vice or of ourselves. But the person who is fearless where they are concerned is not courageous either, although he too is called so by similarity; for some people who are cowards when facing the dangers of warfare are generous and face the loss of wealth with good confidence.

Neither, then, is someone cowardly if he fears wanton aggression against his children or wife or if he fears envy or anything like that. Nor is he courageous if he is confident when he is about to be flogged.

What sorts of frightening things, then, is the courageous person concerned with? Or isn't it with the greatest ones? For no one is better at enduring frightening things. And the most frightening one is death; for it is a boundary point and for the dead person it seems that nothing is any longer either good or bad.

But the courageous person would not seem to be concerned with death in all circumstances either—for example, on the sea or in sickness. In what sorts, then? Or isn't it in the noblest ones? And deaths that occur in war are of that sort; for they occur in the face of the greatest and noblest danger, and this fits with the honors awarded in cities and by monarchs.

The person who is said to be courageous in the strict sense, then, is the one who is unanxious about noble death and the things that are an imminent threat of death; and the things that occur in war are most of all of this sort.

On the sea too, of course, and in facing diseases, the courageous person is unanxious, but not in the way that seamen are; for while courageous people have despaired of preserving their life and are repelled by a death of this sort, seamen remain optimistic in keeping with their experience. At the same time, people also show courage in circumstances in which a display of prowess is possible or in which it is noble to die, and neither holds in destructive cases of this sort.

3.7
Courage (2)

What is frightening is not the same for everyone, but some sorts of things, we say, are actually beyond the human level. These, then, are frightening to everyone—at any rate, to everyone with understanding. And those that are frightening on the human level differ in magnitude, that is, some are more frightening, some less, and similarly with things that inspire confidence.

The courageous person, however, is as undaunted as a human being can be. Though he will also fear such things, then, he will endure them in the way one should, in the way reason abides, and for the sake of the noble; for this is the end characteristic of virtue.

It is possible to fear these frightening things more, or less. Further, it is also possible to fear things that are not frightening as if they were. And of the ways error comes about, one is that one fears what one shouldn't, another is that one does so in the way one shouldn't, or when one shouldn't, or something else of that sort. It is the same way with the things that inspire confidence.

The person is courageous, then, who endures and fears the things one should, for the sake of what one should, in the way one should, when one should, and is similarly confident; for the courageous person feels and acts as things merit and in the way reason prescribes.

But the end of every activity is what is in accord with the corresponding state. This also holds, then, for the courageous person. But courage is something noble.[42] The corresponding end, then, is also such; for each thing is defined by its end. It is for the sake of what is noble, then, that the courageous person endures things and does the actions that are in accord with courage.

Among those who go to excess, the one who is excessive in his fearlessness is nameless (we said earlier[43] that many are nameless) but would be some sort of madman or insensitive to suffering if he feared nothing—"neither earthquake nor waves,"[44] as they say of the Celts. But the one who is excessively confident concerning frightening things is rash.

The rash person also seems to be a boaster and a pretender to courage. At any rate, the way that the courageous person is concerned with frightening things is the way a rash person wishes to appear to be concerned with them; and thus he imitates the courageous person in those situations where he is able. That is why most rash people are actually rash cowards; for, while they are rash in such situations, they do not endure frightening things.

The excessively fearful person, on the other hand, is a coward; for in fact he fears the things one shouldn't, in the way one shouldn't, and all the other things of that sort follow in his case. He is also deficient in confidence; but his being a coward is more
1116a1 obvious in his being excessive in the pains he feels.

The coward, then, is in a way despondent; for he fears everything. And a courageous person is the contrary way; for to be confident is characteristic of an optimistic person.

So the coward, the rash person, and the courageous person are all concerned with the same things but have states that are differently related to them; for the others are excessive and deficient, but the courageous person has the mean state, and is as one should be. Rash people are also impetuous and wish for dangers ahead of time but shrink from them when in their midst, while courageous people are quick spirited when there are things to be accomplished but at peace beforehand.

As we said, then, courage is a mean concerned with things that inspire confidence and fear in the circumstances we have described, and courage makes choices and endures things because it is noble to do so or shameful not to. Also, dying to avoid poverty, sexual desire, or something painful is the mark not of a courageous person, but rather of a coward; for to flee from painful labors is characteristic of softness, and someone like that faces up to death not because it is noble but because he is fleeing something bad.

42. Reading καὶ τῷ ἀνδρείῳ δή. ἡ <δ'> ἀνδρεία καλόν.
43. 1107b1–2.
44. Apparently a quotation.

3.8
Courage-Like Conditions

Courage, then, is something of this sort. But there are other things so called, which are of five sorts. First comes political courage; for it is most like courage. For citizens seem to endure dangers because of the penalties prescribed by the laws, because of people's reproaches, and because of the honors involved. And that is why the most courageous seem to be those among whom cowards are dishonored and courageous people honored.

Homer too depicts people of this sort—for example, Diomedes and Hector: "Polydamas will be the first to heap disgrace on me," and "One day Hector will say among the Trojans, 'The son of Tydeus fleeing me'."[45] This is most similar to the sort we previously discussed,[46] in that it comes about because of virtue; for it comes about because of a sense of shame, because of a desire for something noble (for honor is that), and to avoid reproach (for reproach is shameful).

Someone might also put in the same class those who are compelled by their rulers. But these are not as good, because they do what they do not because of a sense of shame but because of fear and in order to avoid not the shameful but the painful; for the people in control compel them to do it in the way that Hector does: "If I see anyone cringing in fear far away from the battle, he will not, you can be sure, avoid being thrown to the dogs."[47] And commanders who beat people if they retreat are doing the same thing, as are those who draw up their men in front of trenches or things of that sort; for they are all exerting compulsion. One should be courageous **1116^{b}1** not because of compulsion, however, but because it is noble.

Experience in particular areas also seems to be courage, which is why Socrates too thought that courage is scientific knowledge.[48] Different sorts of people, however, have experience in different areas, but in matters of warfare, it is the professional soldiers; for there seem to be many occasions that are empty of danger in war, and the professional soldiers are most capable of seeing these at a glance. They appear courageous, then, because the others do not know what sorts of situations these are. Again, as a result of their experience, they are most capable of attacking and of defending—capable of using their weapons and having the sorts that are strongest both for attacking and for defending. They are like armed men, then, contending with unarmed ones, or trained athletes against private individuals; for in contests of this sort as well, it is not the most courageous who are the best fighters but those whose strength is greatest and whose bodies are in the best condition.

45. *Iliad* 22.100 (the speaker is Hector), 8.148–149 (the speaker is Diomedes).
46. 12.6–7.
47. Homer, *Iliad* 2.391–393 (the speaker is Agamemnon).
48. E.g., Plato, *Laches* 199a–b, *Protagoras* 360d.

Professional soldiers turn out to be cowards, however, when the danger overstrains them and they are inferior in numbers and equipment; for they are the first to flee, while the citizens stand their ground and are killed—precisely as happened at the temple of Hermes.[49] For to the citizens, fleeing is shameful and death is more choiceworthy than preserving their life at this cost, while the others were even from the very start facing up to danger on the supposition of being stronger, and when they come to know the truth, they flee, fearing death more than shame. But a courageous person is not like that.

People also count spirit as courage; for those who act because of spirit—like wild beasts that rush at the people who have wounded them—also seem to be courageous, because courageous people are spirited as well; for spirit is most ready to meet dangers. Again, Homer attests to this: "he put strength into his spirit," "rage and spirit he aroused," "bitter rage breathed through his nostrils," and "his blood boiled";[50] for all such expressions seem to signify the arousal of spirit and its impulse.

Courageous people act because of the noble, and spirit is their co-worker. Wild beasts, however, act because of pain; for they act because they have been struck or because they are frightened, since if they are in a forest, at any rate, they do not attack. But it is not courage to rush into danger because of suffering pain or because of being driven on and impelled by spirit while foreseeing none of the terrible outcomes, since that way even hungry asses would be courageous; for they do not stop grazing when they are beaten. Adulterers also do many daring things because of their appetite. But the courage that is caused by spirit seems not to be the most natural sort, and seems to be really courage once deliberate choice and the for-the-sake-of-which are added.

Human beings also suffer pain when they are angered, of course, and take pleasure in revenge. But people who fight because of these, though they may be good fighters, are not courageous; for they do not fight because of the noble or in the way reason prescribes but because of feeling. Still, they have something that is much the same as courage.

Optimistic people, then, are not courageous either; for it is because they have often been victorious and over many opponents that they are confident in facing dangers. But they are similar to courageous people, because both are confident. While courageous people are confident because of what we just mentioned, however, optimistic ones are confident because they think they are the strongest ones and that nothing could happen to them. (Drunks also behave in this sort of way; for they become optimistic.) But when things do not turn out as expected, they flee. But it is characteristic of a courageous person, as we saw, to endure things that are and appear frightening to a human being, because it is noble to do so or shameful not to.

49. In a battle near the city of Coronea in Boeotia in 353 BC.

50. *Iliad* 11.11, 14.151, 16.529; 5.470, 15.232, 594, *Odyssey* 24.318–319. "His blood boiled" is not in our Homer.

That is why it seems to be characteristic of a more courageous person to be fearless and calm in the face of frightening things that are sudden than of those that are clear beforehand, since doing so was more the result of his state of character, because it was less the result of preparation; for when things are evident beforehand we can deliberately choose what to do in accord with rational calculation and reason as well, while when they happen suddenly we must do so in accord with our state of character.

Ignorant people also appear courageous and are not far removed from optimistic ones but are inferior to them insofar as ignorant people have no sense of self-worth, while the others do. That is why optimistic people stand their ground for a time, while if ignorant ones have been deceived, and then recognize or suspect that the situation is other than [they supposed], they flee (which is precisely what happened to the Argives when they fell upon the Spartans taking them for Sicyonians).[51]

We have said, then, what sort of people courageous ones are, as well as the ones that seem to be courageous.

3.9
Courage, Pleasure, and Pain

Although courage is concerned with things that inspire confidence and with frightening things, it is not concerned with both equally but more with frightening ones; for the person who is calm in the face of frightening things, and is in the state one should be in where they are concerned, is courageous more than the person who is so in the face of things that inspire confidence. It is for enduring painful things, then, as we said, that people are called "courageous." That is why courage involves pain, indeed, and is justly praised; for it is more difficult to endure painful things than to abstain from pleasant ones.

Nonetheless, the end that is in accord with courage would seem to be pleasant but to be obscured by the circumstances, as also happens in athletic contests; for to boxers the end for the sake of which they fight is pleasant, the victory crown and the honors. But being struck by blows makes them suffer, if indeed they are made of flesh and blood, and is painful—as too is all their exertion. And because there is a lot of all that, that for the sake of which they fight, because it is small in extent, appears to have nothing pleasant about it.

If the same is also true about courage, death and wounds will be painful to the courageous person, and he will suffer them involuntarily. But he will endure them because it is noble to do so or shameful not to. Indeed, the more he is possessed of virtue in its entirety and the happier he is, the more he will be pained at the prospect of death; for to someone like that living is most worthwhile, and this person will be knowingly depriving himself of the greatest goods, which is a painful thing. He is

51. In a battle at Corinth in 392 BC.

no less courageous because of that, however, but perhaps even more so, because he chooses the noble in war in preference to those goods. It is not true, then, in the case of all the virtues, that it is pleasant to activate them, except insofar as doing so attains the end.

Presumably, there is nothing to prevent the best professional soldiers from being not people like that, but rather the sort who, while less courageous, possess no other good; for these are ready to face dangers and trade their lives for small profits.

So much for courage, then; it is not difficult to get at least an outline of what it is from what has been said.

3.10
Temperance (1)

After this virtue, let us discuss temperance; for courage and temperance seem to be the virtues of the non-rational parts.

We have already said that temperance is a mean concerned with pleasures (for it is less concerned—and not in the same way—with pains). Intemperance also appears in this area. With what sorts of pleasures temperance is concerned, we must now determine.

Let us distinguish, then, between pleasures of the soul and those of the body. Consider, for example, love of honor and love of learning; for in the case of each of these two, a person disposed to love them enjoys them without his body being affected at all, but rather his thought. But people concerned with pleasures like this are called neither "temperate" nor "intemperate." The same holds for those concerned with any of the other non-bodily pleasures; for if people are lovers of stories and inveterate gossipers, spending their days concerned with whatever random things are happening, we call them "idle chatterers," not "intemperate." Nor do we call people
1118a1 "intemperate" if they are pained over matters of wealth or friends.

With pleasures of the body, however, temperance would seem to be concerned—but not with all of these pleasures either; for people who enjoy objects of sight, such as colors, shapes, or a painting, are called neither "temperate" nor "intemperate," and yet it would seem possible, even in these cases, to enjoy them in the way one should or to do so excessively or deficiently. It is the same with the objects of hearing; for no one calls "intemperate" those who enjoy melodies or drama excessively or "temperate" those who enjoy these in the way one should. Nor do we do this where smells are concerned, except coincidentally; for people who enjoy the smells of apples, roses, or incenses are not called "intemperate," but rather the ones who enjoy those of perfumes or gourmet dishes; for intemperate people enjoy these, because through them they are reminded of the objects of their appetites. We also see other people enjoying the smells of food when they are hungry, but to enjoy such things is characteristic of the intemperate person; for in his case, these are the objects of his appetite.

Nor in the case of the other animals is there any pleasure regarding these perceptual modalities, except coincidentally. For what the dogs enjoy is not the smell of a hare but to eat it up, although the smell is what made them perceive it. Nor is the lowing of a cow what a lion enjoys but the cow's meat. The fact that the cow was nearby is something that the lion perceived because of the sound, and thus the lion appears to enjoy the sound. Similarly, what it enjoys is not seeing "a deer or a wild goat,"[52] but making a meal of it.

Temperance and intemperance are concerned with the sorts of pleasures that the rest of the animals share in as well (which is why they appear slavish and beast-like); these pleasures are touch and taste. But they appear to make little or no use even of taste; for the use of taste is to discern flavors, precisely as people do when testing wines, or chefs when preparing gourmet dishes. But discerning such things is scarcely what people enjoy—at any rate, intemperate ones do not. On the contrary, what they enjoy is indulging in them—which enjoyment, whether in eating and drinking or in the so-called pleasures of Aphrodite, comes about wholly through touch. That is why a certain gourmand[53] prayed for his gullet to become longer than a crane's, showing that it was touch that gave him pleasure. Intemperance, then, is related to the most widely shared of the perceptual modalities and so would justly seem to be disgraceful, because it characterizes us not insofar as we are human beings but insofar as we are animals.

To enjoy such things, then, and to like them most, is beast-like. For in fact the pleasures of touch that are most appropriate to free people must be excluded, such as the ones produced in gyms by massaging and heating; for the touching that is characteristic of the intemperate person does not concern the body generally but only certain parts of it.

3.11
Temperance (2)

Some appetites seem to be shared, others to be peculiar to individuals and acquired. For example, the appetite for nourishment is natural; for everyone has an appetite for dry or liquid nourishment, sometimes both, when he is in need of them, and for "bed," as Homer puts it,[54] when he is young and in his prime. But not everyone has an appetite for this or that sort of nourishment or for sex with the same people. That is why such an appetite appears to be peculiarly our own. Nonetheless, it does at least have something natural about it as well; for, though different things are pleasant to different people, there are also some things that everyone finds more pleasant than random ones.

52. Homer, *Iliad* 3.24.
53. *EE* $1231^{a}12$.
54. *Iliad* 24.130–131.

In the case of the natural appetites, few people make errors and only in one direction—that of excess; for to eat or drink random things until we are overfull is to exceed the quantity that is in accord with nature; for a natural appetite is for the replenishment of a need. That is why people who do this are called "gluttons," because they glut their belly beyond what one should. It is the utterly slavish people who turn out like this.

As regards the pleasures peculiar to individuals, however, many people do make errors and in many ways. For people are called "lovers of such-and-such" because they enjoy the sorts of things one shouldn't, or do so more than ordinary people do, or do so not in the way one should. And intemperate people go to excess regarding all these; for they actually enjoy some things one shouldn't (things one should hate, indeed) and if there are some things of the sort in question that one should enjoy, they enjoy them more than one should and more than ordinary people do.

It is clear, then, that intemperance is excess concerning pleasures and is blameworthy. Concerning pains, we are not said to be temperate—as we are said to be courageous—for enduring them, nor intemperate for not doing so. Rather, the intemperate person is so called for being more pained than one should at not getting pleasant things (indeed, the pain too is produced in him by the pleasure), and the temperate one for not being pained at the absence of pleasure or at abstaining from it.

1119[a]1 The intemperate person, then, has an appetite for all pleasant things or for the most pleasant ones, and is led by appetite so as to choose these before the others. That is why he is pained both when he fails to get them and when he has an appetite for them (for appetite involves pain), though it does seem strange to be pained because of pleasure.

People who are deficient concerning pleasures, and who enjoy them less than one should, scarcely occur; for that sort of insensitivity is not human; for even the rest of the animals distinguish among foods and enjoy some but not others. But if there is someone to whom nothing is pleasant, and who does not distinguish between one thing and another, he would be far from being human. This sort of person has not acquired a name, though, because he scarcely ever occurs.

The temperate person, for his part, is in a mean state concerning these matters; for he does not take pleasure in the things the intemperate person most enjoys but is, rather, repelled by them. Neither does he take it in those things generally that one shouldn't nor does he get intense pleasure from anything of that sort nor become pained by its absence. He does not have an appetite for them, or only moderately, and not more than one should, when one shouldn't, or in any of those ways generally. But pleasant things that are conducive to health or a good state, these he will desire moderately and in the way one should, as he will the other pleasant things that do not impede these or are not contrary to the noble or beyond his means. For the person who desires them the other way likes such pleasures more than they merit, while a temperate person is not like that but instead loves them in the way correct reason prescribes.

3.12
Intemperance

Intemperance seems more of a voluntary thing than cowardice does. For it comes about because of pleasure, cowardice because of pain, and of these, pleasure is something choiceworthy, pain something to be avoided. Also, pain utterly alters or destroys the nature of the person who has it, while pleasure does nothing of the sort. Intemperance, then, is a more voluntary thing. That is why it is a more disgraceful one; for it is actually easier to be habituated to pleasures; for many pleasant things occur in our lives, and the circumstances of habituation involve no dangers, while with frightening things it is the reverse.

It would seem, however, that cowardice and the particular actions of cowardice are not voluntary in the same way; for cowardice itself is without pain but the actions cause degeneration because of the pain involved, with the result that people even throw away their weapons and do other unseemly things. That is why the actions seem to be forced.

For the intemperate person it is the reverse. The particular actions seem voluntary (since the agent has the corresponding appetite and desire), while intemperance generally seems less so (for no one has an appetite to be intemperate).

We also apply the name "intemperance" to children's errors, as they have a certain similarity to it. Which is called after which makes no difference for present purposes, **1119b1** although it is clear that the posterior is called after the prior. The transference of the name, in any case, seems not to be a bad one; for something that desires shameful things and has a tendency to grow large must be disciplined, and appetite and child are most like this; for children also live in accord with appetite and it is mostly in them that the desire for pleasure is found.

So if appetite is not obedient and subordinate to the ruling element, it will grow and grow; for the desire for pleasure is insatiable and indiscriminate in the one who lacks understanding, and the activity of appetite causes its congenital tendency to grow, and if the appetites are large and intense, they even knock out rational calculation. That is why they should be moderate and few and not oppose reason in any way (this is the sort of thing we call "obedient" and "disciplined") and just as a child should live in accord with the commands of his tutor, so the appetitive part too should live in accord with reason.

Therefore, the temperate person's appetitive part must be in harmony with reason; for the target of both is the noble, and the temperate person has an appetite for the things one should and in the way and when one should, which is just what reason, for its part, prescribes.

So much, then, for temperance.

BOOK 4

4.1
Generosity

Let us next discuss generosity. It seems to be the mean concerned with wealth; for the generous person is praised not in matters of warfare or in those in which the temperate person is praised or, again, in legal judgments but rather as regards giving or getting wealth—especially the giving of it. By wealth we mean everything whose worth is measured by money.

Wastefulness and ungenerosity are excesses and deficiencies concerning wealth. Ungenerosity, for its part, we ascribe always to those who take wealth more seriously than one should, while in ascribing wastefulness to people we sometimes combine several things; for we call people who lack self-control "wasteful," as we do those who spend on intemperate extravagances. That is why they seem to be the basest of people; for they have many vices at the same time.

The name, then, does not properly belong to them; for by "wasteful" is meant the person who has one vice—that of destroying his substance; for the person who is being destroyed because of himself is wasteful, and the destruction of one's substance seems to be a sort of self-destruction, on the supposition that living depends on it. That, then, is what we take wastefulness to be.

Things that have a use can be used well or badly, and wealth is something that has a use. But the best user of each thing is the one who has the virtue concerned with it. Wealth, then, will also be best used by the person who has the virtue concerned with wealth. And this is the generous person.

Using wealth seems to consist in spending and giving it, while getting it and safeguarding it seem more a matter of possession. That is why it is more characteristic of the generous person to give to the people one should than to get from those one should and not get from those one shouldn't. For it is more characteristic of virtue to act as a benefactor than as a beneficiary and to do noble actions rather than not do shameful ones. And it is clear enough that giving goes along with benefaction and doing noble actions, while getting goes along with being a beneficiary and not acting shamefully.

Also, gratitude goes to the person who gives, not to the one who does not get, and praise goes more to him too. Also, not getting is easier than giving; for people part with what properly belongs to them less readily than they avoid getting what belongs to others. Also, those who give are the ones called "generous," while those who do not get are praised—not for being generous but, if for anything, for justice. And those who do get are not praised at all. Also, of all virtuous people, generous ones are pretty much the most loved; for they are beneficial and their being so lies in their giving.

Actions in accord with virtue are noble and for the sake of the noble. And the generous person will give for the sake of the noble and will do so correctly; for he will give to the people one should, in the amount one should, when one should, and so on for all the other things that go along with correct giving. And he will do it with pleasure or without pain; for what is in accord with virtue is pleasant or without pain, and least of all is it painful.

But the person who gives to the people one shouldn't, or not for the sake of the noble but due to some other cause, will not be called "generous" but something else, and neither will someone who finds giving painful; for he would choose wealth over noble action, and that is not characteristic of the generous person.

Nor will the generous person get from the sources one shouldn't; for that sort of getting is not characteristic of the one who does not pay honor to wealth. Nor will he be fond of asking for favors; for it is not characteristic of the benefactor to readily accept being a beneficiary. But he will get from the sources one should (for example, from his own possessions), regarding this not as noble but as necessary, in order to **1120^{b}1** have something to give. Nor will he neglect his own possessions, because, of course, he wishes to assist others by means of them. Nor will he give to random people, in order that he be able to give to those one should, when one should, and where it is noble to do so.

What is very characteristic of the generous person is even to be excessive in giving, so that he leaves less for himself; for it is characteristic of the generous person not to look out for himself. But it is in accord with wealth that generosity is said; for what is generous lies not in the size of what is given but in the state of the giver and is in accord with the giver's wealth. Nothing prevents a person who gives less from being more generous, then, if he has less from which to give.

Those who have not acquired their wealth themselves but inherited it seem to be more generous; for they have no experience of need. Also, everyone likes his own works more, as parents and poets do. It is not easy, though, for a generous person to be wealthy, because he is neither a getter nor a guarder of wealth, but is lavish with it and pays honor to it not because of itself but for the sake of giving. That is why people complain about luck, saying that those most deserving of wealth are the least wealthy. But it is not unreasonable that this happens; for we cannot have wealth if we do not supervise things in such a way as to have it—just as with everything else.

Nonetheless, the generous person will not give to those one shouldn't, when one shouldn't, and so on; for if he did, he would no longer be acting in accord with generosity, and, if he spent on those things, he would have nothing to spend on the ones one should. In fact, as we said, the one who spends in accord with his wealth and on the things one should is generous, while the one who spends excessively is wasteful. That is why we do not say that tyrants are wasteful; for it does not seem easy for their giving and spending to exceed the size of their possessions.

Because generosity is a mean, then, concerned with the giving and getting of wealth, the generous person will both give and spend on the things one should and

as much as one should, alike in matters small and great, and with pleasure. He will also get from the sources one should and as much as one should. For because the virtue is a mean concerned with both giving and getting, he will do both in the way one should; for giving that is decent goes along with the same sort of getting, and the getting that is not of that sort is contrary to decent giving. The giving and getting that go along with each other, then, are found at the same time in the same person, while those that are contrary to each other clearly aren't.

But if it should happen that a generous person does spend contrary to the way one should and to the correct way, he will be pained—but moderately so and in the way one should; for it is characteristic of virtue to be pleased and pained at the things one should and in the way one should. Also, the generous person is easy to deal with in matters of wealth; for he is susceptible to being treated unjustly, because he does not pay honor to wealth and is more annoyed if he has not spent what one should than he is pained if he has spent what one shouldn't and, in that respect, is not satisfied with Simonides.[55]

The wasteful person, for his part, errs in these matters too; for he is neither pleased nor pained at the things one should or in the way one should. This will become more evident as we proceed.

We have said, then, that wastefulness and ungenerosity are excesses and deficiencies in two things, giving and getting—we will also count spending in with giving. In fact, wastefulness is excessive in giving and not getting but deficient in getting, while ungenerosity is deficient in giving and excessive in getting—but only in small matters.

Certainly the two characteristics of wastefulness are scarcely ever coupled; for it is not easy, while getting from nowhere, to give to everyone; for private individual donors (precisely the people, in fact, who seem to be wasteful) soon outstrip their wealth. And yet this sort of person would seem to be better than the ungenerous person—and not just by a little bit. For he is easily cured, both by age and by poverty and is able to move toward the mean. For he has the characteristics of the generous person; for he both gives and does not get, though he does neither well nor in the way one should. If, then, he were changed in this respect, either through habituation or in some other way, he would be generous; for he will give to the people one should and will not get from the sources one shouldn't. That is why he does not seem to be of base character; for to be excessive in giving and in not getting is characteristic not of a depraved or ill-bred person but of a silly one. But the one who is wasteful in this way does seem much better than the ungenerous person, both because of what we have just said and because he benefits many people, while the ungenerous person benefits no one—not even himself.

However, the majority of wasteful people, as we said, also get from the sources one shouldn't and are, in that respect, ungenerous. They become acquisitive because

55. None of Simonides' surviving poems explains this allusion to him.

they wish to spend but are not readily able to do so, because they soon outstrip their resources. They are compelled, then, to seek provision from elsewhere. At the same time, because they actually think contemptuously of the noble, they also get from any **1121ᵇ1** source regardless; for they have an appetite for giving, but how and from what source they give makes no difference to them.

That is why their acts of giving are not generous, either; for they are not noble, done for the sake of the noble, or in the way they should be. On the contrary, these people sometimes enrich those who should be poor, giving nothing to people of 5 moderate character but a lot to flatterers or people who provide pleasure of some other sort. That is why most of them are intemperate—because they spend readily and on intemperate extravagances, they are prone to expenditures, and because they do not live with an eye to the noble, they incline toward pleasures.

The wasteful person who is left untutored changes in this direction, then, but, 10 with supervision, he could reach the mean and be as one should.

Ungenerosity, however, is both incurable (for old age and any sort of incapacity seem to make people ungenerous) and more natural to human beings than wastefulness; for ordinary people are more disposed to love wealth than to give it away. 15 Ungenerosity is also widespread and of many forms; for there seem to be many ways of being ungenerous. For it consists in two things—deficiency in giving and excess in getting—and so does not come about in its entirety in all cases but sometimes in separate bits, with some people tending to excessive getting, others to deficient giv- 20 ing. For people who are called "misers," "tightfisted," "skinflints," and the like are all deficient in giving, but they do not aim at what belongs to others or wish to get it—in some cases because of some sort of decency and being wary of what is shameful (for there are those who seem to guard their property—at least this is what they say—in order not to be compelled to do anything shameful; these include the cheeseparer, 25 who is so called because of his excessive reluctance to give anything away). But there are also those who because of fear keep their hands off what belongs to others, on the supposition that it is not easy for someone to take another's property without others taking his, so they are satisfied neither to get from others nor to give to them. 30

The other sort, by contrast, are excessive in getting, because they get anything and from any source—those, for example, who work in unfree occupations, such as pimps and everyone of that sort, and loan sharks, who lend small amounts at high interest. For all these people get from sources one shouldn't and in amounts one shouldn't. **1122ᵃ1**

What they apparently have in common is their love of shameful profit; for they all put up with reproach for the sake of profit—and a small profit at that. For those who, on a vast scale, get from sources one shouldn't and get things one shouldn't—such as tyrants who sack cities and plunder temples—are not called "ungenerous," but 5 "wicked," "impious," and "unjust." However a gambler and a robber[56] are included

56. Omitting καὶ ὁ λῃστὴς.

among the ungenerous; for they are lovers of shameful profit. For it is for the sake of profit that both ply their trades and put up with reproach, robbers facing the greatest dangers for the sake of what they can get, gamblers profiting from the friends to whom they should be giving. Both gamblers and robbers, then, are lovers of shameful profit, and so wish to profit from the sources they shouldn't. All such ways of getting, then, are ungenerous. And it makes perfect sense that ungenerosity is said to be the contrary of generosity; for it is a greater evil than wastefulness, and people err more in its direction than with respect to what we have described as wastefulness.

So much, then, for generosity and the vices opposed to it.

4.2
Magnificence

The next thing to discuss indeed would seem to be magnificence. For it too seems to be a virtue concerned with wealth. But unlike generosity, magnificence does not extend to all actions involving wealth but only to those actions concerned with expenditure, and in these, it surpasses generosity in magnitude. For, as the name itself (*megaloprepeia*) signifies, it involves expenditure that is appropriate (*-prepeia*) in its magnitude (*megalo-*). But the magnitude is relative; for it is not the same expenditure that is appropriate to someone equipping a trireme as to someone paying for a religious delegation. What is appropriate, then, is relative to the agent himself, what the action lies in, and what it concerns.

The person who, in matters that are small or moderate, spends in accord with worth—like the one who "gave to many a vagabond"[57]—is not called "magnificent," but someone who does so in great ones is. For the magnificent person is generous, but the generous person is none the more magnificent for that.

The deficiency corresponding to this state is niggardliness, while the excess is lack of refinement, tastelessness, and other things of that sort, which involve being excessive not in the magnitude of spending on the things one should but in being extravagant in circumstances one shouldn't and in ways one shouldn't. We will talk about these matters later.[58]

The magnificent person is like someone with scientific knowledge; for he is able to get a theoretical grasp on what is appropriate and spend great sums in a suitable way. For, as we said at the start,[59] the state is defined by its activities and by its objects. The magnificent person's expenditure is great and appropriate. His works, then, are also like that; for that is the way the expenditures will be great and appropriate to the work. So the work must be worthy of the expenditure and the expenditure of the work—or even exceed it. And the magnificent person will incur such expenditure for the sake

57. Homer, *Odyssey* 17.420.
58. 1123a19–33.
59. 4.2.

of the noble; for this is a feature common to the virtues. Further, he will do it with pleasure and lavishly; for exact accounting is niggardly. And he would investigate how what he accomplishes can be noblest and most appropriate rather than how much it costs or how to do it most cheaply.

It is necessary, then, for the magnificent person to be generous too. For the generous person will also spend as much as one should and in the way one should, and it is in these aspects of expenditure that the greatness (*mega*) of the magnificent (*megaloprepês*) person—as it were, the magnitude (*megethos*)—is found (for generosity concerns the same sorts of expenditures), and from the same expenditure it produces a more magnificent work. For the virtue of a possession and of a work are not the same. For a possession that is worth the most is the most estimable (for example, gold), while the most estimable work is the one that is great and noble (for the contemplation of it is wondrous and the magnificent is something wondrous). Also, the virtue of a work—its magnificence—lies in its magnitude. And this is found in the sorts of expenditure that are called "estimable"—for example, those concerning the gods (votive offerings, ritual objects, and sacrifices). And, similarly, those expenditures concerning everything daimonic, and cases where there is acceptable competition for the honor of furthering the common good—for example, when people think they should fund a chorus extravagantly, equip a trireme, or provide a feast for the city.

In all cases, as we said, expenditure is relative to the agent, both who he is and what resources he has (for the expenditure must be worthy of both), and appropriate not to the work alone but to the person producing it as well. That is why a poor person cannot be magnificent; for he does not have the resources to spend great amounts in an appropriate way. The one who tries to do so is silly; for it is contrary to his worth and to what he should do, while to spend in accord with virtue is to spend correctly. But spending great amounts is appropriate to those who already have such resources through themselves or their ancestors or connections, or to those who are well-bred or reputable or something else of that sort; for all these things involve magnitude and worthiness.

The magnificent person, then, is most of all someone like that, and magnificence is found most of all in these sorts of expenditures, as we said; for these are the greatest and generally most honored. But it is also found in private expenditures of the sort that come about only once, such as a wedding or something else like that, or something (if there is something) that the entire city or the most worthy people in it are eager for—concerned with receiving or sending off foreign guests, say, and giving gifts or receiving them in return; for it is not on himself that the magnificent person spends but on goods that are common, and so his gifts have something of the character of votive offerings. It is also characteristic of a magnificent person to provide himself with a house fitted to his wealth (for it is also an adornment of a sort) and, concerning such things, to prefer to spend on those works that will be long-lasting

(for those are the noblest) and, in each case, to spend what is appropriate (for the same things are not fitting for gods and human beings or for a temple and a tomb).

Also, since each expenditure is great in relation to its kind, the unconditionally most magnificent one is great in relation to a great work. And what is most magnificent here or there is what is great in relation to these or those things, and greatness in the work is different from greatness in the expenditure; for a very noble ball or oil flask has the sort of magnificence characteristic of a child's gift, but its price is not something great or generous. That is why it is characteristic of the magnificent person, in relation to whatever kind of thing he produces, to produce it magnificently (for that sort of thing is not easily surpassed) and in such a way that its worth is in accord with his expenditure.

Such, then, is the magnificent person.

The person who is excessive and unrefined exceeds by spending more than one should, as we said. For in matters of small expenditure, he spends a lot and is improperly extravagant—for example, by giving the members of his dining club a feast appropriate for a wedding, or, when he funds a chorus for a comedy, bringing them onstage dressed in purple, as they do in Megara.[60] And he will produce everything of this sort not for the sake of the noble but to demonstrate his wealth, thinking that he will be wondrous because of it. And where one should spend a lot his expenditure is small, and where one should spend a little it is great.

The niggardly person, on the other hand, will be deficient with regard to everything and, despite having spent the greatest sums, will destroy something noble over a small detail, both hesitating and, whatever he is producing, investigating how to spend as little as possible—both complaining about that and always thinking that he is producing something greater than one should.

These states, then, are vices, but at least they do not incur reproach, because they are neither harmful to a neighbor nor too unseemly.

4.3
Greatness of Soul

Greatness of soul (*megalopsuchia*), even from its name, seems to be concerned with great things (*megala*), and our first task is to grasp what sorts of things these are. And it makes no difference whether we investigate the state or the person who is in accord
1123b1 with it.

The person, then, who thinks himself worthy of great things and is worthy of them seems to be great-souled; for the person who does the same but not in accord with his worth is silly, while no one who is in accord with virtue is silly or lacks understanding. So the one we mentioned is great-souled. For the person who is worthy of

60. Reference unclear.

small things, and thinks himself worthy of them, is temperate but not great-souled; for greatness of soul requires magnitude, just as nobility of appearance requires a large body, while small people are elegant and well proportioned but not noble in appearance.

The person who thinks himself worthy of great things when he is unworthy of them is conceited; but not everyone who thinks himself worthy of greater things is conceited. The person who thinks himself worthy of smaller things than he is worthy of—whether he is worthy of great or moderate things—is small-souled, but also if he is worthy of small ones and thinks himself worthy of ones that are yet smaller. Also, the person who is most small-souled of all would seem to be the one who is worthy of great things; for what would he do if he were not worthy of so much? The great-souled person, then, is extreme in terms of greatness but in a mean in being as one should; for what he thinks himself worthy of is in accord with his worth, while the other people are excessive or deficient.

If, then, he thinks himself worthy of great things and is worthy of them, and most of all so if he is worthy of the greatest things, he would be most concerned with one thing. But worth is said of things in relation to external goods; and we would take the greatest of these to be the one we award to the gods, the one that the most worthy people most aim at, and the one awarded as the prize for the noblest accomplishments. But honor is like that; for it surely is the greatest of external goods. It is with honor and dishonor, then, that the great-souled person is concerned in the way he should be. And it is evident, even without argument, that great-souled people are concerned with honor; for it is most of all honor that the great[61] think themselves worthy of—but in accord with worth. The small-souled person, on the other hand, is deficient both relative to himself and relative to the great-souled person's worth, while the conceited person is excessive relative to himself but not in the least so relative to the great-souled one.

The great-souled person—if indeed he is worthy of the greatest things—would be the best person; for the better person is always worthy of what is greater and the best worthy of what is greatest. Therefore, the truly great-souled person must be good. Indeed, it would seem characteristic of the great-souled person to be great in each virtue. And so it would never be fitting for the great-souled person to flee with his arms pumping like a runner's or to do injustice; for what things will he do shameful actions for the sake of, when to him, at any rate, none of them is something great? And if one investigates particular cases, the great-souled person would appear completely ridiculous if he were not good. Neither would he be worthy of honor if he were base; for honor is a prize of virtue and is awarded to good people. Greatness of soul, then, seems to be like a sort of adornment of the virtues; for it makes the virtues **1124^{a}1** greater and does not come about without them. That is why it is difficult to be truly great-souled; for it is not possible without noble-goodness.[62]

61. Reading οἱ μεγάλοι.
62. *EE* 1249^{a}16–17.

It is with honor and dishonor, then, that the great-souled person is most concerned. And he will be moderately pleased by great honors conferred by excellent people, thinking that he is getting what properly belongs to him—or actually less; for no honor can match the worth of virtue that is complete in every way. Nonetheless, he will accept it at least because they have nothing greater to award him. But honor that comes from random people, or for small accomplishments, he will altogether treat with contempt; for it does not match his worth. It is the same way with dishonor; for it cannot justly attach to him.

It is most of all with honor, then, as we said, that the great-souled person is concerned. Nonetheless, his state concerning wealth and positions of power will be a moderate one—as it will be where good luck or bad luck are concerned (whichever way it turns out to be). So he will not be overjoyed by good luck or overly pained by bad luck. For his state of mind, even concerning honor, is not to think of it as the greatest thing. For positions of power and wealth are choiceworthy because of honor (at any rate, those who have them wish to be honored because of them), and so, to the person for whom even honor is a small thing, these other things will be small as well. That is why great-souled people seem to be arrogant.

It seems that strokes of good luck also contribute to greatness of soul. For the well-bred are worthy of honor, as are those who hold positions of power or who are wealthy; for they are in a superior position and whatever is superior with respect to some good is generally more honored. That is why these things make people more great-souled; for they are honored by some people. In truth, however, only the good person is worthy of honor, although the one who has both [goodness and these other things] is considered more worthy of it. But people who possess these other good things without possessing virtue are not justified in thinking themselves worthy of great things and cannot correctly be called "great-souled"; for without virtue that is complete in every way it is impossible. In fact, people who do possess these other good things are among the ones who become arrogant and wantonly aggressive. For without virtue they cannot easily handle strokes of good luck in a suitable way. And when they cannot handle it and consider themselves superior to other people, they despise them, although their own actions are no better than those of a random person. For they imitate the great-souled person without really being like him, although they imitate him where they can. On the one hand, they do not act in accord with virtue, then, and, on the other, they do despise others. The great-souled person is, indeed, justified in despising others (for his beliefs are true), but ordinary people despise others in a random way.

The great-souled person does not face danger in small matters, nor is he a lover of danger, because there are few things he honors. But he does face great dangers, and, when he does, he is unsparing of his life, on the supposition that it is not worthwhile to live at any price. He is also the sort of person who is a benefactor but is ashamed to be a beneficiary; for the former is characteristic of a superior, the latter of an inferior.

In fact, he reciprocates benefits with bigger ones; for that way the one who started the process will owe him a further debt and be the beneficiary.

Great-souled people also seem to remember the benefits they bestow but not the ones they have received (for the beneficiary is inferior to the benefactor, and the great-souled person wishes to be superior) and are pleased to hear about the former but displeased to hear about the latter. That is why Thetis does not mention to Zeus the benefactions she had provided on his behalf,[63] nor did the Spartans mention theirs to the Athenians, but only the ones they received.[64] It is also characteristic of a great-souled person to ask for nothing or hardly anything but to offer his services eagerly, and to exhibit his greatness to those with a reputation for great worth, or those who are enjoying good luck but to moderate his greatness to those in the middle; for it is a difficult and a dignified thing to show oneself superior to the former but an easy one to do so to the latter and, while adopting a dignified manner toward the former is not ill-bred, to do so toward humble people is unrefined, like displaying strength against the weak. Also, it is characteristic of a great-souled person not to go in for things that are generally honored or for things where others have first place, and to be inactive or delay acting except where there is great honor or a great thing to be accomplished, and to be a doer of few actions but of great and notable ones.

It is necessary too that he be open about his hatreds and loves (for keeping them from being noticed is characteristic of a fearful person, as is neglecting the truth rather than his reputation) and that he speak and act openly (for, because he is someone who despises people, he is a free-speaker and tells the truth except when he is being self-deprecating in the presence of ordinary people). Also, he is incapable of fashioning his way of living to suit another person, unless he be a friend; for to do so would be slave-like (which is why all flatterers are menial and all humble people are flatterers). Nor is he prone to wonder; for to him nothing is great. Nor is he resentful; for it is not characteristic of a great-souled person to dwell on things (least of all bad ones) but to disregard them. Nor is he someone fond of conversation about people; for he will not talk either about himself or about someone else; for he cares neither about winning praise for himself nor about how to get other people blamed.

On the other hand, he is not given to praise, which is why he also does not speak badly of people—even of his enemies, unless because of wanton aggression. As regards things that are necessary or small, he is least likely to complain or ask for help; for to do so is characteristic of someone who takes such things seriously. He is also the sort of person whose possessions are more noble and profitless than profitable and beneficial; for that is more characteristic of a self-sufficient person.

The movements characteristic of the great-souled person seem to be slow, his voice deep, and his speech steady; for the person who takes few things seriously is not the

63. An apparent misremembering of Homer, *Iliad* 1.503–527.

64. Aristotle is apparently referring to a Spartan embassy to Athens in 369 BC to ask for aid against the Thebans.

sort to hurry, nor is someone who thinks that nothing is all that great inclined to be tense. But shrillness of voice and hastiness come about because of these.

So that is what the great-souled person is like. The deficient one is small-souled, the excessive one conceited. People of these sorts do not seem to be bad either (for they are not malicious) but to be in error. For the small-souled person who is worthy of good things will deprive himself of the things he is worthy of and thus does seem to have something bad in him, stemming from his not thinking himself worthy of good things and from being ignorant of himself; for otherwise he would have reached out for the things he was worthy of, which are, of course, good ones. Nonetheless, people like that do not seem to be silly, at least, but to be lacking in self-esteem. Such a belief actually seems to make them worse, though; for each sort of person aims at what is in accord with his worth, but these people avoid even noble actions and pursuits because they think they are unworthy of them, and similarly external goods.

Conceited people, on the other hand, are silly and ignorant of themselves, and obviously so; for they try for things that are generally honored when they are not worthy of them and then are found out. And they adorn themselves with clothes and accessories and things of that sort, and, since they wish the strokes of their good luck to be evident, they talk about it, thinking they will be honored because of it.

Smallness of soul is more opposed to greatness of soul than conceitedness is; for in fact it comes about more often and is worse.

Greatness of soul is concerned with great honor, then, as we said.

4.4
Nameless Virtue Concerned with Honor

1125b1 There also seems to be a sort of virtue concerned with honor, as we said[65] in our first remarks, that would seem to be related to greatness of soul in much the same way as generosity is related to magnificence. For both of these virtues escape greatness, but, concerning moderate and small matters, they dispose us to be the way one should. And just as in getting and giving wealth there is a mean, an excess, and a deficiency, so in the case of honor as well we can desire it more or less than one should or from the sources and in the way one should. For we blame the honor-lover for aiming at honor more than one should or from sources one shouldn't, and we also blame the person who is indifferent to honor for deliberately choosing not to be honored even for noble things. But sometimes we praise the honor-lover as manly and a lover of the noble, and the one who is indifferent to honor as moderate and temperate—as we also said[66] in our first remarks.

65. 1107b24–30.
66. 1109b16–18.

Since we speak in more than one way of loving such-and-such, however, it is clear that we do not always apply "love of honor" to the same thing. Instead, when we are praising, we apply it to loving honor more than ordinary people do; when we are blaming, to loving it more than one should. But since the mean is nameless, the extremes dispute with each other as if it did not exist. Where there is excess and deficiency, however, there is also the mean. And people do desire honor both more and less than one should. There is also the case, then, of those who desire it in the way one should. It is this state, then, that is praised, because it is a mean concerned with honor, although a nameless one. Compared to love of honor, it appears as indifference to honor; compared to indifference to honor, as love of honor; and compared to both, as somehow both.

The same would seem to hold of the other virtues too. But here the extreme people seem opposed to each other because the person in the mean has not been given a name.

4.5
Mild-Manneredness

Mild-manneredness is a mean concerned with anger (the mean is actually nameless, as pretty much are the extremes, so we transfer mild-manneredness to the mean, although it leans toward the deficiency, which is itself actually nameless). The excess might be said to be a sort of irascibility (*orgilotês*), since the feeling here is anger (*orgê*), although the things that produce it are many and various.

The person who gets angry about the things one should, with the people one should, and further, in the way one should and both when and for as long as one should is praised. He, then, would be mild-mannered if indeed mild-manneredness is praised. For being mild-mannered means being calm and not being led by feelings but displaying anger in the way, about the things, and for the length of time that reason prescribes. But it seems to err more toward the deficiency; for the mild-mannered **1126^{a}1** person is not revengeful but considerate to others.

The deficiency, however, whether it is a sort of spiritlessness or whatever, is blamed. For people who are not angry at the things one should be seem silly, as do the ones who are not angry in the way one should, when one should, or with the people one should. Someone like that seems not to be perceptive, or not to feel pain, or—as he is not angry—not to be the sort to defend himself. But for someone to put up with insulting treatment and to stand by watching while this happens to those who are his kin is slavish.

The excess comes about in all these respects (that is, [when one is angry] with the people one shouldn't be, about things one shouldn't be, more than one should be, and more quickly and for a longer time), but at least they are not found in their entirety in the same person. For that would not be possible; for the bad ruins even itself, and if all the parts of it are present, it becomes unbearable.

Irascible people certainly become angry quickly and with people one shouldn't, about things one shouldn't, and more than one should, but they do stop quickly—and this is their best feature. In their case, this comes about because they do not bottle up their anger but retaliate openly, because of the quickness of their spirit, and then stop.

Hypercholeric people are excessively quick-spirited because they are irascible toward everything and on every occasion—hence their name.

Bitter people are difficult to make up with and stay angry for a long time; for they bottle up their anger. But it stops when they retaliate; for taking revenge puts a stop to their anger by producing pleasure in place of the pain. But if that does not come about, they hold a grudge; for because their anger is not open, no one tries to persuade them to give it up, and to digest anger inside ourselves takes time. People like this are the most troublesome to themselves and to their closest friends.

We call "harsh" those who display anger at the things one shouldn't, both more than one should and for a longer time, and who do not become reconciled without taking revenge or exacting punishment.

We regard the excess as more opposed to mild-manneredness; and indeed the excess actually comes about more often; for it is more human to want revenge. Also, harsh people are harder to live with.

But what we said[67] in our previous remarks too is also clear from the present ones; for it is not easy to define in what way, with whom, about what, and for how long one should be angry and up to what point someone is doing so correctly or in error. For the one who deviates a little—whether toward the more or toward the less—is not blamed; sometimes, indeed, we praise those who are deficient in anger and call them "mild-mannered," and sometimes we call those who display anger "manly," on the supposition that they are capable of ruling. How far, then, and in what way someone must deviate to be blameworthy is not easy to give in an account, for it lies in the particulars, and it is in perception that their discernment lies.

But this much is clear at least, that the mean state is praiseworthy, and that it is in accord with the mean state that we are angry with the people one should be, about the things one should be, in the way one should, and so on, while the excesses and the deficiencies are blameworthy—weakly if they are small, more if they are more, and very if they are large. It is clear, then, that we must cling to the mean state.

So much, then, for our discussion of the states concerned with anger.

4.6
Being Ingratiating and Being Disagreeable

In social interaction (that is, living with others and sharing in words and actions) some people seem to be ingratiating. These are people who praise everything in order

67. 1109b14–23.

to give pleasure and are never a hindrance, thinking that they should cause no pain to those they meet. People of the contrary sort, who are a hindrance in everything and think nothing of causing pain, are called "disagreeable" and "quarrelsome."

That the states mentioned are blameworthy, then, is clear enough, as is the fact that the mean state between them is praiseworthy—the one in accord with which we approve of the things one should, in the way one should, and are likewise repelled by them. No name has been given to this state, but it seems most of all like friendship. For this is the sort of person—the one in accord with the mean state—that we tend to call a "decent" friend, once affection is added.

The mean state differs from friendship, however, because it is without feeling and affection for those it relates to; for it is not because of loving or feeling enmity that this person approves of each thing in the way one should but because of the sort of person he is. For he will do so alike concerning those he does not know and those he does know or concerning intimates and non-intimates, except that in each case he will do it in the way that is fitting; for being thoughtful to intimates is not the same as being thoughtful to strangers, nor, again, is causing pain the same in both cases.

Putting it in universal terms, then, we have said that he will relate to others in the way one should and—referring to the noble and to the beneficial—will aim either at not causing pain or contributing to pleasure. For he seems to be concerned with pleasures and pains that come about in social interaction, and in such cases, if it is not noble (or is harmful) to contribute to the pleasure of others, he will be repelled and will deliberately choose to cause pain. And so if someone is doing something unseemly (and not just a little unseemly at that) or something that causes harm, and opposing it will cause little pain, he will not approve but be repelled.

He will relate differently to people of worth and to random ones, and to those more and those less well-known to him, and similarly as regards the other relevant differences, allocating to each group what is appropriate and choosing as an intrinsic good to contribute to pleasure and be wary of causing pain—but in a way that is guided by the consequences (I mean the noble and the advantageous), if these are greater. And for the sake of great pleasure in the future, he will cause small pain now.

That, then, is what the person in a mean is like, although he has not been given a name. Among those who contribute to the pleasure of others, the person who aims at being pleasant, not because of something else, is ingratiating, while the one who does so to get some benefit for himself (in terms of wealth or what comes because of wealth) is a flatterer. As for the person who is repelled by everything, we have said that he is disagreeable and quarrelsome. The extremes appear to be opposed to each other, however, because the mean is nameless.

4.7
Truthfulness

Concerned with pretty much the same things is the mean between boastfulness and self-deprecation, which is also nameless. But it is not a bad idea to go through states of this nameless sort as well; for we will know more about issues relating to character if we have gone through each particular one, and we will be more convinced that the virtues are mean states if we see that this holds in the case of all of them. In regard to living with others, then, those who engage in social interaction with a view to pleasure and pain have been discussed. Now let us discuss those who are true or false in words and actions alike and in their pretensions about themselves.

The boaster, then, seems to be someone who pretends to have reputable qualities that he does not have or to have greater ones than he has, while a self-deprecator seems to be the reverse and to disavow or belittle those qualities he has. The person in a mean, however, seems to be himself, so to speak—truthful in life and word, acknowledging as his the qualities he really has, and neither magnifying nor diminishing them.

It is possible to do each of these things either for the sake of something further or of nothing further. But each sort of person speaks and acts in accord with the sort of person he is and lives that way too, provided he is not acting for the sake of something further. The false, however, is intrinsically base and blameworthy, while the true is intrinsically noble and praiseworthy. Thus the person who is truthful, because he is in a mean, is also praiseworthy, while the two who are false are blameworthy—and boasters more so. But before we speak about these two, we should first speak about the person who is truthful.

For we are not talking about the person who is truthful in his agreements or in matters that contribute to justice or injustice (for these would belong to a different virtue) but about the one who, in situations in which there is nothing of that sort to make a difference, is truthful both in word and life because that is what his state of character is like. And someone like that would seem to be decent. For the lover of truth, because he is truthful even in situations where it makes no difference, will be yet more truthful in those where it does make a difference; for in these cases he will be wary of falsehood as a shameful thing, since he was already wary of it intrinsically. And the person like that is praiseworthy. But he is more inclined toward telling less than the truth; for this appears more suitable, because the extremes are more offensive.

The person who, not for the sake of anything, pretends to more than he has is like someone base (for otherwise he would not enjoy being false) but is more vain and foolish, apparently, than bad. If it is for the sake of something, the one who does it for reputation or honor is not extremely blameworthy, while the one who does it for money or for things that bring money is more unseemly. (It is not due to his capacity that someone is a boaster, however, but due to his deliberate choice; for it is in accord

with his state of character that he is a boaster, and by being that sort of person.) In the same way, someone may be false because he enjoys the falsehood itself or because he desires reputation or profit.

Those who boast for the sake of reputation pretend to be the sorts of things that are praiseworthy or that are thought to make us happy, while those who boast for profit pretend to be the sorts that please their neighbors and that one can avoid being detected for not really being, such as a prophet, a wise person, or a doctor. That is why most boasters pretend to qualities like this; for it is in them that the features mentioned are found.

Because self-deprecators underestimate themselves in what they say, they appear to have more sophisticated characters; for they do not seem to speak for the sake of profit but to avoid pomposity. But it is most of all the reputable qualities that they utterly deny, as indeed Socrates used to do.[68]

Those who disavow small and obvious qualities, however, are called "affected," and are more easily despised—in fact, doing so sometimes appears to be boastfulness, as when people wear Spartan dress; for both the excess and the extreme deficiency are boastful. But people who use self-deprecation in a moderate way, in regard to qualities that are not excessively pedestrian and obvious, appear sophisticated.

It is the boastful person who appears to be opposed to the truthful one; for he is worse [than the self-deprecator].

4.8
Wit

Since life also includes relaxation and the latter includes pastimes that involve amusement, it seems that here too there is a sort of social interaction that is suitable, and sorts of things one should say and ways one should say them, and similarly for listening. It also makes a difference whether we speak in the midst of people of that sort or **1128ª1** listen to people of that sort. And clearly concerning these things there is also excess and deficiency in relation to the mean.

People who go to excess in trying to cause laughter seem to be buffoons and unrefined, doing anything to cause a laugh and aiming at producing laughter rather than at saying things that are gracious and do not cause pain to the butt of their jibing. But those who never say anything to cause laughter themselves, and are repelled by those who do, seem boorish and stiff. People who are amusing in a gracious way, on the other hand, are called "witty" (*eutrapeloi*), as they are quick on the return (*eutropoi*); for things of this sort seem to be movements of people's characters, and just as our bodies are judged from our movements, so are our characters. But since occasions for causing

68. E.g., Plato, *Apology* 20d–e, 21b, *Hippias Major* 286c–d, 304d–e, *Laches* 190b–c, *Lysis* 212a, 223b.

laughter are prevalent, and most people enjoy amusement and jibing more than one should, buffoons are also called "witty," because they are thought sophisticated. But that there is a difference here, and no small one, is clear from what we have said.

Dexterity is also something that properly belongs to the mean state; and it is characteristic of the dexterous person to say and to listen to the sorts of things that are fitting for those who are decent and free; for there are some things that it is appropriate for such a person to say as part of amusement, and also to listen to, and the amusement of the free person differs from that of the slavish one, and that of the well-educated person from that of the uneducated one. We can also see this from old-style and new-style comedies;[69] for in the former what caused laughter was shameful language, while in the latter it is more innuendo, and there is no small difference between these as regards graciousness.

Must the person who jibes well be defined, then, as saying things that are not unsuitable for a free person or that do not cause pain to his listener or even delight him? (Or is that sort of thing in fact indeterminate? For different things are hateful and pleasant to different people.) And he will listen to the same sorts of things; for the sorts he can endure listening to seem to be the sorts that he produces himself.

He will not, then, produce every sort of jibe; for jibes are a sort of abuse, and legislators forbid the abuse of certain things, and presumably should forbid some sorts of jibing as well. The sophisticated and free person, then, will be like that, because he is, as it were, a law for himself. That, then, is what the person in a mean is like, whether he is said to be dexterous or witty.

The buffoon cannot resist what causes laughter—sparing neither himself nor anyone else if he can produce a laugh and saying the sorts of things that the sophisticated person would never say and some he would not even listen to.

1128b1 The boor, on the other hand, is useless in social interaction of this sort; for he contributes nothing and is repelled by everything. But it seems that relaxation and amusement are necessary in life.

The means in life that we have discussed, then, are three, and all of them are concerned with sharing in certain sorts of words and actions. They differ because one is concerned with truth, while the others are concerned with pleasure. Among those concerned with pleasure, one is found in amusements, the other in social interaction in the rest of life.

4.9
Shame

Shame is not fittingly spoken about as a sort of virtue; for it is more like a feeling than a state. Shame is defined, at any rate, as a sort of fear of disrepute, and its effects are much the same as those of the fear of frightening things; for people who are ashamed

69. F167 18.

of themselves blush, and those who fear death turn pale. Both shame and fear appear, then, to be somehow bodily, which seems to be precisely what is characteristic of a feeling rather than a state.

The feeling is fitting not to every age, however, but to the young. For we think that young people should have a sense of shame because they live by their feelings (and so make many errors) but are restrained by shame. Also, we praise those young people who have a sense of shame. But no one would praise an older person for being prone to shame; for we think that he should not do any action that gives rise to shame. For shame is not even something characteristic of decent people, if indeed it arises from base actions (for actions of this sort must not be done; and whether they are truly shameful or reputed so makes no difference; for neither must be done; so a decent person must not feel shame). In fact, shame is characteristic of a base person, who is the sort to do shameful actions. But to be the sort of person who would feel ashamed if he were to do actions like that and then thinks himself to be decent because of it, is strange; for shame is felt toward voluntary actions, and the decent person will never voluntarily do base actions.

But, on the basis of a hypothesis, shame would be decent, in the sense that if someone were to do such actions, he would feel ashamed. But this hypothetical character is not possible where the virtues are concerned. And even if shamelessness is something base, as is not being ashamed of doing shameful actions, it still does not follow that the person who is ashamed of doing these actions is decent.

Self-control is not a virtue either, but a sort of mixed virtue. It will be discussed later.[70] Now let us speak about justice.

BOOK 5

1029^{a}1

5.1
Sorts of Justice

As regards justice and injustice, we must investigate what sorts of actions they are concerned with, what sort of mean state justice is, and what the just is a mean between. And let our investigation be in accord with the same methodical inquiry as our preceding discussions.

We see, then, that what everyone means to say about justice is that it is the sort of state from which people are doers of just things—that is, from which they do just actions and wish for what is just. It is the same way with injustice: it is the state from which people do injustice and wish for what is unjust. That is why the first thing we should do is to assume these things as an outline.

70. 7.1–10.

For it is not the same in the case of both capacities and sciences as it is with states. For the same capacity or science seems to result in contraries, while a state that is contrary to another does not result in contraries—for example, from health we do not do contrary actions, but healthy ones only (for we say that someone is walking in a healthy way when he walks in the way the healthy person would).

A state, then, that is contrary to another is often known from its contrary, and often the states are known from their underlying conditions; for if indeed the good state is evident, the bad one also becomes evident, and the good state becomes evident from what conduces to it, and from it, the things that are conducive to it. For if the good state is firmness of flesh, the bad state must indeed be flabbiness of flesh, and what is conducive to the good state is what is productive of firmness of flesh.

It follows for the most part that if one of a pair [of contraries] is said of things in more than one way, the other is also said of things in more than one way—for example, if just is, unjust is as well.

It seems that justice and injustice are said in more than one way but that the homonymy escapes notice because of their closeness and is less clear than when the ways are further apart (for here there is a big difference in their appearance)—as, for example, when both the clavicle of an animal and the thing we open a door with are said to be keys homonymously.

Let us grasp, then, in how many ways someone is said to be unjust. The unlawful person, then, seems to be unjust, as does the greedy or unfair one, so it is clear that both the lawful and the fair person will be just. Therefore, the just will be what is lawful and what is fair, and the unjust will be what is unlawful and what is unfair.

1129b1 But since the unjust person is greedy, he will be concerned with goods—not with all of them but with those that are matters of good and bad luck, which are always good, unconditionally speaking, but for this or that person, not always so. (These are the ones human beings pray for and pursue. But they should not. Instead, they should pray that unconditionally good things will also be good for them, while choosing the ones that are good for them.)

The unjust person does not always choose too much. Instead, in the case of the unconditionally bad things, he actually chooses too little. But because the lesser evil also seems somehow good and greed is for what is good, he seems to be greedy. In fact, he is unfair; for this term encompasses the two cases and is what they have in common.

But since, as we saw, the unlawful person is unjust and the lawful one just, it is clear that all lawful things are somehow just; for indeed the things defined by legislative science are lawful, and each of these, we say, is just. The laws, for their part, pronounce about all matters, aiming either at the common advantage of all or at that of the best people or of those who—in accord with their virtue or in accord with some other such thing—are in control. So, in one way, the things we call "just" are the ones that produce and safeguard happiness and its parts for the political community.

The law, however, also prescribes that one do the works of a courageous person (for example, not breaking rank or fleeing or throwing down one's weapons), as well as those of a temperate person (for example, not committing adultery or wanton aggression) and those of a mild-mannered one (for example, not striking people or verbally abusing them). It is the same way as regards the other virtues and sorts of depravity, the law orders some things and forbids others—correctly, if established correctly, less well if done so carelessly.

This sort of justice, then, is complete virtue—not unconditionally but in relation to another person. And that is why justice often seems to be the most excellent of the virtues, with the result that "neither the evening star nor the morning star is so wondrous,"[71] and, as the proverb says, "in justice is all virtue summed."[72] And it is complete virtue in the highest degree, because it is the complete use of complete virtue.[73] It is the complete use because the one who possesses it is able to use his virtue in relation to another person and not solely with regard to himself; for many people are able to use their virtue in what properly belongs to themselves but unable to do so in matters relating to another person.

And that is why Bias' saying seems to be well put, that "ruling office reveals the man." For a ruler is already in relation to another person and in a community. It is also because of this very same thing that justice, alone of the virtues, seems to be the good of another, because it is in relation to another person. For it does what is advantageous for someone else, whether ruler or community member.

The worst sort of person, then, is the one who uses his depravity both in relation to himself and in relation to his friends, while the best sort is not the one who uses his virtue in relation to himself but the one who uses it in relation to another person; for that is difficult work.

This sort of justice, then, is not a part of virtue but is virtue as a whole, nor is the injustice contrary to it a part of vice but is vice as a whole.

Besides, the difference between virtue and justice of this sort is clear from what we have said; for they are the same state, but the being [for them] is not the same. Instead, insofar as the state is in relation to another person it is justice, while insofar as it is unconditionally a state of a certain sort, it is virtue.

5.2
Special and General Justice

What we are seeking, however, is the justice that is a part of virtue; for there is one, so we say. And it is the same way as regards the injustice that is a part of vice.

71. Euripides, *Melanippe*, Fr. 486 Nauck.
72. Theognis, ln. 147 Diehl.
73. Reading τῆς τελείας ἀρετῆς χρῆσίς ἐστιν τελεία.

A sign of this is that a person who actively behaves in accord with other sorts of depravity acts unjustly, to be sure, but is not at all greedy—for example, the one who throws down his shield because of cowardice, who engages in verbal abuse because of harshness, or who does not help someone with his wealth because of ungenerosity. On the other hand, when someone is greedy, often his action is not in accord with any of these vices and certainly not with all of them. Yet it is in accord with some sort of wickedness at least, namely, injustice; for we blame it. Therefore, there is another sort of injustice that is a part of the whole, and another way for something to be unjust by being a part of the unjust in the sense of contrary to law.

Further, if one person commits adultery for profit and makes money on it, while another does it—spending and so losing money on it—because of appetite, the latter would seem to be intemperate rather than greedy and the former to be unjust but not intemperate. Therefore, it is clear that this is because the former does it to make a profit.

Further, as regards every other sort of unjust action, its occurrence is always attributed to some particular sort of depravity—for example, if someone has committed adultery, to intemperance; if he broke rank, to cowardice; or, if he struck someone, to anger. But if the action was one of making a profit, it is attributed to no sort of depravity besides injustice.

So it is evident that there is another sort of injustice beyond injustice as a whole that is a part of it. It has the same name, because its definition places it in the same kind; for they both exercise their capacity in relation to another person. The former is concerned with honor, wealth, or preservation (or—if we had one name for it—whatever includes all these) and is due to the pleasure of making a profit, while the latter is concerned with all the things that are the concern of the excellent person.

It is clear, then, that there are several sorts of justice and that there is a distinct sort besides virtue as a whole. What it is and what sort of thing, we must now ascertain.

In the case of the unjust, we distinguished[74] between the unlawful and the unfair, and in the case of the just, between the lawful and the fair. The injustice discussed above is the unlawful sort. Since the unfair and the unlawful are not the same, however, but are distinct, as part from whole (for everything unfair is unlawful but not everything unlawful is unfair), so this unfair sort of the unjust and of injustice are not the same but different from the other sort, the former as parts, the latter as wholes; for this injustice is a part of injustice as a whole, and, similarly, this justice is a part of justice as a whole. So we must also speak about the justice that is a part, about the injustice that is a part, and about the just and the unjust in this way.

We may set aside, then, the justice and injustice that are prescribed in accord with virtue as a whole, since the first is the use of virtue as a whole in relation to another person and the second the use of vice. And it is evident how we must distinguish the just and the unjust in accord with these; for the majority of lawful actions are pretty

74. 1129a32–b1.

much the ones prescribed by virtue as a whole; for the law prescribes living in accord with each virtue and forbids living in accord with each depravity.

What produces virtue as a whole are the conventions ordained by the laws concerned with education that looks to the common good. (Whether the education concerned with a particular individual, on the basis of which he is unconditionally a good man, is a matter for politics or for another science, and is something we must determine later;[75] for being a good man is presumably not in every case the same as being a good citizen.)

One form of the justice that is a part, and of the just in this way, is the one found in the allocations of honor, wealth, or any of the other things that are to be divided among those who share in a constitution (for in the case of these things, it is possible for one person to have a share that is unequal or equal to another's).

Another is rectification in transactions. Of it, there are two parts; for some transactions are voluntary, others involuntary. The voluntary ones are such things as selling, buying, lending with interest, pledging, giving free use of something, depositing, and hiring out (these are called "voluntary" because the starting-point of the transactions is voluntary). Among the involuntary ones, some are clandestine (for example, theft, adultery, poisoning, pimping, enticing away slaves, murder by treachery, and perjury), while others involve force (for example, assault, imprisonment, murder, abduction, disabling, verbal abuse, and insulting treatment).

5.3
Distributive Justice

Since the unjust person is unfair and the unjust is unfair, it is clear that there is also a mean between the unfair extremes. This is what is fair or equal;[76] for in any sort of action in which there is the too much and the too little, there is also what is fair or equal. If, then, the unjust is unfair or unequal, the just is fair or equal—which is precisely what everyone believes even without argument.

Since the fair is a mean, the just would be a mean of some sort. But the fair or equal involves at least two terms. It is necessary, then, for the just to be both a mean and fair or equal, and related to something, and for some people. And insofar as it is a mean, it will be between certain things (and these are the too much and the too little); and insofar as it is fair or equal, it will involve two shares; and insofar as it is just, it will be so for certain people. Therefore, it is necessary for the just to involve at least four terms: those, of course, for whom it is just, which are two, and the things involved (the shares), which are two.

75. $1180^{a}14$–$^{b}28$.

76. A fair share is an equal (*ison*) one, an unfair share an unequal (*anison*) one. "Fair or equal" and "unfair or unequal" are used when this fact is playing a role in the argument.

Also, the fairness or equality will be the same for the people and for the shares involved; for the latter (the shares involved) will stand in the same relation to each other as the people; for if the people are not equal, they will not have equal shares. Indeed, it is from this that quarrels and complaints arise, when either equals get unequal shares (that is, get them in an allocation) or unequals get equal ones.

Further, this is clear from its being in accord with worth; for everyone agrees that the just in allocations should be in accord with some sort of worth. But they are certainly not all speaking about the same sort of worth. Instead, to democrats, worth lies in freedom; to oligarchs, in wealth; to others, in good breeding; and to aristocrats, in virtue.

Therefore, the just is a proportion of some sort. For being proportional is special not to number consisting of units alone but to number in general; for proportion is equality of ratios and involves at least four terms. (That a divided proportion involves four terms is clear enough. But so does a continuous proportion; for it uses one term as two, that is, it mentions it twice—for example, as line A is to line B, so line B is to line C. Line B, then, has been mentioned twice. So if line B is put in twice, the terms in the proportion will be four.)

Also, what is just will involve at least four terms, and the ratio is the same; for the people [A and B] and the shares [C and D] involved are similarly divided. Therefore, as term A is to term B, so term C is to term D; and hence, taking them alternately, as A is to C, so B is to D. So the whole (A + C) will also be so related to the whole (B + D). This is precisely the way the allocation couples them and, if it puts them together that way, couples them justly.

Therefore, the coupling of A with C and that of B with D is the just in allocation. And the just in this way is a mean, while the unjust is contrary to the proportional; for the proportional is a mean and the just is proportional. (Mathematicians call this sort of proportion "geometrical"; for in the geometrical sort, the relation of whole to whole is precisely the relation of each term of a pair to the other term.) But our proportion is not continuous; for there is not a single numerical term for person and share.

The just, then, is this: the proportional. The unjust, on the other hand, is what is contrary to the proportional. Hence one share becomes too much and the other too little, which is precisely what happens in practice; for the person doing the injustice gets too much of what is good, while the one treated unjustly gets too little. In the case of what is bad, it is the reverse; for the lesser evil in the ratio becomes a good in relation to the greater evil (for the lesser evil is more choiceworthy than the greater, what is choiceworthy is a good, and what is more so is a greater good).

This, then, is one form of the just.

5.4
Rectificatory Justice

The remaining one is rectificatory, which is found in transactions, both voluntary and involuntary. And this form of the just is different from the previous one. For the just in an allocation from common funds is always in accord with the proportion mentioned; for if in fact there is going to be an allocation from wealth that is common, it will be in accord with precisely the same ratio as the investments in it have to each other. And the injustice that is opposed to this justice is the one contrary to that proportion.

The just in transactions, on the other hand, is a sort of equality and the unjust a sort of inequality—although one in accord not with the previous proportion but in accord with the arithmetic one. For it makes no difference whether a decent person **1132^{a}1** has defrauded a base person or a base person has defrauded a decent one; or whether it is a decent person who committed adultery or a base one. On the contrary, the law looks only to the difference created by the harm done but treats the people involved as equals, whether one is doing an injustice and the other is suffering it, or one doing a harm and the other suffering it.

So the unjust in this way, since it is a case of inequality, the judge tries to make equal; for even when one person is struck and another does the striking or one actually kills and the other is killed, the suffering and the action constitute unequal parts in a division, and the judge tries to make them equal with respect to the loss by subtracting from the perpetrator's profit.

For when we are describing such cases in simple terms, even if the terms do not properly apply in some of them, we speak of the profit, for example, for the one striking the blow and of the loss for the one suffering it. It is after what was suffered has been measured, at any rate, that the second is called a "loss" and the first a "profit."

So the equal is a mean between the too much and the too little. But the too much and the too little constitute a profit or a loss in contrary ways—too much good or too little bad constitutes a profit and the contrary a loss. A mean here, as we saw, is the equal, and it, we say, is just. So the rectificatory just will be the mean between loss and profit.

That is why too when people are involved in dispute they have recourse to the judge. Going to the judge, however, is going to justice; for the judge wishes to be, as it were, animate justice. Also, they seek the judge as a mean—in fact, some people call judges "mediators," on the supposition that those who can hit the mean are the ones who will hit the just. Therefore, the just is a mean in some way, if indeed the judge is also one.

The judge, however, equalizes things exactly as if they were a line divided into unequal segments and what he had done was subtract from the larger segment the amount by which it exceeded the half-line and added it to the smaller segment. And when the whole has been divided in two, then people say that each has his own share

when he gets what is equal—where the equal is a mean between the too much and the too little that is in accord with the arithmetic proportion.

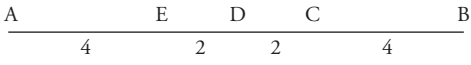
That is why it is called *dikaion* ("just"), because it consists in dividing *dicha* (in two), as if we had said *dichaion* and as if a *dikastês* ("judge") was a *dichastês*. For when a certain amount is subtracted from one of two equal things and added to the other, the second exceeds the first by two times that amount; for if the amount had been subtracted from the one but not added to the other, the second would have exceeded the first by only one times the amount. Therefore, the second was exceeding the mean by one times the amount and the mean was exceeding the thing from which something was subtracted by one times the same amount.[77]

Therefore, this is the way to come to know both what to subtract from the one who has too much and what to add to the one who has too little; for to the one who has too little there must be added the amount by which the mean exceeds it, while the amount by which the mean is itself exceeded must be subtracted from the greatest share. Let the lines AA′, BB′, CC′, and DD′ be equal to each other. From AA′ let AE be subtracted and let CD be added to CC′, so that the whole line DCC′ exceeds EA′ by the segment CD and CF, then AE will exceed BB′ by CD.

{This also holds in the case of the various crafts; for they would have been abolished if the producer had not produced something of both a certain size and a certain quality and if the recipient had not received this and in that size and that quality.}[78]

These names, "loss" and also "profit," are derived from voluntary exchange; for having more than one's own share is called "making a profit," while having less than the one had at the start is called "suffering a loss"—as it is, for example, in buying and selling and other transactions in which the law grants immunity. When neither too much nor too little results, however, but the same as was given, the parties say they have what is their own and are neither suffering a loss nor making a profit. So the just is a mean between a certain sort of profit and loss in matters that are counter to what is voluntary, consisting in having an equal amount both before and after the transaction.

77. AB divided is into two equal segments AD (6 units), DB (6 units). ED (2 units) and DC (2 units) are equal segments of AD and DB.



Aristotle is imagining that ED is subtracted from AD, resulting in AE (4 units) and added to DB, resulting in EB (8 units). EB (8 units) now exceeds AE (4 units) by (2 × 2) units. The mean is 6 units. The share EB (8 units) that is too much exceeds the mean by (1 × 2) units and the mean exceeds the share that is too little, AE (2 units), by (1 × 2) units.

78. Repeated 1133a14–16 where it is secluded.

5.5
Justice in Exchange

It seems to some people, however, that reciprocity too is unconditionally just, as the Pythagoreans used to say;[79] for they defined the just unconditionally as what stands in a reciprocal relation to another. But reciprocity does not fit either the case of the just in an allocation or the case of the just in a rectification. (And yet this, at any rate, is what people wish even Rhadamanthys' line about justice to mean, "If a person suffered what he did, right justice would be done."[80]) For in many ways reciprocity clashes with them. For example, if a ruling officer strikes someone, he should not be struck in return; and if a ruling officer was the person struck, the one who struck him should not only be struck back but punished too. Further, voluntariness and involuntariness make a great difference.

In communities based on exchange, however, what binds the parties together is the just in this way: reciprocity that is proportional and not equal. For it is by proportional reciprocity that a city stays together. For people either seek [to return evil for] evil (and if they do not, it seems like slavery) or [good for] good (and if they do not, no giving in return takes place), and it is by giving in exchange that they stay together. That is why cities erect the temple of the Graces (*Charites*) in a conspicuous place, in order that there might be a return for what is given; for this is the special characteristic of gratitude (*charis*); for we should not only do a service in return for someone who has done us a favor (*ho charisamenos*) but, on another occasion, start by doing a favor too. **1133ª1**

What produces proportional exchange is diagonal coupling. Let A be a builder, B a shoemaker, C a house, and D a shoe. The builder, then, must get from the shoemaker the shoemaker's product and give him his own product in return. If indeed there is first proportional equality, and then reciprocity is achieved, there will be what was mentioned. If not, there is no equality and nothing to keep the parties together; for there is nothing to prevent the product of one of them from being more excellent than that of the other. These products, then, must be equalized. {This also holds in the case of the various crafts. For they would have been abolished if the producer had not produced something of both a certain size and a certain quality and if the recipient had not received this and in that size and that quality.}[81] For it is not from two doctors that a community comes about but from a doctor and a farmer and, in general, from people who are different and not equal. And these must be equalized. That is why everything that is exchanged must be in some way commensurable.

It is for this purpose that money has been introduced and becomes a sort of mean; for, since it measures everything, it also measures excess and deficiency and how

79. See DK 14 (Pythagoras), 44 (Philolaus) = TEGP, pp. 486–515, 47 (Archytas of Tarentum).
80. Hesiod, Fr. 286.
81. Secluded here; read at $1132^{b}9$–11.

many shoes are equal to a house or nourishment. Precisely as builder is to shoemaker, therefore, so must such-and-such number of shoes be to a house or nourishment. For if this does not happen, there will be no exchange and no community. And it will not happen unless the things in question are in some way equal. Therefore, they must all be measured by some one thing, as was said previously. In truth, this one thing is need, which binds everything together; for if people neither needed things nor needed them to a similar extent, either there would be no exchange or not the same [as the existing one]. It is indeed as a sort of exchangeable representative of need that money came into being on the basis of convention and is called "money" (*nomisma*) because of this—because it exists not by nature but by conventional law (*nomos*), and changing it or rendering it useless is up to us.

Reciprocity will exist, then, when equalization has taken place, with the result that precisely as farmer is to shoemaker, so a farmer's product is to a shoemaker's. But we must not introduce them [as terms] in the figure of proportion when they have already made the exchange (otherwise one extreme will have both of the excess amounts) but when they both still have what is their own. That way they will be equals and community members, because this sort of equality can come about in their case: A is a farmer, C nourishment, B a shoemaker, and D his equalized product. But if reciprocity could not be achieved in this way, there would be no community.

That it is need that binds them together—since it is, as it were, one thing—is made clear by the fact that when the parties are not in need of each other—whether mutual or one-sided—they make no exchange, just as when someone needs what one has oneself, for example, when people permit the export of corn in return for wine. Therefore, this proposed exchange must be equalized. And for the sake of future exchange, [even] if we need nothing now, because there could be such need in the future, money is a sort of security for us; for by bringing this we must get [what we need].

The same thing also happens to money, certainly; for it does not always have equal [purchasing] power. Nonetheless, it tends to be more stable. That is why everything must be assigned a price; for that way there will always be exchange, and if we have this, there will be a community. Money, then, acts like a measure that by making things commensurable equalizes them; for there would be no community without exchange, no exchange without equality, and no equality without commensuration either. In truth, to be sure, it is impossible for things so different to become commensurable, but in relation to our needs they can become adequately so.

There must, then, be some single measure, but it will be one based on a hypothesis, which is why it is called "money" (*nomisma*); for money makes everything commensurable; for everything is measured in money. A is a house, B ten minas, C a bed: A is half of B, provided a house is worth five minas, or is equal to them, and the bed C is a tenth part of B. It is clear, therefore, how many beds equal a house—five. And that this is how exchange took place before there was money is clear; for it makes no difference whether it is five beds in return for a house, or the value of five beds.

We have said, then, what the unjust is and what the just is. And with these defined, it is clear that just action is a mean between doing injustice and suffering injustice; for the one involves having too much and the other having too little.

Justice is something in a mean, not in the same way as the other virtues but because it is [productive] of a mean, while injustice is so of the extremes. Also, justice is the state in accord with which the just person is said to do in action what is just, **1134a1** and to do so in accord with his deliberate choice; and to allocate things—whether to himself and another or to two other people—not in such a way that too much of what is choiceworthy goes to himself and too little to his neighbor, and the reverse with what is harmful, but rather the proportionally equal amount to both—and similarly where the allocation is to two other people.

Injustice, on the contrary, is [related in that way to] what is unjust, excess and deficiency of what is beneficial and what is harmful, contrary to what is proportional. Hence injustice is excess and deficiency because it is productive of excess and deficiency. In the case of those involved [in the exchange], this is an excess of what is unconditionally beneficial and a deficiency of what is harmful. In the case of third parties, it is generally the same, but it can be contrary to what is proportional in either of the two directions. In the case of an unjust action, getting too little is what constitutes suffering injustice, while getting too much constitutes doing injustice.

So much for justice and injustice, then, what the nature of each is, and similarly for what, in universal terms, is just and what unjust.

5.6
Political Justice

Since it is possible for someone to do injustice without yet being an unjust person, what sorts of unjust actions make someone who is already unjust, unjust with regard to a particular sort of injustice—for example, a thief, an adulterer, or a pirate? Or is that not at all the way in which actions differ? For someone might in fact have sex with a woman knowing who she is, but not because deliberate choice was the starting-point of his action but because feeling was. He is doing injustice, certainly, but he is not unjust—as, for example, someone is not a thief although he did steal, nor an adulterer although he did commit adultery, and similarly in the other cases.

We have previously said how reciprocity is related to the just. But we must not forget that we are inquiring about both the unconditionally just and the politically just. The latter is found where people share a communal life with a view to self-sufficiency and are free and equal, either proportionally or arithmetically. So those who are not like that have nothing politically just in their relations with each other, only what is just in a way and by a certain similarity. For there is justice only among people whose relations with each other are in fact subject to law, and law only among those where there is injustice. For justice is a judgment of what is just

and what is unjust. Where injustice exists among people, doing injustice also exists among them (although, where doing injustice exists among them, there is not always injustice), and doing injustice consists in allocating to oneself too many of the things that are unconditionally good and too few of those that are unconditionally bad.

That is why it is not a human being we allow to rule but reason, because a human being does so for himself and thus becomes a tyrant. A ruler by contrast is a guardian of what is just and, if of what is just, also of what is equal, since he seems never to get a greater share for himself, if indeed he is just (for he does not allocate a larger share of what is unconditionally good to himself, unless it is proportional to himself—which is why he seems to labor for someone else—and it is because of this that people say that justice is the good of another, as we also said earlier[82]). Therefore, some sort of recompense must be given to him, and this is honor and privilege. And someone to whom such things are not enough, these sorts of people become tyrants.

The just for a master of slaves or for a father is not the same as these other sorts but similar to them; for there is no injustice in relation to what is unconditionally one's own; and one's own possession or child, until it reaches a certain age and has been separated, is like a part of us. No one, however, deliberately chooses to harm himself. That is why there is no injustice in relation to oneself and therefore nothing politically unjust or politically just either; for it, we saw, is what is in accord with law and exists among those who are naturally subject to law, and these people are those to whom equality in ruling and being ruled belong. That is why the just is found more in relation to a wife than in relation to a child or possessions; for this is the just in a household; and it too is different from the politically just.

5.7
Natural Justice and Legal Justice

Of the politically just, one part is natural, the other legal. The natural one is the one that has the same force everywhere and not because it does or does not seem to have it, while the legal is the one where at the start it makes no difference whether it enjoins one thing or another, but once people establish it, it does make a difference—for example, that a mina is the amount of a ransom, or that a goat be sacrificed and not two sheep, and further, all the things about which one passes laws for particular cases (for example, that sacrifices be offered to Brasidas) and things passed by decrees.

It seems to some people that all cases of justice are like this, because what is by nature is unchangeable and has the same capacity everywhere, just as fire burns here and in Persia; while what is just they see as changing. This is not the case, however, but in a way it is. Among the gods, indeed, it is presumably not at all this way, but among us, while there is such a thing as what is by nature, everything is changeable

82. 1130a3.

all the same. Nonetheless, we do find here what is by nature and what is not by nature. But of the things that admit of being otherwise, it is clear what sort are by nature and what sort are not by nature but rather legal and by agreement, if indeed both are similarly changeable. And the same distinction will apply in other cases; for the right hand is by nature stronger, and yet it is possible for everyone to become ambidextrous.[83]

The sorts of things that are just by being in accord with convention and what is advantageous, however, are like measures; for measures for wine and for corn are not the same everywhere but are bigger in wholesale buying and selling and smaller in retail. Similarly too, things that are not naturally just but are human products are also not the same everywhere, since even constitutions are not the same everywhere, although only one is, in accord with nature, best everywhere.[84]

Each of the prescriptions that are just (that is, legal) is like a universal in relation to particulars; for the things that are done in action are many, but each prescription is one thing; for it is a universal. But an unjust action (*adikêma*) and what is unjust are different as are a just action (*dikaiôma*) and what is just; for what is unjust is so by nature or by constitutional arrangement, while the very same thing, when done, is an unjust action, but before it was done, it was not yet an unjust action but rather something unjust. It is the same way with a just action, although here the common sort is more usually called a *dikaiopragêma*, while it is the rectification of an unjust action that is called a *dikaiôma*.

Later we must investigate[85] each of these to see of what sorts their forms are, how many there are, and what they are concerned with.

5.8
Voluntary and Involuntary Justice and Injustice

Given that just and unjust actions are the way we said they are, a person does an unjust action (*adikei*) or a just action (*dikaiopragei*) when he does these voluntarily. But when he does them involuntarily, he does neither an unjust action nor a just action, except coincidentally; for people do in fact do actions that are coincidentally just or unjust.

But an unjust action, and a just action, are defined by the voluntary and involuntary; for it is when the action is voluntary that it is blamed, and it is then, at the same time, also an unjust action. So it is possible for something to be unjust without yet being an unjust action, unless voluntariness is present as well. What I mean by "voluntary," as was also said earlier,[86] is what is up to oneself and done knowingly—

83. †*MM* $1194^{b}33$–39.
84. *Pol.* $1293^{b}3$–7.
85. Perhaps a reference to a lost book of the *Politics* dealing with laws, or to *Rh.* 1.13–14.
86. $1111^{a}3$–19.

that is, not in ignorance of whom, with what, or for what's sake (for example, whom one is striking, with what, and for the sake of what), and where each of these is neither coincidentally so nor so by force. For example, if someone were to take the hand of another person and use it to strike a third, the second would not be acting voluntarily; for it was not up to him. It is also possible that the one being struck is his father, while the agent, while knowing that he is striking a human being or one of the people present, does not know that it is his father. Similar distinctions must also be made in the case of the for-the-sake-of-which and concerning the action as a whole.

What is done in ignorance, then, or not in ignorance but not up to the agent, or what is done by force, is involuntary. For there are in fact many natural processes that we either do or undergo knowingly, none of which are either voluntary or involuntary—for example, aging or dying.

Both unjust actions and just actions alike can also be coincidentally such; for in fact someone might return a deposit involuntarily and because of fear, and someone like that must not be said either to be doing what is just or to be doing a just action, except coincidentally. Similarly, one must also say that the person who fails to return a deposit, because he is under compulsion and acting involuntarily, is only coincidentally doing what is unjust or doing an unjust action. Among our voluntary actions, we do some having deliberately chosen them (the ones where there is prior deliberation), while we do others not having deliberately chosen them (the ones where there is no prior deliberation).

There are three sorts of harm, then, that are found in communities. Those involving ignorance are errors when the one affected by the action, what he is doing, the instrument, or the end is not as the agent thought; for he thought either that he was not hitting, or not with this, or not this person, or not for the sake of this, but, instead, the for-the-sake-of-which happened not to be as he thought (for example, he hit not in order to wound but in order to provoke) or not the person he thought or not with the instrument he thought.

When the harm is contrary to reasonable expectation, then, it is a stroke of bad luck. By contrast, when it is not contrary to reasonable expectation but involves no vice, it is an error (for someone commits an error when the starting-point of its cause is in himself, but it is a stroke of bad luck when the starting-point is outside him).

When an agent harms knowingly but without prior deliberation, it is an unjust action—for example, acts done because of spirit or other feelings that are necessary and natural to human beings; for people who do these sorts of harms and commit these sorts of errors are doing what is unjust, and their actions are unjust actions; however, they are not yet unjust or wicked because of this; for the harm was not done because of depravity. But when it is done as a result of deliberate choice, the agent is unjust and depraved.

That is why acts done as a result of spirit are correctly judged not to be premeditated; for their starting-point is not the agent who acts as a result of spirit but the one who made him angry. Further, the dispute is not about whether the event took place

or not but about what is just; for the anger is at an apparent injustice. For the parties are not disputing about whether the event took place or not, as in transactions, where—unless they are doing it because of forgetfulness—one of the parties must be depraved. Instead, the parties agree about the thing at issue, but dispute about whether the action was just or not (while the person who deliberately harms another is not ignorant about this), so that one party thinks he has been done an injustice, while the other denies it.

If a person harms as a result of deliberate choice, however, he acts unjustly, and it **1136ᵃ1** is already by doing these unjust actions that the unjust person is unjust, when they are contrary to what is proportional or to what is equal. Similarly, a person is just when he does just actions as a result of deliberate choice, while he does a just action if he merely does it voluntarily.

Some involuntary actions merit sympathetic consideration, while others do not merit sympathetic consideration. Errors that people make not only in ignorance but also because of ignorance merit sympathetic consideration, while when errors are made not because of ignorance but in ignorance caused by a feeling that is neither natural nor human, they do not merit sympathetic consideration.

5.9
Puzzles about Doing and Suffering Unjust Actions

Someone might raise some puzzles, however, about whether we have adequately defined what suffering an unjust action is and what doing an unjust action is. He might ask, first of all, whether things are as Euripides suggests in the strange lines:

> I killed my own mother: short the tale.
> A voluntary thing on both parts or an involuntary one?[87]

For is it really possible to suffer an unjust action voluntarily? Or is it impossible and, instead, always involuntary, just as doing an unjust action is always voluntary? And is it always one or the other or is it sometimes voluntary and sometimes involuntary?

It is the same way in the case of suffering a just action; for doing a just action is always voluntary, so that it is reasonable for there to be a similar opposition in either case and for suffering an unjust action and suffering a just action to be either something voluntary or something involuntary. But it would seem strange, even in the case of suffering a just action, if it were always voluntary; for some people suffer a just action involuntarily.

Next, we might also go through the following puzzle about whether every person who has suffered something unjust has suffered an unjust action or whether the case

87. From the lost *Alcmaeon* (referred to 1110ᵃ27–29), Fr. 68 Nauck. The first line is spoken by Alcmaeon, the second possibly by Phegeus.

of suffering one is just like the case of doing one; for it is possible to share coincidentally in what is just in both directions, and similarly, it is clear, in the case of what is unjust; for doing something that is unjust is not the same as doing an unjust action, nor is suffering something unjust the same as suffering an unjust action. It is the same way in the case of doing a just action and suffering a just action; for it is not possible to suffer an unjust action without someone's doing an unjust action or to suffer a just action without someone's doing a just action.

But if to do what is unconditionally an unjust action is to harm someone voluntarily; and if "voluntarily" means for someone to know the one affected, the instrument, and the way; and if the person who lacks self-control harms himself voluntarily; then he would voluntarily suffer an unjust action and it would be possible for someone to do an unjust action to himself. This is also one of the puzzles that are raised, whether it is possible for someone to do an unjust action to himself. Further, someone could, because of lack of self-control, be voluntarily harmed by someone else who was acting voluntarily, so that it would be possible to suffer an unjust action voluntarily.

Or is our definition incorrect, and to harming while knowing the one affected, the instrument, and the way, must we add against the wish of the one affected? Then someone is harmed and suffers unjust things voluntarily, but no one suffers an unjust action voluntarily; for no one wishes to suffer such an action, not even the person who lacks self-control, who instead acts contrary to his wish; for no one wishes for what he does not think to be excellent, and the person who lacks self-control does not do what he thinks he should do.

The person who gives away what is his own, as Homer says Glaucus gave to Diomedes "gold for bronze, a hundred oxen's worth for nine,"[88] is not suffering an unjust action. For to give is up to himself. To suffer an unjust action, however, is not up to himself; on the contrary, the person doing injustice must be present. As regards suffering an unjust action, then, it is clear that it is not voluntary.

Further, of the issues we deliberately chose to discuss, two remain, whether the person doing the unjust action is the one who allocates a larger share to someone contrary to his worth or is the one who has the larger share, and whether it is possible to do an unjust action to oneself. For if the first alternative is possible and it is the allocator who does the unjust action and not the one who has the larger share, then if someone knowingly and voluntarily allocates a larger share to someone else than he does to himself, this person does an unjust action to himself, which is precisely what moderate people seem to do; for the decent person tends to take less than his share. Or is it not that simple? For it may be that the decent person is getting a larger share of a different good—for example, of reputation or of what is unconditionally noble. Further, [the puzzle] is resolved by appeal to our definition of what it is to do an

88. Homer, *Iliad* 6.236.

unjust action.[89] For he suffers nothing contrary to his own wish, so that on these grounds at least he suffers no unjust action. Rather, if indeed he suffers anything, it is harm alone.

It is evident that the allocator of the larger share does in fact do an unjust action but that the person who has the larger share does not always do one; for it is not the person to whom the unjust share belongs who does the unjust action but the one who voluntarily does the unjust action, the one from whom, as the starting-point of the action, it derives, and the starting-point is in the allocator, not in the recipient.

Further, since *do* is said of things in many ways, and there is a way in which inanimate things do kill, and a hand and a servant under orders, though they do not do an unjust action, they do what is unjust.

Further, if the allocator gave his judgment in ignorance, he does not do an unjust action, according to the legally just, nor is his judgment unjust, although in a way it is unjust (for what is legally just is different from what is just in the primary way). However, if he knowingly gives an unjust judgment, he himself is getting more than his share either of favor or of revenge. The person, then, who has given an unjust judgment because of these things has also got more than his share, exactly as if he had gotten part of the proceeds of an unjust action. And in fact, having given the judgment about land on that condition, he got not land but money.

Human beings think that doing unjust actions is up to them. That is why they also think that the just is easy. But it isn't. Having sex with a neighbor's wife, striking someone standing nearby, or putting money in someone's hand is easy and is up to themselves. But doing them because of being in a certain state is not easy and not up to themselves.

In the same way people think that to know what is just and what is unjust we need not be at all wise, because the things the law pronounces about are not difficult to comprehend (but these do not constitute what is just except coincidentally). But knowing the way actions must be done and things must be allocated if they are to be just—that takes more work than knowing what things are healthy, since even in their case, while knowing that honey, wine, hellebore, cautery, and surgery are healthy things is easy, knowing the way these must be allocated with a view to health and to whom and when takes as much work as being a doctor.

Because of this very thing, they also think that to do unjust actions is no less characteristic of the just person than to do just ones, because the just person is no less—but even more—able to do each of these actions; for he too is able to have sex with a woman and strike blows, and the courageous person is able to throw down his shield and turn and run in this direction or that. But doing cowardly actions or unjust actions is not doing things of this sort except coincidentally; on the contrary, it involves being in a certain state when we do them. In the same way, doing medical

89. $1136^{b}3$–5.

actions or curing someone does not consist in performing a surgery or not performing one; or giving drugs or not giving them; but in doing them in a certain way.

What is just is found among people who have a share in unconditionally good things, who can have an excess of these or a deficiency; for, for some beings (as presumably for gods) there is no such thing as an excess of them, while for others (the incurably bad ones) no amount of them is beneficial but they are all harmful, and for yet others, they are beneficial up to a point. That is why the just is something human.

5.10
Decency

We must next say something about decency and the decent—about the way decency is related to justice and the way the decent is related to the just. For on investigation these appear to be neither unconditionally the same nor distinct in kind. Sometimes indeed we praise the decent and a man of this sort, so that we even transfer decent **1137b1** to other things we are praising in place of good, making it clear that the more decent is better. But sometimes, on following out the argument, it appears strange that the decent, if it is something beyond the just, must be something praiseworthy; for either the just is not something excellent or the decent is not just, if it is different from the just; or, if both are excellent, they are the same.

It is pretty much because of these considerations, then, that a puzzle arises about the decent. Yet in a way they are all correct and none is contrary to any of the others; for the decent, although better than what is in a certain way just, is still just and is not better than the just in the sense of being a thing of a distinct kind. After all, the same thing is just and decent, and while both are excellent, the decent is more excellent.

What produces the puzzle is that while the decent is just, it is not the just according to the law, but rather a rectification of the legally just. The cause of this is that all law is universal, but about some sorts of things it is not possible to pronounce correctly in universal terms. So in the sorts of cases where it is necessary to speak in universal terms but not possible to do so correctly, the law picks what holds for the most part, not unaware of the error involved. And it is no less correct for doing so; for the error is not in the law or in the legislator but in the nature of the thing at issue; for what is doable in action consists of this sort of subject matter from the outset. So whenever the law speaks universally and a particular case arises that is contrary to the universal, at that time it is correct (insofar as the legislator omits something and has made an error in pronouncing unconditionally) to rectify the deficiency—to say what the legislator himself would have said had he been present and would have ordained by law had he known about the case.

That is why the decent is just and better than what is in a certain way just. It is not better than the unconditionally just, however, but only better than the sort that, because it pronounces unconditionally, makes an error. And this is the very nature of the decent—a rectification of law insofar as it is deficient because of its universality.

For this is also the cause of not everything's being regulated by law, that there are some cases where it is impossible to establish a law, so that decrees are needed. For the standard of what is indeterminate is itself indeterminate, just like the lead standard[90] used in Lesbian-style building; for the standard is not fixed but adapts itself to the shape of the stone, and a decree adapts itself to the things.

What it is to be decent, then, and that it is both just and better than what is in a certain way just is clear. And it is also evident from this what the decent person is; for the person who is disposed to deliberately choose and to do these sorts of actions, and is not a stickler for justice in the bad way but takes less than his due even if he has the law on his side, is decent and his state is decency, which is a sort of justice and not some different state.

5.11
Doing Injustice to Oneself

Whether it is possible to do an unjust action to oneself or not is evident from what has been said.[91] For some just actions are the ones in accord with any virtue that are required by law—for example, the law does not allow the killing of oneself, and the things it does not allow, it forbids. Further, whenever, contrary to the law, someone harms another person, not in return for a harm, and does so voluntarily, he does an unjust action (and the one who does it voluntarily is the one who does it knowing the person affected and the instrument used). But the person who, because of anger, kills himself does this voluntarily, contrary to correct reason, and this the law does not allow. Therefore, he does an unjust action. But to whom? Or is it to the city, and not to himself? For he suffers it voluntarily, and no one suffers an unjust action voluntarily. That is why indeed the city imposes a penalty and why a certain dishonor attaches to a person who has done away with himself, on the supposition that he is doing something unjust to the city.

Further, insofar as the unjust agent is only unjust and not wholly base, it is not possible for him to do an unjust action to himself. (For this is different from the former case; for the person who is unjust in this way is wicked in the same way as a coward, not by possessing wickedness as a whole, and so it is also not in accord with it that he does the unjust action.) For that would be for the same thing to have been taken away from and added to the same person at the same time, and this is impossible. Rather, when something is just or when something is unjust, there must always be more than one person involved.

Further, an unjust action is voluntary, done from deliberate choice, and initiatory. For the person who acts because of something he suffered, and who does the same

90. Apparently a flexible lead device used to find a match for an irregularly shaped stone that was already set in position.

91. Presumably 1136^{a}10–1137^{a}1.

back, does not seem to do an unjust action. If he does it to himself, however, he is suffering and doing the same thing at the same time.

Further, it would be possible to suffer an unjust action voluntarily.

Besides, no one does an unjust action without doing one of the particular sorts of unjust action, and no one commits adultery with his own wife or breaks into his own house or steals his own property.

The puzzle about doing an unjust action to oneself is generally resolved, however, by reference to our definition[92] concerned with suffering an unjust action voluntarily.

It is evident too that both the doing of the unjust action and the suffering of the unjust action are base (for the second involves having less and the first having more than the mean, which is like health in the case of medicine, or good physical condition in that of athletic training). Nonetheless, the doing of the unjust action is worse; for doing an unjust action involves vice and is blameworthy, and the vice is either complete and unconditional or close to it (since not every voluntary unjust action involves injustice), while suffering an unjust action involves neither vice nor injustice. Intrinsically, then, suffering an unjust action is less base, but coincidentally there is nothing to prevent it from being a greater evil. But what happens coincidentally is of no concern to craft. Rather, it says that pleurisy is a worse malady than a stumble, and yet the latter might turn out to be coincidentally worse (if the stumbler, because of his fall, was captured or killed by his enemies).

By transference, though, and by similarity, what is just is found not in a person's relations to himself but among some of his parts—not what is just in every way but what is just in the way found in the mastery of slaves or in household management. For in these accounts the part of the soul that has reason is distinguished from the non-rational part. People look at these, indeed, and it seems to them that just actions can occur in a person's relations to himself, because it is possible for each of the parts to suffer things that are contrary to its own desires. So there is, then, something just in their relations with each other, like that between ruler and ruled.

As regards justice, then, and the others—the virtues of character—let them be defined in the foregoing way.

BOOK 6

6.1
Correct Reason and the Virtues of Thought

Since we have previously said that one must choose the mean, not the excess and not the deficiency, and the mean is as correct reason says, let us distinguish this. For in the case of all the states we have discussed, and as regards the others as well, there is

92. 1136b3–5, 23–25.

some target on which a possessor of the reason keeps his eye as he tightens or loosens, and there is some sort of defining mark of the mean states, which we say are between excess and deficiency, being in accord with correct reason.

But though this is true to say, it is not at all perspicuous; for even in the other sorts of supervision where there is scientific knowledge, it is true to say that one should exert oneself or relax neither too much nor too little but to a mean degree and as correct reason says. But someone having only this [account] would know nothing more, for example, as to what sorts of treatments to apply to the body, than if someone were to say that one should apply those that the craft of medicine prescribes and in the way the one who possesses this craft would. That is why, with regard to the states of the soul as well, we should not only assert this much of the truth but also determine what correct reason is and what its defining mark is.

In distinguishing the virtues of the soul we said[93] that some are virtues of character and some of thought. The virtues of character, to be sure, we have discussed. So let **1139ª1** us now speak about the others as follows, after first saying something about the soul. Previously, then, we said[94] that there are two parts of the soul, both one that has reason and one that lacks reason. Let us now divide in the same way the part that has reason. Let it also be assumed that there are two parts that have reason—one by which we get a theoretical grasp on those beings whose starting-points do not admit of being otherwise and one by which we do so on those that do admit of being otherwise; for where beings are distinct in kind, parts of the soul that are distinct in kind are naturally suited to each of them, if indeed it is on the basis of a certain similarity and kinship that they have knowledge.

Let us call one of these "the scientific part" and the other "the rationally calculative part"; for deliberating is the same as rationally calculating, and no one deliberates about what does not admit of being otherwise. So the rationally calculative part is one distinct part of the part that has reason.

Therefore, we must grasp what the best state of each of these parts is; for this is the virtue of each of them and the virtue relates to the proper work.

6.2
Action, Truth, and Deliberate Choice

Three things in the soul, indeed, control action and truth—perception, understanding, and desire. Of these, perception is not a starting-point of any action. This is clear from the fact that wild beasts have perception but do not share in action.

What affirmation and denial are in the case of thought, that, in the case of desire, is precisely what pursuit and avoidance are. So, since virtue of character is a

93. $1103^{a}3$–10.
94. $1102^{b}13$–$1103^{a}3$.

deliberately choosing state and deliberate choice is deliberative desire, it follows that both the reason must be true and the desire must be correct, if indeed the deliberate choice is to be an excellent one, and the very things the one must assert, the other must pursue. This, then, is practical thought and truth. In the case of thought that is theoretical, however, and neither practical nor productive, the good state and the bad state are truth and falsity (for that is the work of every part involving thought) but in the case of the part involving practical thought, the good state is truth in agreement with correct desire.

Of action, then, the starting-point—the source of the movement, not what it is for the sake of—is deliberate choice, and of deliberate choice, the starting-point is desire and reason that is for the sake of something. That is why, without understanding and thought, on the one hand, and a state of character, on the other, there is no deliberate choice; for there is no doing well in action or its contrary without thought and character. Thought by itself, however, moves nothing, but thought that is for the sake of something and practical does; for this even rules productive thought; **1139b1** for every producer produces for the sake of something, and what is producible is not unconditionally an end (as opposed to an end in relation to something and for something else) but what is doable in action is; for doing well in action is the end, and the desire is for it. That is why deliberate choice is either desiderative understanding or thought-involving desire, and this sort of starting-point is a human being.

Nothing in the past is an object of deliberate choice—for example, nobody deliberately chooses to have sacked Troy; for nobody deliberates about the past either, but rather about what is to happen in the future and what admits of being otherwise, and what is past does not admit of not having happened. That is why Agathon is correct:

> Of one thing alone is even a god deprived,
> To make undone what is done and finished.[95]

Of both of the parts that involve understanding, then, the work is truth. So the states in accord with which each most grasps the truth are, in each of the two cases, their virtues.

6.3
Scientific Knowledge

Let us start, then, from further back and speak again about these issues. Let the states, then, in which the soul grasps the truth by way of affirmation and denial be five in number: craft knowledge, scientific knowledge, practical wisdom, theoretical wisdom, and understanding; for supposition and belief admit of falsehood.

95. Fr. 5 Nauck.

What scientific knowledge is will be evident from the following, if one is to speak in an exact way and not be guided by mere similarities. For we all suppose that what we know scientifically does not at all admit of being otherwise, while in the case of things that do admit of being otherwise, whenever they fall outside our observation it escapes notice whether they hold or not. Therefore, what admits of being known scientifically is by necessity. Therefore, it is eternal; for the things that are unconditionally necessary are all eternal, and eternal things cannot come to be or pass away.

Further, each and every science seems to be teachable, and what can be known scientifically to be learnable. And it is from things already known that all teaching proceeds, just as we also say in the *Analytics*;[96] for some is through induction and some by deduction. Induction is clearly a starting-point of the universal as well, while a deduction proceeds from universals. Therefore, there are starting-points from which a deduction proceeds that are not reached by deduction. Therefore, induction [must provide them].

Therefore, scientific knowledge is a state affording demonstrations and has the other features included in the definition we give in the *Analytics*; for it is when someone is convinced in a certain way[97] and the starting-points are known to him that he has scientific knowledge; for if they are not better known than the conclusion, it is in a coincidental sense that he will have scientific knowledge.

Let scientific knowledge, then, be defined in this way.

6.4
Craft Knowledge

What admits of being otherwise includes both what is producible and what is doable in action. But production and action are different (about them we rely also on the external accounts), so that the practical state involving reason is also different from the productive state involving reason. And nor[98] is one encompassed by the other; for action is not production and production is not action. Since, then, building, for example, is one sort of craft and is precisely a productive state involving reason, and since there is no craft that is not a productive state involving reason and no such state that is not a craft, a craft would be actually the same as a productive state involving true reason. **1140^{a}1**

Every craft is concerned with coming to be, that is, with crafting things and getting a theoretical grasp on how something may come to be that admits of being and of not being and whose starting-point is in the producer but not in the product; for things that are or come to be by necessity are not the concern of craft, nor are things that are in accord with nature (for they have their starting-point within themselves).

96. *APo*. 71^{a}1–8.
97. *APo*. 72^{a}37–^{b}4, *Top*. 134^{a}34–35.
98. Reading καὶ.

Since, then, production and action are different, it is necessary that craft be concerned with production but not with action.

And in a certain way, craft and luck are concerned with the same things; as Agathon says, "Craft loves luck and luck craft."[99]

A craft, then, as we said, is some sort of state involving true reason concerned with production, and craft incompetence is the contrary, a state involving false reason concerned with production. Both are concerned with what admits of being otherwise.

6.5
Practical Wisdom

As regards practical wisdom, we might grasp it by observing what sort of people we say are practically wise. It seems, then, to be characteristic of a practically wise person to be able to deliberate correctly about what is good and advantageous for himself, not with respect to a particular area (for example, about what sorts of things further health or further strength) but about what sorts of things further living well as a whole. A sign of this is that we also speak of people as practically wise in some area, when they rationally calculate well about what furthers some excellent end, concerning which no craft exists. So in the case of the whole too it is the deliberative person who will be practically wise.

Also, nobody deliberates about things that cannot be otherwise or about things that cannot be done in action by himself. So, if indeed scientific knowledge involves demonstration, and the things whose starting-points admit of being otherwise cannot be demonstrated (for all of them also admit of being otherwise) and it is not possible to deliberate about what holds by necessity, practical wisdom cannot be either scientific knowledge or craft knowledge—not scientific knowledge because what is doable in action admits of being otherwise, not craft knowledge because action and production are distinct in kind. Therefore, the remaining possibility is for practical wisdom to be a true state involving reason, a practical one, concerned with what is good or bad for a human being. For the end of production is something other than production, while that of action is not something other than action; for doing well in action is itself action's end.

That is why we think Pericles and people of that sort to be practically wise—because they are capable of getting a theoretical grasp on what is good for themselves and for human beings, and we regard household managers and politicians to be of this sort.

That is also why we call temperance (*sôphrosunê*) by this name, as being what preserves practical wisdom (*sôzousan tên phronêsin*). And it does preserve this sort of supposition. For the pleasant and painful do not destroy or distort every sort of

99. Fr. 6 Nauck.

supposition (for example, that triangles do or do not contain two right angles) but the ones about what is doable in action. For the starting-points of things doable in action are the [end] that the things doable in action are done for the sake of. But once someone is destroyed by pleasure or pain, to him this does not appear a starting-point or that it is for the sake of it and because of it that one should choose and do everything; for vice is destructive of the starting-point. So it is necessary for practical wisdom to be a true practical state involving reason, concerned with human goods.

Of craft knowledge there is certainly a virtue, while of practical wisdom there is not one. And, in the case of a craft, the person who makes errors voluntarily is preferable, while in the case of practical wisdom it is not so, as is also the case with the virtues. It is clear, then, that it is some sort of virtue and not a craft.

Since there are two parts of the soul that have reason, however, it would be a virtue of one of them, the part that forms beliefs; for both belief and practical wisdom are concerned with what admits of being otherwise.

But surely it is not a state involving reason only. A sign of this is that there is forgetfulness of a state like that, but of practical wisdom there is not.

6.6
Understanding

Since scientific knowledge is supposition about universals and things that are by necessity, and since there are starting-points of what can be demonstrated, and so in all sciences (for scientific knowledge involves reason), about the starting-point of what is scientifically knowable there can be neither scientific knowledge nor craft knowledge nor practical wisdom; for what is scientifically knowable is demonstrable, while the other two deal with what admits of being otherwise.

Nor, then, is there theoretical wisdom of these; for it is characteristic of the theoretically wise person to have a demonstration of certain things. **1141^{a}1**

If, then, the states by which we grasp the truth and never have false views about what cannot—or even can—be otherwise are scientific knowledge, practical wisdom, theoretical wisdom, and understanding, and it cannot be any of the three of these (by "the three" I mean practical wisdom, scientific knowledge, and theoretical wisdom), the remaining alternative is for understanding to be of starting-points.

6.7
Theoretical Wisdom and Practical Wisdom

Wisdom in crafts we ascribe to the most exact practitioners of their crafts (for example, calling Phidias "a wise sculptor in stone" and Polyclitus "a wise sculptor in bronze"), here signifying nothing else by wisdom, indeed, than that it is a virtue of

craft knowledge. There are, however, some people we think are wise about things as a whole, not wise in some area or wise in some other particular way, as Homer says in the *Margites*:

> him the gods made neither a digger nor a plowman
> nor wise in any other particular way.

So it is clear that theoretical wisdom must be the most exact of the sciences.[100]

Therefore, the theoretically wise person must not only know what follows from the starting-points but must also grasp the truth concerning the starting-points. So theoretical wisdom would be understanding plus scientific knowledge—scientific knowledge, having a head, as it were, of the most estimable things. For it would be strange if someone thinks that politics or practical wisdom is most excellent, unless the best thing in the universe is a human being.

If, then, what is healthy and good is different for human beings and fish, while what is white and straight is always the same, everyone would say that what is theoretically wise is the same but that what is practically wise is different; for the one who has a theoretical grasp of each matter concerning his own good is the one [human beings] would call "practically wise," and it is to him that they would entrust such matters. That is why even some of the wild beasts are said to be practically wise—those that appear to have a capacity for forethought about their life.

It is evident too that theoretical wisdom and politics cannot be the same thing; for if people are to call the science that deals with what is beneficial to themselves "theoretical wisdom," there will be many theoretical wisdoms; for there will not be one dealing with the good of all animals but a different one dealing with each [sort], unless there is in fact one science of medicine for all beings. And if human beings are the best of the other animals, it makes no difference; for in fact there are other things that are far more divine in nature even than human beings—for example, the most manifest ones, those from which the cosmos is composed.

From what has been said, then, it is clear that theoretical wisdom is both scientific knowledge and understanding of the things that are by nature most estimable. That is why people say that Anaxagoras and Thales and others of that sort are wise but not practically wise when they see them ignorant of what is advantageous to themselves, and yet they say these men know what is extraordinary, wondrous, difficult, and daimonic, yet useless, because it is not human goods they seek.

Practical wisdom, on the other hand, is concerned with human affairs and what can be deliberated about; for of the practically wise person we say that this most of all is the work: to deliberate well. And nobody deliberates about what cannot be otherwise, or about such things as have no end at all that is a good doable in action. The unconditionally good deliberator, however, is the one capable of aiming at and

100. *APo*. 87a31–37.

hitting, in accord with rational calculation, the best for a human being of things doable in action.

Nor is practical wisdom of universals only. On the contrary, it must also know the particulars; for it is practical, and action is concerned with particulars. That is why even some people who lack knowledge, especially those with experience in other areas, are more effective doers of action than are others who have knowledge; for if someone knows that light meats are digestible and healthy but is ignorant about which sorts of meat are light, he will not produce health; but the one who knows that bird meats are healthy will produce health more. But practical wisdom is practical, so one must possess both sorts of knowledge—or this one more.

But here too there will be a sort that is architectonic.

6.8
Practical Wisdom and Politics

Politics and practical wisdom are the same state; however, the being for them is not the same. One sort of practical wisdom concerned with the city is the architectonic part, legislative science, while the part concerned with particulars has the name common to both: "politics." This part is practical and deliberative; for the decree is doable in action, as the last thing. That is why only these people are said to take part in political activity; for it is only they who do things in just the way handicraftsmen do.

It also seems that practical wisdom concerned with oneself as an individual is most of all practical wisdom, and it is this that has the name common to all the sorts, practical wisdom. Among the other sorts, one is household management, another legislative science, another politics, and of the latter, one part is deliberative and the other judicial.

Knowledge of what is good for oneself would certainly be one form of knowledge; but it admits of much difference.

Also, it seems that the person who knows about and spends his time on the things that concern himself is practically wise and that politicians are busybodies. That is why Euripides says:

> How can I be practically wise, when I could have minded my own business,
> And been numbered among the ranks of the army,
> sharing equally?
> For those who aim too high and occupy themselves too much. . . .[101]

For people seek what is good for themselves and think that this is what one should do. From this belief, then, has come the view that such people are the ones with practical wisdom. And yet a person's own welfare cannot be achieved, presumably,

101. *Philoctetes*, Fr. 787–788 Nauck.

without household management or without a constitution. Further, how the things that pertain to his own welfare are to be managed is unclear and must be investigated.

A sign of what has been said is that while young people become geometers and mathematicians and wise in such things, [a young person] does not seem to become practically wise. The cause is that practical wisdom is concerned also with particulars, which become known from experience. But a young person is not experienced; for it is quantity of time that produces experience. Also, one might investigate why it is that a child clearly can become a mathematician but cannot become a theoretically wise person or a natural scientist. Or isn't it that the objects in mathematics are given through abstraction, while the starting-points in theoretical wisdom or natural science come from experience, so that the young lack conviction there but only talk the talk, while in mathematics it is quite clear to them what each of the objects is?

Further, the error in deliberation might be either about the universal or about the particular; for [one might be in error about the fact] that all heavy sorts of water are bad or that this particular water is heavy. But that practical wisdom is not scientific knowledge is evident; for it is concerned with the last thing, as we said;[102] for what is doable in action is of this sort. It stands opposed, then, to understanding; for understanding is of the terms for which there is no reason, but practical wisdom concerns the last thing, of which there is not scientific knowledge but rather perception—not the perception of special objects but like the sort by which we perceive that the last thing among mathematical objects is a triangle; for it will stop there too. But this is more perception than practical wisdom, although of another form than that.

6.9
Good Deliberation

Inquiry and deliberation are different; for deliberation is inquiry of a certain sort. But we must also grasp what good deliberation is, whether some sort of scientific knowledge or belief or good guesswork or some other kind of thing.

Scientific knowledge it certainly isn't; for people do not inquire about things they **1142b1** know. But good deliberation is a sort of deliberation and a deliberator inquires and rationally calculates. But surely it is not good guesswork either; for good guesswork, indeed, is without reason and is also something quick, while one deliberates for a long time. And they say that though we should act quickly on the results of our deliberation, we should deliberate slowly.

Further, acumen is different from good deliberation, and acumen is a sort of good guesswork.

Neither, indeed, is good deliberation any sort of belief. On the contrary, since a bad deliberator makes an error and a good one deliberates correctly, it is clear

102. 1141b14–15, 25–28.

that good deliberation is some sort of correctness—correctness neither of scientific knowledge nor of belief; for of scientific knowledge there is no correctness (for there is no error either), and of belief correctness is truth. At the same time, everything about which there is belief is already determined. But, surely, without reason there is no good deliberation either.

Therefore, it remains for it to be correctness of thought; for thought is not yet affirmation; for in fact belief is not inquiry but already a sort of affirmation, while a deliberator, whether he deliberates well or badly, is inquiring about something and rationally calculating.

But good deliberation is a certain sort of correctness of deliberation. That is why we must inquire first what deliberation is and what it concerns. Since correctness is of more than one sort, however, it is clear that deliberation's correctness will not be any and every sort; for the person who lacks self-control or the base person will, if he is clever,[103] reach as a result of rational calculation what he proposes to do, so that he will have deliberated correctly but will have gotten hold of a great evil. But it seems to be a good thing to have deliberated well; for it is this sort of correctness of deliberation that is good deliberation—the sort that is able to gain a good.

One can, however, also reach this by a false deduction—that is, reach the thing one should do but not by the means one should, the middle term being false. So this is not yet good deliberation—where one reaches what should be done, yet not by the means one should.

Further, one person may deliberate a long time to reach it, while another does so quickly. The former, then, is not yet a case of good deliberation, which is correctness in accord with what is beneficial and about what to do, how to do it, and when to do it.

Further, it is possible to deliberate well either unconditionally or in relation to a particular end. Unconditionally good deliberation correctly furthers the unconditional end, the particular sort, some particular end. If it is characteristic of practically wise people to have deliberated well, then good deliberation will be the sort of correctness that is in accord with what is advantageous in furthering the end about which practical wisdom is the true supposition.

6.10
Comprehension

Comprehension and good comprehension—those states by which we say people comprehend or comprehend well—are not, in general, the same as scientific knowledge nor as belief (for if they were, everyone would have comprehension), nor are **1143ª1** they any one of the sciences dealing with a particular area, as medicine is concerned

103. Reading εἰ δεινός.

with healthy things, geometry with magnitudes. For comprehension is not concerned with what always is and is unchanging, nor is it concerned with just any of the things that come to be but with those one might puzzle and deliberate about. That is why it is concerned with the same things as practical wisdom, although comprehension is not the same as practical wisdom. For practical wisdom is prescriptive (for what should be done or not is its end), while comprehension is an ability to judge only. (For comprehension and good comprehension are the same, as are those with comprehension and those with good comprehension.)

Comprehension is neither having practical wisdom nor acquiring it. Comprehension is neither having practical wisdom nor acquiring it. But just as learning is said to be comprehending whenever someone is using scientific knowledge, it is also so called whenever someone is using belief to judge—and judge correctly—about matters with which practical wisdom is concerned, when someone else is speaking of them. For judging well is the same as judging correctly. And this is where the name "comprehension" (*sunesis*)—in the sense of what makes people have good comprehension (*eusunetoi*)—came from, the comprehension involved in learning; for we often call learning "comprehending."

6.11
Consideration, Understanding, and Practical Wisdom

What is called "consideration" (*gnômê*), due to which people are said to be sympathetically considerate (*sungnômones*) and to have consideration, is the correct judgment of what is decent. A sign of this is that we say that it is the decent person, above all, who is sympathetically considerate, and that to be decent in certain cases is to be sympathetically considerate. Sympathetic consideration, then, is the correct consideration that judges matters of what is decent. And the correct sort of consideration is of that which is true.

All these states are reasonably taken to tend in the same direction; for we attribute consideration, comprehension, practical wisdom, and understanding to the same people and say they actually have consideration and understanding when they are practically wise and comprehending. For all these capacities are concerned with things that come last, that is, particulars. And it is especially in being able to judge in matters with which the practically wise person is concerned that one is comprehending and sympathetically considerate; for what is decent is the common concern of all good people in relation to another. And all the things doable in action are among particulars—that is, the things that come last; for the practically wise person must also know these, and comprehension and consideration are concerned with things doable in action; and these are things that come last.

Also, understanding is concerned with things that come last in both directions; for concerning both the primary terms and the things that come last, there

is understanding but not reasoning—that is to say, on the one hand, in the case of demonstrations, understanding is of the unchanging and primary terms; on the **1143^{b}1**
other hand, in the case of those that are practical, it is of the last thing and the one that admits of being otherwise and the other premise; for these are starting-points of the for-the-sake-of-which, as it is from particulars that universals come. So of these we must have perception, and this is understanding. {That is why understanding is 5
both starting-point and end; for demonstrations are from these and concerned with 10
these.}[104]

That is why these things even seem to be natural—and why, while nobody seems wise by nature, people do seem to have consideration, comprehension, and understanding by nature. A sign of this is that we also think these states correspond to the stages of life and that a particular stage brings understanding and consideration, as if nature were the cause. {. . .}[105] So one should attend to the undemonstrated sayings 9–11
and beliefs of experienced and older people or practically wise ones, no less than to the demonstrations; for because they have an eye formed from experience they see correctly.

We have said, then, what practical wisdom and theoretical wisdom are, what each of them is concerned with, and that each is the virtue of a different part of the soul. 15

6.12
Practical Wisdom, Theoretical Wisdom, and Cleverness

One might, however, go through some puzzles about what these virtues are useful for. For theoretical wisdom will not have a theoretical grasp on any of the things from which a human being will come to be happy (for it is not concerned with anything's coming to be), and while practical wisdom does have this grasp, what does one need 20
it for? For if practical wisdom is indeed the virtue concerned with things just and noble and good for a human being, and these are the ones it is characteristic of a good man to do, knowledge of them, however, in no way makes us more likely to do them (if indeed states are what the virtues are). Then it will be exactly the same as in the case of things relating to health or things relating to good physical condition (I 25
mean those so called not for producing the state but for resulting from it); for we are in no way more likely to do them because of knowing medicine or physical training.

If, on the other hand, we are to say that being practically wise is not useful for this but for becoming [good], to those who are excellent it would be of no use. Further, it would be of none to those who do not have it; for it will make no difference whether they have it themselves or they put their trust in others who have it. And this 30

104. Transposed from 1143^{b}9–11.
105. Read following 1143^{b}5.

would be enough for us just as in the case of health; for while we wish to be healthy, nonetheless, we do not learn medicine.

In addition to these considerations, it would seem strange if practical wisdom, though inferior to theoretical wisdom, were to have more control than it; for what produces each thing also rules and issues prescriptions concerning it. About these issues, then, we must speak; for so far we have only raised the puzzles relating to them.

1144a1 First of all, let us state that these states must certainly be intrinsically choiceworthy (for each is the virtue of one of the two parts [that have reason]) even if neither of them produces anything at all.

Next, they do indeed produce something; not, however, as medicine produces health, but as health does.[106] That is also how theoretical wisdom produces happiness; for as a part of virtue as a whole, by being possessed and activated, it makes a person happy.

Further, our work is completed in accord with practical wisdom and virtue of character; for virtue makes the target correct, while practical wisdom makes what furthers it correct. Of the fourth part of the soul, the nutritive, there is no virtue of this sort; for there is no action that is up to it to do or not do.

With regard to our being in no way more likely to do noble actions and just actions because of practical wisdom, let us start a little further back, taking the following as a starting-point. For we also say that some people who do just things are still not just (for example, those who do what is prescribed by the laws either involuntarily, because of ignorance, or because of something else, and not because of the actions themselves), and yet they at least do the actions one should do, and those the excellent person must do. Likewise, so it seems, it is possible for someone to do each sort of action by being in the sort of state that makes him a good person—I mean, for example, to do them because of deliberate choice and for the sake of the actions themselves.

Virtue, then, makes the deliberate choice correct, but as to whatever should naturally be done for the sake of carrying it out—that is not the business of virtue but of a different capacity. However, we must get scientific knowledge of these things and discuss them in a more perspicuous way.

There is, indeed, a capacity they call "cleverness," and this is the sort of thing that, when it comes to the things that further hitting a proposed target, is able to do these and to hit upon them.[107] If, then, the target is a noble one, this capacity is praiseworthy, but, if it is a base one, it is unscrupulousness. That is why we call both practically wise people and unscrupulous ones[108] "clever." Practical wisdom, however, is not the capacity of cleverness but does not exist without this capacity.

But the state, the one pertaining to this eye of the soul, does not come about without virtue, as we have said and as is clear; for practical deductions have a starting-point, since

106. *Rh.* 1362a31–34.
107. Reading αὐτῶν.
108. Reading τοὺς πανούργους.

the end—that is, what is best—is such-and-such, whatever it may be (let it be any random thing for the sake of argument); this, however, is not apparent except to the good person; for depravity produces distortion and false views about practical starting-points. So it is evident that it is impossible to be practically wise without being good.

6.13
Natural Virtue, Virtue in the Strict Sense, and Practical Wisdom

Virtue, then, must also be investigated again; for virtue is also much the same way: **1144b1** as practical wisdom is related to cleverness—not the same but similar—so natural virtue is related to virtue in the strict sense. For everyone thinks that each character trait is possessed in some way by nature; for we are in fact just, disposed to temperance, courageous, and have the rest of them straight from birth. Nonetheless, we seek something else as what is fully good and for such qualities to be possessed in another way. For to both children and wild beasts these natural states also belong; but without understanding they are manifestly harmful. Besides, this much we can surely see: that just as a heavy body moving around without sight suffers a heavy fall because it has no sight, so it happens in this case too.

But if someone acquires understanding, it makes a difference in his action; and his state, though similar to the one he had, will then be virtue in the strict sense. So, just as in the case of the part that forms beliefs there are two forms of condition (cleverness and practical wisdom), so also in the part responsible for character there are two (natural virtue and virtue in the strict sense), and of these, virtue in the strict sense does not come into being without practical wisdom.

That is why indeed some people say that all the virtues are sorts of practical wisdom and why, in one respect, Socrates used to inquire correctly but, in another, erroneously; for in thinking that all the virtues were sorts of practical wisdom, he was in error, but in saying that they did not exist without practical wisdom, he spoke correctly.

There is a sign of this; for even now everyone, when defining virtue and having named the state and what it is concerned with, adds "the one in accord with correct reason"—and correct is what is in accord with practical wisdom. It would seem, then, that all people somehow divine that this sort of state is virtue—the one in accord with practical wisdom.

We, however, should go a little further. For virtue is not merely the state that is in accord with correct reason but the one that also involves correct reason. And correct reason about such matters is practical wisdom. Socrates, then, thought that the virtues were cases of reason (all being cases of scientific knowledge),[109] while we think that they involve reason.

109. E.g., Plato, *Laches* 199a–b.

It is clear, then, from what we have said, that it is not possible to be either fully good without practical wisdom or practically wise without virtue of character. Moreover, in this way we can also resolve the argument by which someone might contend dialectically that the virtues are separate from each other; for the same person is not naturally well-disposed in the highest degree concerning all of them, so that he will at some point have acquired one when he has not yet acquired another. In the case of the natural virtues, indeed, this is possible, but in the case of those in accord with which someone is called "unconditionally good," it is not possible; for at the same time as the one, practical wisdom, is present, they will all be present.

And it is clear that even if practical wisdom were not concerned with action, we would need it because it is the virtue of a part [of the soul]; clear too that deliberate choice will not be correct without practical wisdom or without virtue; for virtue makes us do the actions that the end consists in, while deliberate choice makes us do the actions that further it.

But yet it does not control either theoretical wisdom or the better part any more than medicine controls health; for it does not use it but sees to its coming into being. So it prescribes for its sake, not to it. Besides, it would be like saying that politics rules the gods, because it prescribes with regard to everything in the city.

BOOK 7

7.1
Beastliness, Lack of Self-Control, Method

Next, we must make a fresh start and say that the things having to do with character that are to be avoided are of three forms: vice, lack of self-control, and beastliness. It is clear what the contraries of two of these are; for we call the one "virtue" and the other "self-control." As regards the contrary of beastliness, it would be most fitting to speak of a virtue that is beyond us, one of a heroic and divine sort—as when Homer has Priam say that Hector was exceptionally good: "nor did he even seem the son of a mortal man, but rather of a god."[110] So if, as they say, human beings become gods because of an excess of virtue, it is clear that the state opposed to the sort that is beast-like will be of this sort. And just as there is in fact neither vice nor virtue of a wild beast, neither is there of a god. But his state is more estimable than virtue, while that of a wild beast is of another kind than vice.

And since a divine (*theios*) man (as the Spartans tend to call someone they particularly admire, when they say in their dialect that he is a "*seios* man") is a rare thing, so the beast-like sort is also rare among human beings. It occurs most among barbarians,

110. Homer, *Iliad* 24.258–259.

although some cases in fact come about because of disease or disabilities. We also use "beast-like" as a term of abuse for those who exceed human beings in their vice. But about this disposition we will have to make some mention later on; about vice we spoke earlier.[111]

But about lack of self-control and softness (or effeminacy), we must now speak, as well as about self-control and resilience; for we must not suppose that either of the two is concerned with the same states as virtue and depravity or that they are of another kind than virtue and depravity.

We must, as in the other cases, set down the things that appear to be so and first go through the puzzles, and in that way prove preferably all the acceptable beliefs about these affections, or if not all of them, then most of them, and the most authoritative ones; for if the objections are resolved and the acceptable beliefs are left standing, that would be an adequate proof.

Both self-control and resilience seem to be among the excellent things and praiseworthy ones, while lack of self-control and softness seem to be among the base and blameworthy ones.

Also, the self-controlled person and the one who is disposed to stand by his rational calculation seem to be the same, as do the person who lacks self-control and the one who is disposed to depart from his rational calculation. And the person who lacks self-control, knowing that what he does is base, does it because of feeling, while the one who has self-control, knowing that his appetites are base, does not follow them, because of his reason.

Also, some people say that the temperate person is self-controlled and resilient, some saying that all of the latter sort are temperate, others that they are not, but all also saying that the intemperate person lacks self-control and that the one who lacks self-control is intemperate, lumping both together. Others, however, say these sorts of people are different. Sometimes they say that it is impossible for a practically wise person to lack self-control, although sometimes they say that some people who are practically wise and clever do lack self-control.

Further, people are said to lack self-control also in relation to spirit, honor, and profit.

These, then, are the things that are said.

7.2
Puzzles about Lack of Self-Control

Someone might be puzzled about what sort of correct supposition one has when one acts without self-control.

111. 1148[b]18–24 (beast-likeness), Books 3–4 (vice).

Some people say, certainly, that when one has scientific knowledge, it is not possible; for it would be terrible—as Socrates used to think[112]—if, when scientific knowledge is present, something else is in control and drags it around like a slave. For Socrates used wholly to combat this account, on the supposition that there is no such thing as lack of self-control; for no one, while supposing that he is doing so, acts contrary to what is best but acts that way only because of ignorance.

This argument certainly contradicts what plainly appears to be the case, and so we must inquire about the affection of the person who lacks self-control, if he acts because of ignorance, as to what manner of ignorance it turns out to be. For before he is affected, at any rate, it is evident that an agent acting without self-control does not think that he should do the action.

There are some people who grant some, but not other, parts of this; for they agree that nothing is stronger than scientific knowledge but do not agree that no one acts contrary to what he believes to be better and, because of this, they say that it is not when the person who lacks self-control has scientific knowledge that he is controlled by pleasures but when he has belief.

But surely, if indeed it is belief, not scientific knowledge, and it is not a strong supposition that is resisting but a weak one, like that found in people who are in doubt, there will be sympathetic consideration for failure to stand by such beliefs in the face of strong appetites. But for depravity there is no sympathetic consideration, nor for any other blameworthy thing.

What, then, if practical wisdom is what is doing the resisting? For it is strongest. But that would be a strange thing; for the same person would be at the same time practically wise and lacking in self-control, and no one would say that it is characteristic of a practically wise person to do the worst actions voluntarily. Besides, it was proved earlier[113] that a practically wise person is indeed a doer of action (for he is concerned with last things) and has the other virtues.

Further, if someone cannot be self-controlled unless his appetites are strong and base, the temperate person will not be self-controlled nor the self-controlled one temperate; for it is not characteristic of the temperate person to have appetites that are too strong or ones that are base. Yet they must be both; for if his appetites are good, the state that prevents him from following them must be base, so that not all self-control will be excellent; on the other hand, if they are weak and not base, self-control will be nothing very wonderful, while if they are base and weak, it will be nothing great.

Further, if self-control makes one disposed to stand by every belief, it is base—for example, if it makes him do so even when the belief is false. Also, if lack of self-control makes a person disposed to depart from every belief, there will be a sort of lack of self-control that is excellent—for example, Neoptolemus in Sophocles'

112. Plato, *Protagoras* 352b–c.

113. 1141b14–22, 1143a25–35, 1144a34–b1, 1144b30–1145a6.

Philoctetes. For he is praiseworthy for not standing by what Odysseus persuaded him to do, because it pains him to tell a falsehood.

Further, a certain sophistical argument constitutes a puzzle; for because [sophists] wish to refute people in unacceptable ways, in order to be clever when they engage in argumentative encounters,[114] the resulting deduction turns into a puzzle; for thought is tied up when it does not wish to stand still, because what has been concluded is not pleasing, but cannot move forward, because of its inability to resolve the argument. It follows from a certain argument, then, that foolishness combined with lack of self-control is virtue; for due to lack of self-control one does what is contrary to what one supposes one should, but since one supposes that bad things are good and that one should not do them, one will do the good ones and not the bad ones.

Further, the person who, by being persuaded, does or pursues pleasant things, deliberately choosing so would seem to be better than the one who does so not because of rational calculation but because of lack of self-control; for the first one is more easily cured, because he might be persuaded to act otherwise, while the person who lacks self-control is subject to the proverb: "When water is choking you, what will wash it down?" For if he had been persuaded to do what he is doing, he would have stopped if he was persuaded to act otherwise. As things stand, however, persuaded of one thing, he nonetheless does the other.[115]

Further, if there is lack of self-control and self-control concerning all things, who is it that is unconditionally lacking in self-control? For no one has every sort of lack of self-control, yet we do say that some people are unconditionally such.

These, then, are the sorts of puzzles that arise, and thus some things must be confuted, others left standing; for the resolution of a puzzle constitutes a discovery.

7.3
Lack of Self-Control and Knowledge

We must investigate first, then, whether the person who lacks self-control acts knowingly or not and in what way knowingly, and next, what sorts of things we must take the person who lacks self-control and the person who has it to be concerned with (I mean, whether they are concerned with every sort of pleasure and pain or with some determinate sorts), and whether the self-controlled person and the resilient one are the same or different; and similarly as regards other matters germane to this theoretical investigation.

The starting-point of the investigation is whether the person who has self-control and the person who lacks it differ in the things they are concerned with or in the way they are concerned with them—I mean, whether the person who lacks self-control

114. Reading ἐντύχωσιν.
115. Reading νῦν δὲ πεπεισμένος ἄλλα οὐδὲν ἧττον ἄλλα πράττει.

lacks it solely by being concerned with these particular things or solely by the way he is concerned with them, or not solely by either of these, but because of both. Next, whether there is lack of self-control and self-control concerning all things, or not. For the person who unconditionally lacks self-control is not concerned with all things, but rather with the very same ones as the intemperate person. Nor does he lack self-control by being unconditionally related to these (for then it would be the same as intemperance), but rather by being related to them in a certain way. For the intemperate person is led on by deliberate choice, thinking that he should always pursue the present pleasure, while the one who lacks self-control does not think this but pursues it anyway.

As regards the view that it is true belief and not scientific knowledge that people who act without self-control act contrary to, this makes no difference to the argument; for some people with belief are not in doubt but think they have the most exact knowledge. If, then, it is because of the weakness of their conviction that those with belief are more likely than those with scientific knowledge to do actions contrary to their supposition, scientific knowledge will be no different here from belief; for some people have no less conviction about what they believe than others do about what they know scientifically—something Heraclitus makes clear enough.[116]

But since we speak of knowing scientifically in two ways (for both the person who has but is not using his scientific knowledge and the one who is using it are said to know scientifically), there will be a difference between having knowledge while not actively contemplating and having knowledge while actively contemplating the actions one should not do (for this is what seems bizarre, although not if one is not actively contemplating them).

1147a1 Further, since there are two modes of premises, nothing in fact prevents the person who has both from acting against his scientific knowledge, provided he makes use of the universal one, but not of the particular one; for the particular ones are what are doable in action. And there is also a difference in what is universal; for one applies to the agent himself and the other to the thing—for example, that dry foods are advantageous for every human being and that he himself is a human being, or that such-and-such sort of food is dry. But that this is of such-and-such sort, he either does not have or is not activating. Between these ways, then, there is an enormous difference, so that for him to know in the way described seems not at all strange but, in the other way, amazing.

Further, human beings can have scientific knowledge in a way other than the ones we have just described; for among those who have but are not using it we see a difference in the having of the state, so that someone both has it in a way and does not have it—for example, if he is sleeping, mad, or tipsy. But surely this is the way people who are indeed in the grip of their feelings are disposed; for spirited feelings, sexual appetites, and some things of this sort clearly alter the condition of the body as

116. †*MM* 1201b5–9.

well and in some people even produce states of madness. Clearly, then, we must say that people who lack self-control are in a state similar to these people.

But the fact that they talk the talk that stems from scientific knowledge signifies nothing; for those in the grip of these feelings can even recite demonstrations and verses of Empedocles. And those who have first learned something string the words together but do not yet know what they have learned; for it must grow to be a natural part of them, and that takes time. So we must suppose that those acting without self-control in fact speak like actors on a stage.

Further, we might look into the cause of acting without self-control by appealing to natural science as follows. For one belief is universal, while the other is concerned with particulars, which perception already controls. But when a single belief comes about from these, the soul, in one sort of case, necessarily affirms what has been concluded, while in productive cases it acts straightaway. For example, if everything sweet should be tasted and this (as one of the particulars) is sweet, it is necessary for the person who is able and not prevented also to do it at once. Whenever, then, one universal premise is in the agent preventing tasting, as well as another (that everything sweet is pleasant) and this is sweet (and this one is active) and there happens to be an appetite in him, the one premise says, avoid this! but the appetite leads him on (for it is capable of moving each of the parts), the result is that from reason, in a way, and from belief, he acts without self-control. The belief, however, is not intrinsically, but coincidentally, contrary to correct reason (for what is contrary is the appetite, not the belief).

(So it is also because of this that wild beasts do not lack self-control, that they do not have a universal supposition but only imagination and memory of particulars. As for how the ignorance of an agent who lacks self-control is resolved and he recovers his scientific knowledge, the account is the same as in the case of a tipsy person and a sleeping one and is not special to this way of being affected; it is one we must hear from the natural scientists.[117])

Since the final premise both is a belief about something perceptible, however, and controls actions, either an agent does not have this when he is being affected or he has it in such a way as to have not scientific knowledge of it but to talk the talk, like a tipsy person with the verses of Empedocles. And because the last term is not universal and does not seem to be scientifically knowable in the way the universal is, even the result Socrates was seeking would seem to come about; for neither is it scientific knowledge in the strict sense that seems to be actively present when this way of being affected comes about, nor is it what is dragged around because of feeling, but rather the perceptual sort.

So much, then, for knowing and not knowing and for how it is possible to know and yet to act without self-control.

117. *MA* 11.

7.4
Unconditional Lack of Self-Control

We must next discuss whether there is anyone who unconditionally lacks self-control (or whether all people who lack self-control do so partially), and if there is, concerning what sorts of things.

As regards pleasures and pains, it is evident that there are people who have self-control and are resilient as well as people who lack self-control and are soft. Some of the things productive of pleasure are necessary, however, and others are intrinsically choiceworthy but can be taken to excess. The necessary ones are the bodily ones (I mean such things as the ones concerned with nourishment or the need for sex, that is to say, such bodily ones as we took[118] temperance and intemperance to be concerned with). Others are not necessary but intrinsically choiceworthy (I mean, for example, victory, honor, wealth, and other such things as are good and pleasant). So—since all that is the case—when people, contrary to the correct reason that is in them, go to excess in relation to the intrinsically choiceworthy ones, we do not say that they unconditionally lack self-control but add that they lack self-control regarding wealth, profit, honor, or spirit. We do not say that they unconditionally lack self-control, on the supposition that they are different and that they are called "lacking in self-control" by similarity to those who unconditionally lack it (this is like saying the victor at the Olympic Games is human[119]); for, in his case, the common account differed only slightly from the special one, but was different nonetheless.

A sign of this is that lack of self-control, whether unconditional or partial, is blamed not only as an error but also as a sort of vice, while none of these other conditions is blamed.

But of those concerned with bodily gratifications (the ones that we say the temperate person and the intemperate person are concerned with), the person who goes to excess in pursuing these pleasant things and avoiding the painful ones (hunger, thirst, heat, cold, and all those concerned with touch and taste), not having deliberately chosen to, but instead contrary to his deliberate choice and thought, is called "lacking in self-control," not with the addition of what he lacks self-control about (for example, anger), but just unconditionally so.

A sign of this is that people are also called "soft" where these sorts of bodily pleasures and pains—but not any of the others—are concerned.

It is because of this too that we put the person who lacks self-control and the one who is intemperate in the same class (and also a self-controlled one and

118. 1118a1–b8.

119. A man named "Human" was a boxing champion in the Olympic Games of 456 BC. He is *a* human, so that the account common to all human beings also applies to him. At the same time, there is also an account special to him that differs only slightly from the common one.

a temperate one), but none of the others. This is because the former are concerned, in a way, with the same pleasures and pains. But though these people are concerned with the same things, they are not concerned with them in the same way; instead, some of them act from deliberate choice, while others do not act from deliberate choice. That is why we should rather give the name intemperate to the person who has no appetite or only a weak one for excessive pleasures, yet pursues them and avoids moderate pains, than to the person who does so because of having an intense appetite; for what would such a person do if he came to develop a vigorous appetite for the necessary pleasures and felt a strong pain at their lack?

Some appetites and pleasures have objects that are noble and excellent as a kind (for some pleasant things are by nature choiceworthy, while others are the contrary and others in between, as we determined earlier[120]—for example, wealth, profit, victory, and honor). So, as regards all things of this sort, and all the in-between ones, people are blamed not for being affected by them (that is, having an appetite for them and loving them) but for being affected in a certain way—that is, excessively. That is why those who, contrary to reason, are either controlled by or pursue some of these naturally noble and good things are blamed—for example, those who are more serious about honor than they should be or about children and parents; for though these are indeed good things and people are praised for being serious about them, nonetheless there is a sort of excess even in their case—for example, if someone were to be like Niobe and get in a fight even with the gods, or to behave toward his father like Satyrus, the so-called father-lover did—since Satyrus seemed to be utterly foolish about him.[121] So there is no depravity in these cases, because of what we have just said, that each of them is naturally choiceworthy because of itself, while excesses of them in their turn are base and to be avoided.

Similarly, there is no lack of self-control here either; for lack of self-control is not only something to be avoided but also blameworthy. But because of the similarity in the way of being affected, people call it "lack of self-control," adding that it has to do with a particular thing, as they call someone a "bad doctor" or a "bad actor," whom they would not call "unconditionally bad," because neither of these conditions is badness, but only like it by analogy. In the same way, it is clear that here too the only condition one must take to be self-control or lack of self-control is that which is concerned with the same things as temperance and intemperance, though by similarity we speak of it in relation to spirit. That is why we add the qualification and say lacking in self-control in relation to spirit, just as in relation to honor or in relation to profit.

120. 1147^{b}28–30.

121. He supposedly committed suicide on hearing of the death of his father.

7.5
Beast-Like, Diseased, and Morbid Conditions

Given that certain things are pleasant by nature, and of these, some are unconditionally so, while others are so with reference to particular kinds of animals and of human beings, while others are not, but come to be so (some because of a disability, some because of habit, some because of depraved natures), it is possible to see the states corresponding to each of these. I mean the beast-like ones—for example, that of the female who people say used to rip open pregnant women and devour their children; or the pleasures said to be enjoyed by some of the savages who live around the Black Sea,[122] some of whom eat raw meats, some human flesh, while others are said to reciprocally lend their children to each other to be eaten at festivities; or what they say about Phalaris. These states are beast-like.

Some, however, come about because of diseases (even because of madness, in some cases, like the man who sacrificed and ate his mother, or the one who ate the liver of his fellow slave). Others are morbid conditions arising from habit[123]—for example, plucking out one's hair or chewing on one's nails or even on pieces of charcoal and earth, and besides these, sexual intercourse between males. In some cases, these come about naturally; in some as a result of habit—for example, those who suffer wanton aggression from childhood on. If nature were the cause, no one would call these people "lacking in self-control" any more than one would call women such because they have the passive rather than the active role in copulation. The same goes for those who are in a morbid condition because of habit.

On the one hand, then, having each of these conditions is outside the defining marks of vice, just as beastliness also is. On the other hand, having them and exercising control over them or being controlled by them is not unconditional lack of self-control, but rather lack of self-control by resemblance, as the person who is in this condition where spirited feelings are concerned must be called "lacking in self-control by way of his feelings" but not "lacking in self-control." For among all excessive states, whether of foolishness, cowardice, intemperance, and harshness, some are beast-like, while others are morbid conditions; for the one who is by nature the sort of person to fear everything—even the squeak of a mouse—is cowardly with a beast-like cowardice, while the individual who was afraid of his weasel was so because of a disease. Among foolish people as well, those who are naturally without rational calculation and so live by perception alone—like some remote barbarian races—are beast-like, while others are foolish because of diseases, such as epilepsy, or because of morbid madness.

Among these conditions, however, there are some it is possible to have sometimes without being controlled by them (I mean, for example, if Phalaris had an appetite

122. *Pol.* 1338b19–23.
123. Secluding ἢ.

for eating a child or for some strange sexual pleasure, but restrained it). But it is also possible to be controlled by them and not just to have them.

Just as is also the case with depravity, then, where the sort that is on a human level is called "depravity" unconditionally while the other sort is so called with the addition that it is a beast-like or a morbid condition, but not unconditionally, in the same way it is clear that lack of self-control too is in some cases beast-like and in others a morbid condition, while the unconditional sort is that in accord with human-level intemperance alone.

It is clear, then, that lack of self-control and self-control are concerned only with the very same things as intemperance and temperance, and that concerning the other things there is another form of lack of self-control that is so called by transference and not unconditionally.

7.6
Lack of Self-Control Due to Spirit and Appetite

Let us next get a theoretical grasp on the fact that spirit's lack of self-control is less shameful than appetite's. For spirit seems to listen a bit to what reason says but to mishear it, like hasty servants who run off before they hear the whole of what is said and then mistake the command, or dogs that before investigating to see if it is a friend bark at a sound alone. In the same way spirit, because of its hot and hasty nature, though hearing something, not hearing a command, rushes off to exact revenge. For reason or imagination has revealed that wanton aggression or contemptuous treatment has occurred, and spirit—as if deducing that this sort of thing must be fought against—becomes angry straightaway. Appetite, on the other hand, only needs reason or perception to say that this is pleasant, and it impulsively rushes off to indulge itself. So spirit follows reason, in a way, but appetite does not. Hence it is more shameful; **1149b1** for the person who lacks self-control regarding spirit is defeated by reason in a way, the other one by appetite and not by reason.

Further, there is more a feeling of sympathetic consideration for people who follow natural desires, since there is more even in the case of those appetites that are common to all, and to the extent that they are common. But spirit and ill-temper are more natural than are appetites for excess and for things that are not necessary. It is like the case of the son defending himself for beating his father: "Yes, indeed I did beat him," he said, "but he beat his father, and he beat his," and, pointing to his own young child, he said, "and he'll beat me when he becomes a man—it runs in the family." Or the man, being dragged by his son, who used to urge him to stop at the front door since in fact that was as far as he had dragged his own father.

Further, people who are more given to plotting are more unjust. The spirited person does not plot, and neither does spirit; on the contrary, it is out in the open. But appetite, as they say about Aphrodite, is "a weaver of guile, indeed, from Cyprus

sprung," and, as Homer says of her embroidered girdle, "an allurement that steals understanding from the wisest minds."[124] So, if indeed this sort of lack of self-control is more unjust and more shameful than that having to do with spirit, it is unconditional lack of self-control and, in a way, vice.

Further, no one feels pain while committing wanton aggression, but everyone who does it in anger is pained by doing it, while the wantonly aggressive person does what he does with pleasure. If, then, those acts it is most just to be angry at are more unjust, so too is the lack of self-control that comes about because of appetite; for there is no wanton aggression in spirit.

It is clear, then, that lack of self-control regarding appetites is more shameful than lack of self-control regarding spirit, and that self-control and lack of self-control are concerned with appetites and pleasures that are bodily; however, there are differences among these appetites and pleasures that we need to grasp. For as we said[125] at the start, some of them are human and natural both in kind and magnitude, some are beast-like, while some are due to disabilities or diseases. Temperance and intemperance are concerned only with the first of these. That is why we do not say that wild beasts are either temperate or intemperate except by transference, that is, if one[126] kind of animal is wholly different from others in wanton aggression, as it may be, or destructiveness or gluttony. For they do not have deliberative choice or rational calculation, but are a degeneration from nature, like madmen among human beings.

1150a1 Beastliness is a lesser thing than evil (although it is more frightening); for the better thing has not been destroyed, as in the human case, but is just not present. So it is like comparing something inanimate to something animate, to see which is worse; for the baseness of what does not possess the starting-point is always less destructive, and understanding is a starting-point. So the comparison is much the same as that between injustice and an unjust human being. For there is a way in which each is worse—for an evil human being will do ten thousand times as much evil as a beast.

7.7
Lack of Self-Control, Intemperance, Softness, and Resilience

As regards the pleasures and pains that come about through touch and taste, as well as the appetites for them and the avoidances of them (that is, the ones we earlier determined[127] were the concern of both intemperance and temperance), it is possible for someone to be in a state such that he is defeated even by those that ordinary people are stronger than, and possible to control even those that ordinary people are defeated by. Among these, as regards pleasures, the one is self-controlled and the

124. *Iliad* 14.214, 217.
125. 1148b15–18.
126. Reading τι.
127. 1118a1–b8.

other lacks self-control, while as regards pains, the one is soft and the other resilient. The state of most people lies in between these, even though they may incline more toward the worse ones.

But since some pleasures are necessary, while others are not, and the former are so, up to a point, while their excesses and deficiencies are not, and similarly as regards both appetites and pains, the person who pursues the excesses of pleasures (or does so to excess) and does so because of deliberate choice,[128] because of the pleasures themselves and not because of any further consequence, is intemperate; for he necessarily has no regrets and so is incurable; for the sort of person who has no regrets is incurable. (The person who is deficient is his opposite, while one in a mean is temperate.) It is the same way for the one who avoids bodily pains not because he is defeated but because of deliberate choice.

(Among those who do not act from deliberate choice, one is led on because of the pleasure, another because he is avoiding the pain that comes from appetite, so that these differ from each other. Everyone would think someone to be worse, however, if he did a shameful action with either no or weak appetite than if he did it with intense appetite, and worse for striking someone when he was not angry than for doing it when he was angry; for what would he have done if he were in the grip of these feelings? That is why the intemperate person is worse than the one who lacks self-control.)

Among the cases mentioned, then, one is more a form of softness, while the other person is intemperate.

The person with self-control is the opposite of the person without it, and a resilient one is the opposite of one who is soft; for being resilient consists in resisting, self-control in controlling. And resisting is different from controlling, just as not being defeated is different from winning. That is why self-control is more choiceworthy than resilience.

The person who is deficient concerning the things that ordinary people both resist **1150^{b}1** and are capable of resisting is soft and effeminate; for in fact effeminacy is a sort of softness. Such a person trails his cloak on the ground in order not to suffer the pain of lifting it up, and, while acting like an invalid, does not think himself a wretched person, while being like one.

Similar things also hold concerning self-control and lack of self-control. For if someone is defeated by strong or excessive pleasures or pains, it is not surprising. Rather, it merits sympathetic consideration provided that he holds out against them—like the *Philoctetes* of Theodectes when bitten by the snake or like Cercyon in the *Alope* of Carcinus or like people trying to restrain their laughter who suddenly burst out laughing, as happened to Xenophantus. But it is surprising if someone does this in connection with things that ordinary people are capable of resisting, and if he is defeated by these and is incapable of holding out, not because of his congenital

128. Reading ἢ καθ' ὑπερβολὴν καὶ.

nature (as, for example, in the Scythian kings whose softness is congenital), or because of disease, or as female is distinguished from male.[129]

An amusement lover, for his part, also seems to be intemperate, but he is actually soft. For amusement is a loosening up, if indeed it is a relaxation, and an amusement lover is one of those who go to excess where relaxation is concerned.

One sort of lack of self-control is impetuosity, another is weakness. For the latter, though they have deliberated, do not stand by the results of their deliberations because of feeling, while the former are led on by their feelings because they have not deliberated; for just as those who tickle first cannot be tickled back, some of these people, if they are aware of it beforehand and have seen it coming and have roused themselves and their capacity for rational calculation ahead of time, are not defeated by what they are feeling, whether pleasant or painful.

It is most of all quick-spirited and impulsive people who are lacking in the self-control that is impetuous lack of self-control. For it is because of the hastiness in the one case and because of the intensity in the other that they do not wait for reason, because they are the sort of people who follow appearances.

7.8
Why Intemperance Is Worse Than Lack of Self-Control

The intemperate person, as we said,[130] is not the sort to have regrets; for he stands by his deliberate choice, while everyone who lacks self-control has regrets. That is why things are not the way we suggested in listing the puzzles.[131] Instead, the intemperate person is incurable, while the one who lacks self-control is curable; for depravity resembles diseases like dropsy or consumption, while lack of self-control is like epilepsy; for depravity is continuous wickedness, while lack of self-control is not. And, in general, lack of self-control and vice are distinct in kind; for vice escapes its possessor's notice, while lack of self-control does not escape it.

Among people who lack self-control themselves, those who are disposed to depart **1151a1** from reason are better than those who have the reason but do not stand by it; for the latter give in to a weaker way of being affected and do not act without prior deliberation as the former sort do; for the person who lacks self-control is like those who get drunk quickly and on a little wine or on less wine than ordinary people.

That lack of self-control is not a vice is evident, then, although perhaps it is one in a way; for lack of self-control is contrary to deliberate choice, while vice is in accord with deliberate choice. Nevertheless, lack of self-control is similar to vice, at least, as regards their actions. It is like what Demodocus said about the Milesians:

129. *HA* 608a33–b18.
130. 1150a20–22.
131. 7.2.

The Milesians aren't stupid people
But they do precisely what stupid people do.[132]

In the same way, people who lack self-control are not unjust but will do unjust actions.

But since the person who lacks self-control is the sort who pursues bodily pleasures that are excessive and contrary to correct reason but not because he is persuaded that he should, while the intemperate person is persuaded, because he is the sort of person to pursue them, the person who lacks self-control is easily persuaded to change; an intemperate one isn't; for virtue preserves the starting-point, while depravity destroys it, and in actions what we do them for the sake of is the starting-point, just as hypotheses are in mathematics. (Reason, then, does not teach the starting-points either in the case of mathematics or in the present one. Instead, it is virtue, whether natural or habituated, that teaches correct belief about the starting-point.) The person who is of this sort is temperate and his contrary intemperate.

But there is a person who, because of feeling, is disposed to depart from and go contrary to correct reason, who is controlled by that feeling to the extent of not acting in accord with correct reason, but not so as to be the sort of person who is persuaded that he should pursue such pleasures freely. This is the person who lacks self-control; he is better than the intemperate person and is not unconditionally base; for the best thing is preserved in him: the starting-point. Another sort of person is contrary to this one. He is disposed to stand by and not depart from [correct reason]—at least, not because of feeling. It is evident from this, then, that the one state is excellent, while the other is base.

7.9
Self-Control

Is the self-controlled person one who stands by any reason whatsoever and any deliberate choice whatsoever or is it one who stands by the correct deliberate choice? And is someone lacking in self-control if he does not stand by any deliberate choice whatsoever or any reason whatsoever, or must it be a reason that is not false and a correct deliberate choice? This is the puzzle that was raised earlier.[133] Or is it coincidentally any reason or deliberate choice whatsoever, but intrinsically the true reason and the correct deliberate choice, that the one stands by and the other does not stand by? For if someone chooses or pursues this because of that, he pursues and chooses the second intrinsically but the first coincidentally. But what is intrinsic, we say, is **1151b1** unconditional. Therefore, in one way it is any belief whatsoever that the one stands by and the other departs from, but unconditionally it is true belief.

132. Fr. 1 West.
133. 1146a16–21.

There are some people who are the sort to stand by their belief, whom we call "stubborn"—the ones who are difficult to persuade into something and not easy to persuade out of it. These have some similarity to the self-controlled (just as the wasteful person does to the generous one, and the rash person to the confident one), but in many respects they are different. For it is by feeling and appetite that the self-controlled person is not moved, since he will be easily persuaded when occasion arises; while it is by reason that stubborn people are not moved, since they hold on to their appetites, of course, and many of them are led on by pleasures.

It is opinionated people, unlearned ones, and boorish ones who are stubborn. Opinionated ones are such because of pleasure and pain; for they enjoy being victorious if they are not persuaded to change their views and are pained if their own beliefs lose control, insofar as these are like decrees. As a result they are more like the person who lacks self-control than like one who has it.

There are some people, however, who do not stand by their beliefs, but not because of lack of self-control—for example, Neoptolemus in Sophocles' *Philoctetes*.[134] And yet it was because of pleasure that he did not stand firm, but it was a noble pleasure; for telling the truth was a noble thing to him, but he had been persuaded by Odysseus to lie. For not everyone who does something because of pleasure is intemperate, base, or lacking in self-control—only the one who does so because of a shameful pleasure.

But since there is also the sort of person who enjoys bodily pleasures less than one should and does not stand by reason, the person with self-control is a mean between this one and one who lacks it; for the person who lacks self-control does not stand by reason because of too much of something, this one because of too little. The one with self-control, by contrast, stands firm and does not change because of either. If indeed self-control is something excellent, both of these contrary states must be base, as they in fact appear to be. But because the other state is evident in only a few people and on rare occasions, the result is that just as temperance seems contrary only to intemperance, self-control seems contrary only to lack of self-control.

Since many things are called what they are by similarity, it is by similarity too that we have come to speak of the self-control of a temperate person; for both the self-controlled person and the temperate one are the sorts of people to do nothing contrary to reason because of bodily pleasures. But the former has base appetites, while
1152a1 the latter does not, and the latter is the sort not to feel pleasure contrary to reason, while the former is the sort to feel such pleasure but not be led by it.

Furthermore, the person who lacks self-control and the intemperate person are also similar; even though they are different, they both pursue bodily pleasures, but the latter actually thinks he should do so, while the former does not.

134. 1146a19.

7.10
Lack of Self-Control and Practical Wisdom

Nor is it possible for the same person to be at the same time practically wise and lacking in self-control; for it has been proved[135] that a person is at once practically wise and excellent in character. Further, a person is not practically wise by knowing alone but also by being a doer of the action, while the person who lacks self-control is not a doer of the action. (But nothing prevents the clever person from lacking self-control. That is why indeed some people are sometimes thought to be practically wise but lacking in self-control, because cleverness and practical wisdom differ in the way we described[136] in our initial account, that is, they are close as regards reason, but different as regards deliberate choice.) Nor, of course, is the person who lacks self-control like the one who knows something and is actively contemplating it, but like the one who is asleep or tipsy.

Also, he acts voluntarily (for in a way he acts knowing both what he is doing and for the sake of what), but he is not a wicked person; for his deliberate choice is decent. So he is half wicked. And he is not unjust; for he is not a plotter. For one sort of person who lacks self-control does not stand by the results of his deliberation, while the other, the passionate one, is not the sort to deliberate at all.

In fact, the person who lacks self-control is like a city that passes all the decrees it should and has excellent laws, but puts them to no use—as in Anaxandrides' jibe, "the city willed it, that cares nothing for laws." The wicked person, by contrast, is like a city that puts its laws to use but puts to use wicked ones.

Lack of self-control and self-control are concerned with what exceeds the state of ordinary people; for the latter stands firm more than most people are capable of doing, while the former does so less.

The sort of lack of self-control that is found in passionate people who act without self-control is more easily cured than the sort found in those who deliberate but do not stand firm, and those who lack self-control because of habituation are more easily cured than those whose lack of self-control is natural; for habit is easier to change than nature; for that is why this in fact is difficult to change, because it resembles nature, as Evenus too says:

> I say that habit's but long practice, friend,
> And this becomes men's nature in the end.[137]

We have now said what self-control is, what lack of self-control, what resilience, and what softness, and how these states are related to each other.

136. 1144ᵃ22–29.
137. Fr. 9 West.

7.11
Pleasure and Pain

Having a theoretical grasp on pleasure and pain is characteristic of the political philosopher; for he is the architectonic craftsman of the end we look to in calling each thing unconditionally "bad" or "good."

Further, it is actually a necessary requirement that we investigate them; for we posited[138] that both virtue and vice of character are concerned with pains and pleasures, and most people say that happiness involves pleasure. That is why a *makarios* ("blessed") person is so called, after *chairein* ("to enjoy").

In point of fact, it seems to some people that no pleasure is a good, either intrinsically or coincidentally (for the good and pleasure are not the same), while it seems to others that some pleasures are good but that many are base. Further, there is a third of these views, that even if every pleasure were a good, nonetheless it is not possible for the best good to be pleasure.

Generally speaking, then, it is not a good, because every pleasure is a perceived coming to be in the natural state,[139] but no coming to be is the same in kind as its end—for example, no process of building is the same in kind as a house. Further, the temperate person avoids pleasures.[140] Further, the practically wise person pursues what is painless, not what is pleasant. Further, pleasures impede thinking,[141] and the more we enjoy them, the more they do so—for example, sexual pleasure (for no one is capable of actively understanding anything in the midst of it). Further, there is no craft of pleasure,[142] and yet everything good is the work of some craft. Further, children and wild beasts pursue pleasures.

As for not all pleasures being excellent, it is because there are also pleasures that are actually shameful and objects of reproach, and because there are pleasures that are harmful (for some pleasant things cause diseases).

That pleasure is not the best good is because it is not an end but a coming to be.

These, then, are pretty much the things that are said.

7.12
Pleasure and Goodness

But that it does not follow from these arguments that pleasure is not a good—or even that it is not the best good—is clear from these next considerations.

138. 1104b13–28, 1105a10–16.
139. Plato, *Philebus* 54c–55a.
140. Plato, *Phaedo* 68c.
141. Plato, *Phaedo* 63d, 66b–c.
142. Plato, *Gorgias* 464b–465a.

First, since what is good is twofold (for one is unconditionally so, the other so for some person), natures and states will follow suit, and so also will movements and comings to be; and of those that seem to be bad some will be unconditionally bad, though not so for some person, but instead choiceworthy for him, while some are not so even for some person but are choiceworthy at a particular time and for a short period and not unconditionally. And some are not even pleasures but only appear to be—those that involve pain and are for the sake of a cure, for example, the ones sick people undergo.

Further, since one sort of good is an activity and another sort is a state, restorations to our natural state are only coincidentally pleasures. The activity in the case of the appetites belongs to the healthy remainder of state and nature, although there are in fact pleasures without pain or appetite, such as the activities of contemplation, where there is no lack in the natural state. A sign of this is that people do not enjoy the **1153^{a}1** same thing as pleasant while a lack in their natural state is being replenished as they do when it has been restored. Rather, when it has been restored, they enjoy things that are unconditionally pleasant, but when it is being replenished they enjoy even their contraries; for they enjoy even sharp and bitter things, none of which is either by nature pleasant or unconditionally pleasant. So the pleasures are not so either; for as pleasant things stand apart from each other, so also do the pleasures arising from them.

Further, it is not necessary for something else to be better than pleasure in the way that the end, some people say, is better than its coming to be; for pleasures are not comings to be nor do they all involve comings to be, but rather they are activities and an end, and they do not occur when we come to be something but when we use something. Also, not all pleasures have something else as end but only those that lead to the completion of our nature. That is why it is not correct to say that pleasure is a perceived coming to be, but rather say that it is activity of a natural state, and that it is unimpeded instead of perceived.[143] But it seems to some people to be a coming to be, because it is good in the strict sense; for they think an activity is a coming to be, while in fact it is a distinct thing.

To say that pleasant things are bad because some of them cause diseases is the same as saying that healthy things are bad because some of them are bad in relation to moneymaking. Both of them are certainly bad in the relevant respect, but they are not bad on account of this, at any rate, since even contemplation is sometimes harmful to health.

Neither practical wisdom nor any state at all is impeded by the pleasure specific to it but only by alien ones, since the pleasures arising from contemplation and learning will make us contemplate and learn all the more.

The fact that no pleasure is the work of a craft is what we would reasonably expect; for there is no craft of any other activity either, but only of the corresponding

143. $1153^{b}9$–12.

capacity—and yet the crafts of the perfumer and the gourmet chef do seem to be crafts of pleasure.[144]

As for the temperate person avoiding pleasure, the practically wise person pursuing a painless life, and children and wild beasts pursuing pleasure, all these are resolved in the same way. For since we have said in what way pleasures are good and in what way not unconditionally good,[145] it is the latter sort that both wild beasts and children pursue, and it is painlessness in the case of these that the practically wise person pursues. These are the ones involving appetite and pain, that is, the bodily ones (for they are of this sort) and their excesses, regarding which the intemperate person is intemperate. That is why the temperate person avoids these pleasures, since there are pleasures characteristic even of a temperate person.

7.13
Pleasure and Happiness

1153b1 Moreover, it is also agreed that pain is a bad thing, and something to be avoided; for one sort of pain is an unconditionally bad thing, while another is bad by being in some way an impediment. But the contrary of what is to be avoided—insofar as it is something to be avoided and bad—is a good. So pleasure must be a sort of good. For the resolution of this argument that Speusippus used to propose does not in fact resolve it, that it is just like the case of the greater being the contrary of the lesser and of the equal; for he would not say that pleasure is precisely something bad. And even if some pleasures are bad, nothing prevents a pleasure of some sort from being the best good, just as some science might be the best good[146] even if some sciences are bad.

And perhaps it is actually necessary that if there are indeed unimpeded activities of each state, no matter whether happiness is the activity of all of them or of one of them in particular, then this activity, insofar as it is unimpeded, is the most choiceworthy. But this is pleasure. So the best good might be some sort of pleasure, even if most pleasures turned out to be bad—even unconditionally bad.

It is because of this in fact that everyone thinks that the happy life is a pleasant one and reasonably weaves pleasure into happiness; for no activity is complete when it is impeded, and happiness is something complete. That is why the happy person needs to have goods of the body, external goods, and luck in addition, so that he will not be impeded in the corresponding ways. People who claim that the person who is broken on the rack or succumbs to great strokes of bad luck is happy provided that he is good are talking nonsense, whether voluntarily or involuntarily.

In fact, because the happy person needs the goods that luck brings in addition, some people think that good luck is the same as happiness. But it isn't, since even

144. †*MM* 1206a26–31.
145. Reading πῶς . . . ἀγαθαὶ ἁπλῶς.
146. 1178b20–23, *EE* 1249b19–21.

good luck is an impediment when it is excessive, and presumably is no longer by rights called "good luck"; for the defining mark of good luck is determined by relation to happiness.

Also, the fact that all things—both wild beasts and human beings—pursue pleasure is an indication that pleasure is in some way the best good: "No claim comes altogether to naught that many folks spread. . . ."[147] But since the same nature or state neither is nor seems to be the best for all, neither do they all pursue the same pleasure, although all do pursue pleasure. And perhaps they are actually pursuing not the one they think or would say that they were pursuing but the same pleasure; for all things by nature have something divine in them. But the bodily pleasures have appropriated the name "pleasure," because we most often steer toward them and because all share in them. So, because these are the only ones people know, they think that they are the only pleasures.

It is also evident that if pleasure is not a good and an activity, it will not be possible **1154ᵃ1** for the happy person to live pleasantly; for what would he need it for, if indeed it is not a good, but it is even possible that the happy person live painfully? For pain is neither a bad thing nor a good one, if indeed pleasure is neither of these. So why would he avoid it? Nor indeed would the life of the excellent person be more pleasant, if his activities were not so too.

7.14
Bodily Pleasures

But now, as regards the bodily pleasures, there is a question to be investigated by those who say that some pleasures at least are intensely choiceworthy (for example, the noble ones), but not the bodily ones (that is, the ones with which the intemperate person is concerned): why then is it that the contrary pains are bad? For good is contrary to bad.

Or are the necessary pleasures good in this way, that even what is not bad is good? Or are they good up to a point? For of some states and processes there cannot be an excess that is better, and so there cannot be an excess of the pleasure of them either, while of others there can be such an excess, and so there can be an excess of their pleasure too. Of the goods of the body, however, there can be an excess, and it is by pursuing the excess, not the necessary pleasures, that the base person is base; for everyone enjoys gourmet dishes, wines, and sex in some way, although not everyone does so in the way one should.

But it is contrariwise in the case of pain; for it is not just the excess that the base person avoids but pain generally; for pain is not contrary to the excess of pleasure except to the person who pursues excess.

147. Hesiod, *Works and Days* 763.

But since one must not only state the true view, but also the cause of the false one (for that contributes to our conviction; for when a reasonable explanation is given of why an untrue view appears true, this makes us more convinced of the true view), one must say why it is that bodily pleasures appear more choiceworthy.

Surely, the first reason is that bodily pleasure knocks out pain. Because of excessive pain, in fact, people pursue excessive pleasure, and bodily pleasure generally, as if it were a cure. But these cures become intense (which is why they are pursued) because they appear alongside their contrary.

(Indeed, pleasure seems to be no excellent thing, as we said,[148] because of the following two considerations. Some are the actions of a base nature—whether congenital, as with a wild beast, or by habituation, like the actions of base human beings. Others are cures for something lacking, and being in the good state is better than coming to be in it, but these occur in the process of coming to completion and so are **1154b1** coincidentally excellent.)

Further, bodily pleasures are pursued because of their intensity by people incapable of enjoying other sorts. At any rate, they contrive certain thirsts for themselves. When these are harmless, this is unobjectionable, although when they are harmful, it is base. For they have nothing else to enjoy, and besides, what is neither pleasant nor painful is painful to many people because of their nature. For an animal is always toiling, as the natural scientists also testify, claiming that seeing and hearing are painful. But we have already become habituated to them, as they say. Similarly, during their youth—because they are growing—people are in a condition that is like tipsiness, and so youth is pleasant. People who are naturally impulsive, on the other hand, are always in need of a cure; for even their body is constantly stinging them because of its mix, and so they are always in a state of intense desire. But pain is driven out both by the contrary pleasure and by any random one, provided it is a strong one. And it is because of these things that such people become intemperate and base.

Pleasures that do not involve pain, however, have no excess. These are among the things naturally and not coincidentally pleasant.

By "coincidentally pleasant things" I mean the curative ones; for being cured happens to coincide with a certain activity of the part of us that remains healthy,[149] and because of this it seems to be pleasant. By "things that are by nature pleasant," on the other hand, I mean those that bring about action in a healthy nature.

In no case, though, is the same thing always pleasant, because our nature is not simple but also has another element in it, in that we are mortals. So, if one of the two is doing something, it is contrary to the nature of our other nature, and when the two are equally balanced, what we are doing seems neither painful nor pleasant; since if the nature of some being is simple, the same action will always be most pleasant.

148. 1152b26–33.
149. 1152b35.

That is why the god always enjoys a single simple pleasure; for there is not only an activity of moving but also an activity of immobility, and pleasure is found more in rest than in movement.[150] "Change in all things is sweet," as the poet says,[151] because of a sort of defect; for just as a defective human being is an easily changeable one, a nature that needs change is also defective; for it is neither simple nor decent.

We have now discussed self-control and lack of self-control as well as pleasure and pain, and said what each of them is and in what ways some of them are good and others bad. It remains for us also to discuss friendship.

BOOK 8

1155ᵃ1

8.1
Views about Friendship

The next issue we should discuss is friendship; for friendship is a sort of virtue or involves virtue. Further, it is most necessary for living. For no one would choose to live without friends, even if he had all the other good things; for even wealthy people and those who are rulers or hold positions of power seem to need friends most; for of what benefit is such prosperity once the opportunity to be a benefactor—which occurs most and is most praiseworthy when it is toward friends—is removed? Or in what way could their prosperity be protected and safeguarded without friends? For the greater their prosperity is, the more precarious it is.

In poverty too, as in all other strokes of bad luck, people think friends to be their only refuge. Also, friends are necessary for young people with a view to the avoidance of error, for old ones with a view to being taken care of and being given aid with the actions they have to leave unaccomplished because of their weakness, and for those in their prime with a view to doing noble actions—for when "two go together"[152] they are better able both to understand and to do actions.

Also, friendship seems to be by nature present in parent for offspring and offspring for parent, not only among human beings but also among birds and most of the animals and among members of the same race toward each other—most of all among human beings (which is why we praise friends of humanity). Even on our travels, we can see how every human being is akin and friend to every other human being.

It also seems that friendship holds cities together and that legislators take it more seriously than justice; for concord seems to be something like friendship, and this is what they aim at most, while faction, because it is enmity, they most seek to drive out. Also, if people are friends, there is no need for justice, while people who are just

150. *Met.* 1072ᵇ24–30.
151. Euripides, *Orestes* 234.
152. Homer, *Iliad* 10.224.

need friendship in addition to justice. Also, of just things, the most just of all seems to be fitted to friendship.

Friendship is not only something necessary, however, but also something noble; for we praise those who love their friends, and many-friendedness seems to be something noble. And further, it is the same people we consider to be good men and friends.

There are, however, quite a few disputes about friendship. For some suppose that it is a sort of likeness and that those who are alike are friends. Hence the sayings, "like is drawn to like," "birds of a feather flock together," and so on. Others, on the contrary, say that people who are alike are proverbial potters to each other.[153]

1155b1 Also, concerning these issues, some people conduct their inquiry at a higher level and one that is more appropriate to natural science. Euripides says that "earth is in love with rain," when it has become parched, and that "the majestic heaven, when filled with rainwater, is in love with falling on earth."[154] Heraclitus too says that "opposition unites," that the noblest harmonies arise from discord, and that everything comes about through strife.[155] Others, on the contrary, including Empedocles, say that like seeks like.[156]

The puzzles of natural science we may set aside (for they do not properly belong to the present investigation). But those that concern human affairs and pertain to characters and feelings we must investigate—for example, does friendship come about among all sorts of people or is it impossible for depraved people to be friends? Also, is there one form of friendship or more than one? For some people think that there is one form, because friendship admits of differences in degree; but they have been convinced by an inadequate sign; for things that are distinct in form also admit of the more and less. But we have spoken about these earlier.[157]

8.2
The Objects of Love and Friendship

But perhaps these issues would become evident if we first come to know the object of love. For not everything is loved, it seems, but only the object of love, and this is either good, pleasant, or useful. But what would seem to be useful is that through which some good or some pleasure comes about, so that the objects of love as ends would be the good and the pleasant.

153. Hesiod, *Works and Days* 25.
154. Fr. 898 Nauck.
155. The first is part of B8 DK; the second may paraphrase B51; the third may paraphrase B80.
156. B22, 62, 90 DK.
157. 1.6.

Is it, then, the good that people love or the good for themselves? For sometimes these clash. It is the same way where the pleasant is concerned. It seems indeed that what each person loves is the good for himself, and that while the good is unconditionally an object of love, the object of love for each person is the good for himself; but in fact each loves not the real good for himself, but rather the apparent one. But that will make no difference; for it will be the apparent object of love.

These three being the things because of which people love, the way of loving that is appropriate for inanimate objects is not called "friendship"; for there is no reciprocal loving involved and no wish for the object's good (for it would presumably be ridiculous for someone to wish good things for his wine, but if indeed it happens, it is for its preservation that he wishes, in order to have it for himself). But for a friend, it is said, we must wish good things for his own sake. Those who wish good things for someone in this way, however, if the same wish is not reciprocated, are said to have goodwill toward him; for friendship is said to be reciprocated goodwill.

Or must we add "that does not go unawares"? For many have goodwill toward people they have never seen but take to be decent or useful, and one of the latter might feel the same way toward one of them. That these people have goodwill toward each other is evident, but how could we call them "friends" when they are unaware of how they are mutually disposed? Therefore, friends must have goodwill toward (that is, wish good things for) each other because of one of the things we mentioned,[158] and not be unaware of it.

8.3
Three Forms of Friendship

But these things differ in form from each other, therefore so also do the ways of loving and the friendships. There are, then, three forms of friendship, equal in number to the objects of love; for in each there is a corresponding way of reciprocal loving that does not go unawares, and those who love each other wish good things for the other in the way in which they love. Those who love each other because of utility do not love each other intrinsically, but only insofar as some good comes to them from each other. It is the same way with those who love because of pleasure; for they like witty people not for having a character of a certain sort but because they are pleasant to them.

Those who love because of utility, then, feel affection because of what is good for themselves, and those who love because of pleasure do so because of what is pleasant to themselves, and not insofar as the beloved is who he is but insofar as he is useful or pleasant.

158. 1155ᵇ19.

These friendships, then, are in fact coincidentally friendships; for a person who is beloved in that way is loved not insofar as he is precisely who he is but insofar as he provides some good, in the one case, or some pleasure, in the other.

Such friendships are prone to dissolve easily, then, because of the friends not remaining the same; for if they are no longer pleasant or useful, they stop loving. Utility, though, does not remain the same, but differs from time to time. When, then, the things because of which they were friends have been removed, the friendship breaks off as well, inasmuch as the friendship related to these things.

This form of friendship seems to come about among older people most of all (for at that age it is not pleasure they pursue but what is beneficial), also among those in their prime or youth who pursue what is advantageous. But such people scarcely ever live together; for sometimes they are not even pleasant people. Nor, then, do they need this sort of social interaction unless the people are advantageous; for they are pleasant only to the extent that they have an expectation of some good. It is among these friendships that people also put guest-friendship.

Friendship between young people seems to exist because of pleasure; for they live in accord with their feelings and pursue most of all what is pleasant for themselves and present at hand. But as they grow older their pleasures also become different. That is why they quickly become friends and quickly stop being so; for the friendship changes along with what is pleasant, and that sort of pleasure changes quickly. Also, young people are prone to sexual desire; for sexual friendships are largely in accord with feeling and exist because of pleasure. That is why they love and quickly stop loving, often changing in a single day. But they do wish to spend their days together and to live together; for that is how they get what is in accord with their friendship.

Complete friendship, however, is the friendship of good people who are alike in virtue; for each alike wishes good things for the other insofar as he is good, and each is intrinsically good. And those who wish good things for their friends for their friends' sake are friends most of all; for it is because of themselves and not coincidentally that they are disposed in this way. Their friendship, then, lasts as long as they are good—and virtue is something stable. Also, each of them is unconditionally good and is so for his friend; for good people are both unconditionally good and beneficial for each other. They are likewise pleasant as well; for good people are both unconditionally pleasant and pleasant for each other; for his own actions, and those similar to them, are pleasurable for each, and the actions of good people are the same or similar.

This sort of friendship is with good reason stable; for it joins together within it all the qualities that friends should have. For every sort of friendship exists because of some good or because of pleasure, whether unconditionally or for the person loving, and is in accord with some likeness between the parties. But to this sort of friendship all the qualities we mentioned belong, because of the friends themselves; for they are similar in this way,[159] and the rest. Also what is unconditionally good is also

159. Reading ταύτῃ γὰρ ὅμοιοι.

unconditionally pleasant, and these most of all are objects of love. Loving, then, and friendship too, exist most and at their best between people like these.

Friendships like these are likely to be rare, however; for there are few such people. Furthermore, time and intimacy are needed in addition; for as the proverb says, people cannot know each other until they have eaten the canonical amount of salt together.[160] They cannot accept each other, then, or be friends either until each appears as an object of love to the other and gains his trust.

Those who quickly do for each other things fitted to friendship, on the other hand, wish to be friends, but are not friends unless they are also objects of love and know this; for though the wish for friendship comes about quickly, friendship does not.

8.4
Comparisons between the Forms of Friendship (1)

So this form of friendship is complete both as regards time and as regards the rest, and in all of them each party gets the same or similar things from the other, which is precisely what should happen between friends.

The friendship that exists because of pleasure bears a similarity to the complete form of friendship; for good people are also pleasant to each other. It is the same way with the sort that exists because of utility; for good people are also useful to each other. And between these sorts of friends, friendships are also most lasting when the parties get the same thing—for example, pleasure—from each other, and not only that but also get it from the same thing, as happens with witty people, for example, and not as with a lover and his boyfriend. For these do not take pleasure in the same things, but one takes pleasure in looking at the other, while the other takes pleasure in being taken care of by his lover. As the boy's bloom fades, however, sometimes the friendship also fades (for the lover does not take pleasure in seeing the boy, and the boy does not get taken care of by his lover). On the other hand, many do remain friends, if as a result of their intimacy they come to feel affection for each other's character, having similar characters themselves.

Those who exchange not pleasure but utility in their sexual friendships are and remain friends to a lesser degree. Those who are friends because of utility break off their friendship as soon as the advantage is at an end; for it was not to each other that they were friends but to gain.

Because of pleasure and because of utility, in fact, even base people can be friends with each other, as can decent people with base ones, and ones who are neither bad nor decent with a person of any sort whatever. But it is clear that only good people

160. *EE* 1238^{a}2–3.

can be friends because of themselves; for bad ones find no enjoyment in each other unless some benefit might come about.

Also, the friendship of good people is the only sort that is immune to slander; for it is not easy to trust anyone about a person we have ourselves put to the test over a long period of time. Also, there is trust between them, and the conviction that "he would never do an injustice," and all the other things required in a true friendship. But in the other sorts of friendship there is nothing to prevent things like these from happening.

For since people call "friends" even those who are such because of utility, just as they do with cities (for alliances come about between cities for the sake of what is advantageous), and also apply it to those who feel affection for each other because of pleasure (just as in the case of children), presumably we too should call such people "friends," while saying that there are more forms of friendship than one. Friendship in the primary and strict sense is that between good people insofar as they are good, while the rest are friendships by similarity to it; for it is insofar as there is something good in their relationship, or some similarity between them, that they are friends; for what is pleasant is also good to lovers of pleasure.

The latter sorts of friendship are scarcely ever joined together, nor do the same people become friends because of utility and because of pleasure; for things that are coincidental to a subject are scarcely ever coupled.

1157b1 With friendships divided into these forms, base people will be friends because of pleasure or because of utility, since that is the respect in which they are alike. But good people will be friends because of themselves; for they will be friends insofar as they are good. They are friends unconditionally, then, while the others are friends coincidentally and by similarity to these.

8.5
Friendship as Activity and as State

Just as with the virtues, where some people are called "good" with regard to a state, others with regard to an activity, so it is with friendship too; for the ones who live together find enjoyment in each other and provide the requisite good things. The ones who are asleep or in separate places, on the other hand, though not actively doing them, have the state that would result in their doing the things fitted to friendship; for separate places do not break off friendship unconditionally but rather its activity. But if the absence goes on for a long time, it seems to make people forget even their friendship—hence the saying, "many a friendship has broken off for want of conversation."[161]

Neither older people nor sour-tempered ones seem fitted for friendship; for there is little pleasure to be found in them, and no one can spend his days with what is

161. Source unknown.

painful or with what is not pleasant; for it is evident that nature most avoids what is painful and seeks what is pleasant. People who approve of each other yet do not live together seem to have goodwill rather than friendship. For nothing is so fitted to friendship as living together (for while people who are in need desire benefit, even the blessed desire to spend their days together; for a solitary life suits them least of all). But passing the time with each other is not possible for people who are not pleasant and do not enjoy the same things, which is precisely what companionate friendship seems to involve.

The friendship of good people is most of all friendship, as we have often said; for the unconditionally good or pleasant seems to be an object of love and a choiceworthy thing, and to each person it is what is good or pleasant for him that seems to be such; and the good person is such to another good person on both grounds.

Loving seems to be a feeling, while friendship seems to be a state; for loving seems to be no less directed toward inanimate things. But reciprocal loving involves deliberate choice, and deliberate choice stems from a state. Also, when people wish good things for their beloveds for their beloveds' own sake, that they do so is not in accord with a feeling but with a state. Also, in loving their friend they love what is good for themselves; for the good person, in becoming a friend, becomes a good for the person for whom he is a friend. Each of the two, then, both loves what is good for himself and makes an equal return in the good he wishes and in what is pleasant (for friendship is said to be equality), and it is most of all in the friendship of good people that these qualities are found.

8.6
Comparisons between the Forms of Friendship (2)

Among sour-tempered or older people, friendship less often comes about, insofar as they are disagreeable and find less enjoyment in social interaction; for these are the qualities that seem to be most fitted to friendship and productive of it. That is why young people become friends quickly, while older ones do not (since people do not become friends with those they find no enjoyment in); and similarly neither do sour-tempered ones. But such people can have goodwill toward each other; for they wish each other good things and meet each other's needs. But they are scarcely friends, because they do not spend their days together and do not find enjoyment in each other—which are precisely the things that seem most fitted to friendship. **1158ª1**

To be a friend to many people, however, in a way that accords with complete friendship, is not possible, just as it is not possible to be in love with many people at the same time (for sexual love toward many people is like an excess, and something of that sort naturally comes about in relation to a single person). And it is not easy for many people to please the same person intensely at the same time, nor, presumably, for them to be good. Besides, he must actually acquire experience of them and

become intimate with them, which is very difficult. If, however, the friendship exists because of pleasure or because of utility, it is possible for someone to please many people; for there are many people of the sort that are satisfied this way, and the services involved take little time.

Among these, the one that exists because of pleasure is more like friendship, when both parties get the same things from each other and find enjoyment in each other, or in the same things. The friendships of young people are like this; for the element of generosity is found more in these. The sort that exists because of utility, by contrast, is characteristic of businesslike people. Also, blessed people, though they have no need of useful friends, do need pleasant ones; for they wish to have people to live together with, and, while they can bear what is painful for a short time, no one could withstand even the good itself continuously, if it were painful to him. That is why they seek friends who are pleasant. But presumably they should seek such as are also good—and further, good for them; for that way they will have everything that friends must have.

People in positions of authority appear to make use of distinct groups of friends; for some are useful and others pleasing, while the same people are scarcely ever both; for they do not seek friends whose being pleasant involves virtue, or who are useful with a view to noble actions, but rather witty people if it is pleasure they aim at, or those, on the other hand, who are clever at doing the actions prescribed, and these qualities are scarcely ever found together.

Although we did say that the excellent person is both pleasant and useful at the same time, still that sort of person does not become a friend to a superior unless the latter is superior in virtue too (otherwise he does not achieve proportional equality as an inferior). But superiors like that are scarcely ever found.

1158b1 The sorts of friendships we have discussed are based on equality; for both parties get the same and wish the same for each other, or trade one thing for another—for example, pleasure for benefit. But that these are both lesser friendships and less lasting ones, we have already said. Because of their similarity and dissimilarity to the same thing, indeed, they seem both to be and not to be friendships; for insofar as they are similar to friendship in accord with virtue they are apparently friendships (for one of them involves pleasure and the other utility, and friendship in accord with virtue also involves these), but insofar as friendship in accord with virtue is immune to slander and stable, while these sorts change quickly, and differ from it in many other ways, they are apparently not friendships, because of their dissimilarity to it.

8.7
Friendships between Unequals

A different form of friendship, however, is the one in accord with superiority—for example, of a father for his son, of older for younger generally, of man for woman, and of any sort of ruler for someone he rules. But these also differ from each other;

for the friendship of parents for children is not the same as that of ruler for ruled, but neither are those of father for son and son for father, or those of man for woman and woman for man. For of each of the parties involved there is a different virtue and a different work—different too are the things because of which they love. So the ways of loving and the friendships are also different.

Each, then, does not get the same things from the other and should not seek them either. But when children render to their parents what should be rendered to begetters, and parents render to their children what should be rendered to offspring, the friendship of such people will be stable and decent. In all friendships in accord with a superiority, however, the loving should be proportional too—for example, the better person should be more loved than loving, as should the more beneficial one, and similarly in each of the other cases; for when loving is in accord with worth, a sort of equality comes about, and that seems to be characteristic of friendship.

The equal does not seem to be the same in matters of justice and in friendship; for in matters of justice, equality is primarily equality in worth and secondarily equality in quantity, while in friendship, equality is primarily equality in quantity and secondarily equality in worth. This is made clear when a great disparity in virtue, vice, resources, or something else comes about; for then the parties are no longer friends and do not even claim that they deserve to be. This is most evident in the case of the gods; for they are the most superior to us in all good things. But it is also clear in the case of kings; for people who are much inferior to them do not claim that they deserve to be their friends either, nor do worthless people claim that they deserve to be friends with the best or wisest ones. In cases like this there is no exact definition of the point up to which people can remain friends; for much can be taken away and the friendship will still last, but if the separation is large—for example, between us and a god—it no longer does.

1159^{a}1

And from this the puzzle arises as to whether friends really wish the greatest of goods for their friends (for example, that they be gods); for then they will no longer be friends to them, and hence not good things for them either; for friends are good things. If, then, we were correct to say that one friend wishes good things for the other for the other's own sake, it should be the case that the other remains whatever sort of thing he is. It is for him insofar as he is a human being, then, that he will wish the greatest goods. But perhaps not all of them; for it is most of all for himself that each person wishes good things.

8.8
Comparisons between the Forms of Friendship (3)

Ordinary people, because of their love of honor, seem to wish to be loved more than to love. That is why ordinary people love flattery; for a flatterer is a friend who is inferior, or pretends to be so, and to love more than he is loved. Being loved seems close to being honored, which is, of course, what ordinary people aim at.

It does not seem to be because of itself, however, that they choose honor, but rather coincidentally; for ordinary people enjoy being honored by those in positions of authority because of what they expect (for they think that if they need something, they will get it from these). It is as a sign of benefits to be received, then, that they enjoy the honor. Those who desire honor from decent and knowledgeable people, on the other hand, are aiming to confirm their own beliefs about themselves. What they enjoy, then, is that they are good, and that happens thanks to their trusting the judgment of those who say this. Being loved is something people intrinsically enjoy. That is why being loved would seem to be better than being honored, and friendship to be intrinsically choiceworthy.

But friendship seems to consist more in loving than in being loved. A sign of this is that it is in loving that mothers take enjoyment; for mothers sometimes give away their own children to be reared by others, and though they love them (knowing who they are), they do not seek reciprocal love (if love in both directions is impossible). Instead it seems enough for them to see that their children are doing well, and they themselves love their children even if these render up none of the things appropriate to a mother because of their ignorance.

Since friendship consists more in loving, however, and those who love their friends are praised, loving seems to be the virtue characteristic of friends, so that it is those in whom loving comes about in accord with worth who are stable friends and have a stable friendship. It is in this way that even unequals will best be friends; for in this way they would be equalized.

Equality and likeness is friendship, and most of all the likeness of those who are alike in virtue; for being stable in themselves, they also remain stable in relation to each other, and they neither need base services nor provide such services themselves, but even (one might almost say) prevent them; for it is characteristic of good people neither to commit errors themselves nor to allow their friends to do so. Depraved people, by contrast, do not have stability; for they do not remain even like themselves. Instead, they become friends for a short time, while they are enjoying each other's depravity.

Useful and pleasant people last longer as friends; for they do so for as long as they provide each other with pleasures or benefits. The friendship that exists because of utility, however, seems to come about most of all from contraries—for example, of poor for rich, or unlearned for knowledgeable; for whatever someone needs he seeks, giving something else as a present in return. Here we might also include lover and boyfriend, and beautiful and ugly. That is why lovers also sometimes appear ridiculous by thinking that they deserve to be loved in the same way as they love. If they are objects of love in a similar way, then, presumably they must think that they deserve this, but when they are nothing of the sort, it is ridiculous to do so.

Perhaps a contrary does not intrinsically desire its contrary, however, but rather does so coincidentally, and the desire is instead for the mean; for this is something good—for example, for what is dry the good is not to become wet but rather to reach

the mean, and similarly for what is hot and the rest. We may set aside these issues; for they in fact belong to another discussion entirely.[162]

8.9
Friendships in Different Communities

It does seem, as was said[163] at the start, that friendship and justice are about the same things and between the same people. For in every community there seems to be some sort of justice and some sort of friendship as well. At any rate, people address their fellow sailors or fellow soldiers as friends, and those in other sorts of communities do likewise. And the extent to which they share things communally is the extent of their friendship; for it is also the extent of justice. The proverb, "what friends have they have in common" is correct too; for it is in community that friendship lies.

But while brothers and companions have everything in common, others have only specified things—more in some cases, less in others; for some friendships are in fact greater in extent, others less. What is just differs too; for it is not the same for parents toward children as for brothers toward each other or the same for companions as for fellow citizens, and similarly in the case of the other sorts of friendships as well.

Injustice toward each of these, then, is also different, and grows when it is toward those who are more fully friends—for example, it is a more terrible thing to rob a companion of his money than to rob a fellow citizen, or not to give aid to a brother than not to give it to a stranger, or to strike one's father than to strike anyone else at all. Justice too naturally increases along with the friendship, as it is between the same people and has an equal extension.

All communities seem to be parts of the political community, however; for people consort together for some advantage and to provide themselves with something for their life. And the political community too seems both to have come together at the start and to remain in existence for the sake of what is advantageous; for legislators also aim to hit this, and what is for the common advantage is said to be just.

Other communities seek what is advantageous in some area—for example, sailors aim at what is advantageous on a voyage related to some moneymaking occupation or something of that sort, while fellow soldiers seek what is advantageous in war, whether money, victory, or taking a city; and similarly with members of tribes or demes. Some communities seem to come about because of pleasure, such as religious guilds and dining clubs; for these come about for the sake of sacrifices and companionship. All of these, however, seem to be subordinate to the political community; for it seeks not the advantage that is present at hand but the one that is for all of life {. . .}[164] performing sacrifices, arranging gatherings related to these, giving honors to

162. 1155^{b}1–9.
163. 1155^{a}22–28.
164. There is a lacuna in the text at this point.

the gods, and providing pleasure-involving relaxations for themselves. For ancient sacrifices and gatherings seemed to take place after the harvesting of the crops, as a sort of offering of first fruits; for it was at these times that people were most at leisure.

All these, then, are manifestly parts of the political community, and the various sorts of friendship will follow along with these sorts of community.

8.10
Constitutions

There are three forms of constitution and an equal number of deviations—destroyed versions, as it were—of these. The forms of constitution are kingship, aristocracy, and, thirdly, one based on property assessments, which it seems proper to call "timocracy," though most people usually call it a "polity."

Among these, the best is kingship, the worst timocracy. The deviation from kingship is tyranny; for though both are monarchies, they differ greatly; for the tyrant targets his own advantage, the king that of the ones he rules. For a person is not a king unless he is self-sufficient and superior in all good things, and the one like that needs nothing in addition and so would not target what benefits himself but what benefits those he rules; for the one who is not like this would be some sort of titular king. Tyranny is contrary to this; for the tyrant pursues what is good for himself. Also, it is more evident in its case that it is the worst, and the worst is what is contrary to the best.

There is constitutional change from kingship to tyranny; for the baseness characteristic of monarchy is tyranny, and a depraved king becomes a tyrant. There is change from aristocracy to oligarchy due to the vice of the rulers, who allocate what belongs to the city contrary to worth, giving all or most of the good things to themselves and offices always to the same people, considering the acquisition of wealth to be their most important concern. The rulers are few, then, and depraved people rather than the most decent ones. There is change from timocracy to democracy; for these are neighbors; for timocracy too is meant to be rule by the majority, and all those meeting the property assessment are equal. Democracy is least depraved; for it deviates only a little from the form of polity. Constitutions change, then, most of all in these ways; for these changes are smallest and easiest.

Resemblances—and, as it were, paradigms—of these constitutions can also be found in households. For the community of a father in relation to his sons takes the shape of a kingship; for it is for his children that a father cares; that is why Homer too calls Zeus "father"; for kingship is meant to be paternal rule. Among the Persians, however, the rule of a father is tyrannical; for they use their sons as slaves. Also tyrannical is the rule of a master in relation to slaves; for it is the advantage of the master that is served in it. But while this form of rule is apparently correct, the Persian form is apparently erroneous; for when the people ruled are different sorts, the rules are different.

The community of man and woman is apparently aristocratic; for the man rules in accord with worth and in those matters in which a man should rule, while whatever is fitting for a woman he gives over to her. If on the other hand the man controls everything, he changes it into an oligarchy; for he makes it contrary to worth and not insofar as he is better. Sometimes women rule because they are heiresses. Their rule, then, is not in accord with virtue but exists because of wealth and power, as in oligarchies.

The community of brothers is like a timocracy; for brothers are equals except insofar as they differ in age. That is why if their ages differ greatly, their friendship is no longer a brotherly one. Democracy, however, is found most of all in master-less habitations (for there everyone is on an equal footing), and in those in which the ruler is weak and everyone has authority.

8.11
Friendships in Different Constitutions

In each of the constitutions there is manifestly friendship to the extent that there is justice. The friendship of a king toward those he rules is in accord with his superiority as a benefactor; for he treats those he rules well, if indeed he is good, and supervises them to ensure that they do well, just as a shepherd does his sheep; hence Homer also calls Agamemnon "shepherd of the people."

Paternal friendship is also like this, but differs in the magnitude of the benefactions; for a father is a cause of existence (which seems to be the greatest service) as well as of nurture and education. And these services are attributed to ancestors too. It is by nature, moreover, that a father is fit to rule his sons, ancestors to rule descendants, and a king those he rules.

These friendships are in accord with superiority, which is also why parents are honored. What is just, then, in these relationships is not what is the same for the two parties but rather what is in accord with their worth; for the friendship is that way too.

Also, the friendship of a man for a woman is the same as in an aristocracy; for it is in accord with virtue, with a superior good going to the better and what is fitting going to each. And what is just is that way too.

The friendship of brothers is like companionate friendship; for they are equals and of an age, and people like that are for the most part similar in feelings and character. The friendship that accords with timocracy is like this too; for the citizens are meant to be equal and decent, ruling in turn and on equal terms. Their friendship, then, is that way too.

In the deviations, however, just as justice is found only to a small extent, so too is friendship, and it is found least in the worst one; for in tyranny there is little or no friendship. For in cases where there is nothing in common between ruler and ruled,

there is no friendship; for there is no justice either; for example, of craftsman toward instrument, soul toward body, or master toward slave. Benefited by their users all these things certainly are, but there is no friendship toward inanimate things nor justice either. Neither is there friendship toward a horse or a cow, or toward a slave insofar as he is a slave. For there is nothing in common between the parties; for a slave is an animate instrument, an instrument an inanimate slave. Insofar as he is a slave, then, there is no friendship toward him, but insofar as he is a human being there is; for there seems to be some sort of justice on the part of any human being toward anyone capable of participating in a community of law and convention, and of friendship too, then, to the extent that he is a human being.

There are friendships and justice to a small extent even in tyrannies, then, while in democracies they are found to a greater extent; for in the case of those who are equal, the things they have in common are many.

8.12
Friendships in Families

It is in community, then, that every friendship lies, as we said.[165] But we might distinguish the cases of familial and companionate friendship. Political friendships, by contrast, as well as tribal friendships, friendships between fellow sailors, and all friendships of this sort do seem to be more like communal ones; for they seem to be in accord with some sort of agreement. Guest-friendship might also be ranked with these.

Familial friendships also seem to be of many forms, although all derive from paternal friendship; for parents feel affection for their children as being something of themselves, and children feel it for their parents as being those they come from. But parents know better what has come from them than their offspring know that they have come from these. Also, the source from which it comes is more intimately related to the offspring than what comes to be is to what produced it; for what comes from something properly belongs to what it comes from (as a tooth or hair or whatever else does to what has it), while what something comes from does not properly belong to it at all, or does so to a lesser extent. Also, there is the quantity of time involved; for parents feel affection for their offspring straight from birth, while children feel it for parents when time has passed and they have acquired comprehension or perception. From these observations it is also clear why mothers love their children more.

Parents love their children, then, as they love themselves; for what has come from them is like another (by being separated from them) "themselves," and children love parents as being what brought them into the world. Brothers love each other as having

165. 8.9.

been brought into the world by the same parents; for because their relationship to their parents is one and the same, they become one and the same too. Therefore, we speak of "one and the same blood," "one and the same root," and the like. They are one and the same in some way, then, even though divided.

Joint nurture and being of an age are major factors in friendship; for "age makes for fellowship," and those who live intimately become companions. That is also why fraternal friendship and companionate friendship are similar. And cousins and other relatives derive their intimate attachment from that of brothers; for it exists because they come from the same ones. But some are more intimate and others more distant, depending on their closeness to or distance from their initial common ancestor.

The friendship of children toward parents, as of human beings toward gods, is as toward something good and superior; for they are the producers of the greatest goods and the cause of their existence and nurture as well as of their education, once born. And this form of friendship also includes pleasure and utility more than does the friendship of strangers, insofar as they have more of a common life.

Fraternal friendship has the features found in companionate friendship (most of all when the parties are decent, and generally when they are similar to one another) to the extent that brothers are closer kin to each other and feel affection for each other from birth, and to the extent that those who come from the same parents and have been jointly nurtured and similarly educated are more similar in character and their test of each other over time is longest and most certain. And among other relatives the features fitted to friendship are also proportional.

Between a man and a woman, friendship seems to hold by nature; for a human being seems to be by nature more couple-forming than political to the extent that household is prior to and more necessary than city, and reproduction is a characteristic more common to animals. With the other animals, their community only goes as far as reproduction, while human beings share a household not only for the sake of reproduction but also for the sake of various things necessary for life; for from the outset their works are divided, those of a man being different from those of a woman, so they assist each other by putting their special works into the common enterprise. Because of this, both utility and pleasure seem to be found in this form of friendship. It may also exist because of virtue, however, if both parties are decent; for there is a virtue characteristic of each, and they can enjoy something like this. And children seem to be a bond of union, which is why childless unions are more quickly dissolved; for children are a good common to both, and what is common holds things together.

As for how a man must live his life in relation to a woman, and generally speaking a friend in relation to a friend, there is apparently no difference between inquiring about this and inquiring about how to do so justly; for this is not the same, apparently, for a friend toward a friend as toward a stranger, a companion, or a classmate.

8.13
Complaints in Friendships in Accord with Equality

There are three sorts of friendship, as we said[166] at the start, and in each, some are friends in accord with an equality while others are so in accord with a superiority (for similarly good people become friends as do better ones and worse ones, and it is likewise with pleasant people too and those who become friends because of utility, who may be equal or different in the benefits they confer). Equal partners, then, must equalize their loving and everything else in accord with equality, while unequal ones must return what is proportional, given the sorts of superiority involved.

Complaints and grievances arise only or mostly in friendships that are in accord with utility, and reasonably so. For those who are friends because of virtue are eager to provide benefits for each other (for this is characteristic of virtue and friendship), and when that is what people are competing about, there can be no complaints or quarrels; for no one is repelled by someone's loving him or providing benefits for him, but rather insofar as he is a sophisticated person, he responds by providing benefits in turn. And the one who excels the other does not complain about his friend, because he gets what he is seeking; for each desires what is good.

Complaints scarcely ever arise, either, in friendships that exist because of pleasure; for what both parties desire they get at the same time, if they enjoy passing the time together. And a person who complained about someone who did not delight him would appear ridiculous, when he is free not to spend his days with him.

Friendship that exists because of utility, however, is prone to complaints; for since they are making use of each other for their own benefit, they always need more, thinking that they have less than is fitting, and raising a grievance that they are not getting as much as they need, though they claim that they deserve it. Those who are providing the benefits, on the other hand, are unable to provide as much as the recipients need.

It seems that just as justice is twofold, one sort unwritten and the other in accord with the law, so in the case of friendship in accord with utility, one sort is based on character and the other sort is legal. Complaints most arise, then, when the partners do not begin and dissolve their association in accord with the same sort of this friendship.

The sort that is legal is one on specified terms; one sort altogether consists in businesslike hand-to-hand exchange, the other is freer as to time, albeit based on a quid-pro-quo contract. In the latter, the debt is clear and not disputable, but the deferral of repayment is fitted to friendship. That is why in some places there cannot be judicial proceedings over these, but rather people think that those whose transactions were based on trust should be content with that.

166. 1156a6–7.

The sort that is based on character is not one on specified terms, but rather each gives a gift or whatever as to a friend, yet the giver claims that he deserves to get back an equal amount or more, on the supposition that he was not giving but making a loan.

In a case where one party does not begin and dissolve the association on the same terms, there will be complaint. (This happens because all or most people, while they wish for what is noble, deliberately choose what is beneficial. And while it is noble to provide a benefit not because it will be repaid, it is being the recipient of a benefaction that is beneficial.) **1163^{a}1**

If the recipient can, then, he must make a return of equal worth to what he has received and do so voluntarily (for he must not make the other party an involuntary friend). He must suppose, then, that he was in error at the start and received a benefit from someone he should not have received it from; for it was not from a friend or from someone doing it because of itself. And he must dissolve the association as if the benefaction had been provided on specified terms and agree that he would make repayment when he is able. But if he is unable, not even the giver would claim he deserves it. So if it is possible, he must repay. And at the start he must investigate from whom he is receiving benefactions and on what terms, so that he may either accept them on those terms or not.

It is disputable whether one should measure by the benefit to the recipient and make repayment in accord with that or measure by the beneficence of the giver. For recipients say that they got from the benefactors the sorts of things that were small things for the benefactors and that they could have gotten them from someone else—minimizing the matter. The givers, conversely, say they were the biggest things for them, could not have been gotten from others, and were given in times of danger or of similar sorts of need.

Is it, then, the recipient's benefit that is the measure of it when the friendship exists because of utility? For he was the one in need of it, and the giver assists him on the supposition that he will get an equal return. The assistance, then, has been precisely as much as the recipient has been benefited, and the recipient must repay, then, as much as he got out of it—or even more; for that is nobler.

In friendships in accord with virtue, on the other hand, there are no complaints. Rather, the measure would seem to be the deliberate choice of the giver; for the controlling element of virtue and character lies in deliberate choice.

8.14
Complaints in Friendships in Accord with Inequality

Disputes also arise in friendships in accord with a superiority; for each of the two parties claims that he deserves to have more, and when this happens the friendship is dissolved. For the better party thinks it appropriate that he have more; for more is

allocated to the one who is good. And the partner who confers greater benefits thinks similarly; for a useless person, they say, should not have an equal share; for then it becomes a charity and not a friendship, if what results from it is not in accord with the worth of the parties' works. For they think that just as in a community formed with a view to making money, where those who contribute more get more, so it should be in a friendship too. But the person in need, or the worse party, takes the converse position; for the work of the good friend is to assist those who are in need; for what, they ask, is the benefit of being the friend of an excellent person or one in a position of power if you are going to get nothing out of it?

It would seem that the thought of each party about his deserts are correct, and that more should be allocated to each of them from the friendship—not more of the same thing, however, but more honor to the superior party and more profit to the one in need; for honor is the reward appropriate to virtue and beneficence, while profit is the assistance appropriate to need.

It is apparently this way in constitutions as well; for the one who contributes nothing good to the community is given no honor; for what is communal is given to the one who benefits the community, and honor is something communal. For one cannot at the same time receive money from communal sources and receive honor. For no one endures getting the smaller share in everything. To the person who gets a smaller share of money, then, they allocate honor, and to the person willing to accept gifts, money; for what is in accord with worth equalizes and preserves the friendship, as we said.[167] This, then, is also how one must associate with unequals: the party who is benefited in regard to wealth or in regard to virtue must give honor in return, making what repayment he can.

For friendship seeks what is possible, not what is in accord with worth; for that is not even possible in all cases, such as in cases of honor to the gods or to parents; for here no one could ever make a return of equal worth, but the one who serves them as far as he can seems to be decent. That is why it would seem that a son is not free to disown a father, while a father is free to disown a son; for a debtor must repay, and since nothing a son has done is worthy of the benefits he has already received, he is always in debt. A creditor, however, is free to remit a debt, and so, then, is a father. At the same time, presumably, it seems that no one would disown a son who was not one utterly excessive in his depravity; for quite apart from their natural friendship, it is human not to reject assistance. For the son, however, if he is depraved, providing goods to his father is something to avoid or not take seriously; for while ordinary people wish to receive benefits, they avoid providing them on the supposition that they involve no gain.

So much, then, for our discussion of these issues.

167. Most recently at 1162b2–4, but also 1158b27–28, 1159a35–b2.

BOOK 9

9.1
Resolving Disputes That Arise in Friendship

In all friendships between people who are dissimilar, what is proportional equalizes and preserves the friendship, as we said.[168] For example, in political friendship the shoemaker gets a payment for his shoes in accord with their worth, and so does the weaver and the rest. In these cases, money is provided as a common measure, and so it is this, then, that everything is referred to and measured by.

In sexual friendships, however, the lover sometimes complains that while his own love is beyond measure, he is not reciprocally loved (even when, as it happens, he has nothing lovable about him), while the boyfriend complains that his lover had earlier promised everything but now delivers nothing. These sorts of things happen when the lover loves the boy because of pleasure, while the boy loves him because of utility, and they do not both provide these. For when a friendship exists because of these, it is dissolved when the things for whose sake they loved do not occur; for it was not the parties themselves who were the object of affection but their qualities, which were not stable. That is why such friendships are not stable either. But friendship of character, because it is intrinsic friendship, does endure, as we said.[169]

Disputes arise when the things the parties get are different and not what they desire; for it is like getting nothing at all when we do not get what we seek. Consider, for example, the man who promised a lyre player that the better he played the more he would get, but when dawn came and the lyre player asked for what the man had promised, the man said that he had given pleasure in return for pleasure. If this was what each of them had wished, that would have been enough. But if one wished for delight, the other for profit, and the one has what he wished for while the other hasn't, matters conducing to their community would not be correctly arranged; for it is what each person happens to need that he is in fact intent on—at any rate, it is for this that he gives what he does.

Which of them is to fix the worth: the one who gives first or the one who gets first? For the one who gives first would seem to turn it over to the other. This is precisely what they say Protagoras used to do; for whenever he taught anything at all, he used to invite the learner to assess how much the things he got to have scientific knowledge of seemed to be worth and accepted that amount. But in cases like this, some people prefer the saying, "to a man his wage."[170] It makes perfect sense that those who get the money first and then do none of the things they said they would do, because of the extreme nature of their promises, are subject to complaint; for they do not deliver

168. Most recently at 1163ᵇ11–12.
169. 1159ᵃ35–ᵇ7.
170. Hesiod, *Works and Days* 368.

what they agreed to. This, however, is what the sophists are presumably compelled to do, because no one would pay them money for what they do scientifically know. So they take the wage, do not do what they said, and—as makes perfect sense—get involved in complaints. But where there is no contract of services to be rendered, those who, because of the other parties themselves, give first are not subject to complaint, as we said[171] (for this is characteristic of friendship in accord with virtue). And the payment for it must be in accord with deliberate choice (for this is characteristic of a friend and of virtue). This, it seems, is also the way it must be when the parties have formed a community for the purposes of philosophy; for the worth of philosophy is not measured in money, nor would honor serve as its counterweight, but it is perhaps enough—as in the case of gods and parents—to do what we can.

If the giving is not of this sort but with a view to some return, presumably the return should ideally be one that each of them thinks to be in accord with worth. But if they do not agree on this, it would seem to be not only necessary but also just that the one who gets first should fix its worth; for if the giver got in return as much benefit as the receiver did, or as much as the receiver would have given for the pleasure, the giver would get a worthy return.

For in buying and selling, indeed, this is apparently what happens. And in some places there are laws prohibiting judicial proceedings in voluntary transactions, on the supposition that one should dissolve a community with someone one trusted in the same way as one formed it. For the law considers it more just for the person to whom something is turned over to fix its worth than for the person who turns it over to do so. For most things are not priced equally by those who have them and those who wish to get them; for to each party their own belongings and the things they give appear to be worth a lot. Nonetheless, payment is made in whatever amount is fixed by the ones who get them. But presumably the price should not be what a thing appears to be worth once the getter has it but the price he put on it before he had it.

9.2
Puzzles about the Demands of Different Friendships

Puzzles also arise in cases of the following sort. Whether, for example, a person should allocate everything to his father and obey him in everything or put his trust in a doctor when he is sick and elect as a general someone capable in warfare; or, similarly, whether he must do a service for a friend rather than for an excellent person and return a favor to a benefactor rather than do one for a companion, if he cannot do both.

All such matters are difficult to determine with any exactness, aren't they? For they involve all sorts of differences both in greatness and smallness and in nobility

171. 1162b6–13.

and necessity. But that one must not return everything to the same person is not unclear; and one must for the most part return benefactions rather than do a favor for a companion, just as one must repay a loan to the person to whom we owe it rather than give freely to one's companions. But presumably not even this is always so—for example, must someone who has been ransomed from pirates ransom his ransomer in return, whomever he is (or if the latter has not been captured but is asking to be paid, repay him), or must he ransom his father? For it would seem that one must ransom one's father rather than even oneself.

Precisely as we said,[172] then, speaking in universal terms, one must repay the debt, but if giving would greatly exceed repaying either in nobility or in necessity, one must incline toward that. For sometimes even the return of a previous service is not equal to it, when one party knows he is benefiting someone excellent, while the other would be returning it to someone he thinks is depraved. For sometimes one must not reciprocate by lending to someone who has lent to you; for he lent to you as someone who is decent, thinking he would be repaid, while you do not expect that you would be repaid by a wicked person. If the situation is truly like that, then, the worth of the parties is not equal. And even if it is not like that, but they think it is, what they do would not seem strange. Precisely as we have often said, then, accounts concerned with feelings and actions have the same determinateness as the things they are concerned with.

That one must not return the same things to everyone nor everything to one's father, just as one does not make all one's sacrifices to Zeus, is not unclear. And since different things are repaid to parents, brothers, companions, and benefactors, one must allocate to all what properly belongs to them and is fitting. And this is manifestly what people in fact do; for to weddings they invite their relatives; for these have a share in the family and so, then, in the actions that concern it. And funerals too, people think, should be attended by relatives more than anyone else, because of the same consideration.

It would seem that in matters of sustenance one should assist parents most, on the grounds of owing them this, and that it is a nobler thing to assist the causes of our existence in this way than to assist ourselves. And honor too, it would seem, one should give to parents just as to the gods—but not every sort of honor; for one should not even give the same honor to a father as to a mother (nor, again, as to the wise person or the general), but rather the paternal sort and the maternal sort respectively.

To all older people too one should give honor in accord with their age, by standing up, finding them a seat, and so on. With companions and brothers, on the other hand, one should be free speaking and share everything. And to relatives, fellow tribesmen, fellow citizens, and all the rest one must always try to allocate what properly belongs to them, and to make comparative judgments about the things accruing to each in accord with kinship, virtue, or use.

172. Most recently at 1164^{b}27–28.

The comparative judgment is certainly easier with people of the same kind and harder work with those of different kinds. Yet we must not abandon the task because of this, at any rate, but rather to the extent possible make such determinations as far as we can.

9.3
Puzzles about Dissolving Friendships

There is also a puzzle about whether or not to dissolve friendships with those who do not remain the same. Or is there, as regards those who are friends because of utility or pleasure, nothing strange if the friendships are dissolved when the friends no longer have the relevant qualities? For it was because of these qualities that they were friends, and when these depart, it is reasonable not to love. But someone might complain if a person who liked him because of utility or pleasure pretended to do so because of his character. For, as we said at the start, most differences arise between friends when the way in which they think they are friends is not the same as the way in which they are friends.[173]

When someone has deceived himself and supposed that he was being loved because of his character, although the other was doing nothing of the sort, he would hold himself responsible. But when he is deceived by the other's pretenses, he is justified in complaining about his deceiver—more so even than about those who counterfeit currency, inasmuch as the malice concerns something more estimable.

If one accepts another person as a friend for being good, however, and then he becomes depraved and seems so, must one still love him? Or is that not possible, if indeed not everything is an object of love, but rather the good? The wicked, by contrast, is neither an object of love nor should be one (for a lover of wickedness one must not be, nor must one become like the base person, and like, we said,[174] is friend to like). Must one, then, dissolve the friendship immediately? Or not in all cases but only when the friends are incurable in their depravity? If they do admit of rectification, one must aid them more with their character than with their property, inasmuch as that is a better thing and more properly belongs to friendship. The person who did dissolve such a friendship, however, would seem to be doing nothing strange; for it was not to a person of that sort that he was a friend. When his friend has changed, then, and he is unable to restore him to what he was, he leaves him.

But if the one friend remained the same while the other became more decent and greatly different in virtue, must the second treat the first as a friend? Or is that not possible? When the distance between them is large, the answer becomes most clear—for example, in childhood friendships; for if one friend remained a child in

173. Perhaps 1164a13–14, but nothing exactly like this has been said.
174. 1156b19–21, 1159b2–3.

thought, while the other became a man of the best sort, how could they be friends, when they are neither satisfied with the same things nor find the same things enjoyable or painful? For not even with regard to each other will this be so, and without it, as we saw, they cannot be friends; for they cannot share a life. We have talked about these things.[175]

Must one, then, behave no differently toward someone in a case like this than if he had never been one's friend at all? Surely, one should retain a memory of the former intimacy, and just as we think favors should be granted to friends rather than strangers, one must in the same way allocate something to former friends too, because of the former friendship, when the dissolution does not occur because of extreme depravity.

9.4
Friendship and Self-Love

1166ᵃ1 The features fitted to friendships toward neighbors, and those by which the various friendships are defined, seem to derive from the features of a person's friendship toward himself. For people take a friend to be someone who wishes and does what is good or what is apparently good for the sake of the other, or someone who wishes his friend to exist and live for the friend's own sake—precisely the way mothers feel about their children, and friends who are irritated with each other. And others take a friend to be someone who passes the time with his friend and makes the same choices as he does, or suffers and enjoys together with him—this also happens most with mothers. It is by one or other of these features that people also define friendship.

And each of these features is found in the decent person's relation to himself, and in that of all other people insofar as they suppose themselves to be decent (but, as we said,[176] virtue and the excellent person would seem to be the measure in each case); for this sort of person is of one mind with himself and desires the same things with all his soul, and wishes, then, what is good for himself and what appears good, and does the pertinent actions (for it is characteristic of a good person to work hard at what is good) and does it for his own sake (for he does it for the sake of the thinking part in him, which is precisely what each person seems to be). Also, he wishes himself to live and be preserved and most of all [the part of himself] with which he thinks. For existence is a good thing for an excellent person, and each person wishes the good things to himself. But no one chooses to have everything if it is by becoming someone other than himself (for even as things stand the god has the good). Rather, he chooses to have it while being whatever it is that he is. But each person would seem to be his understanding part, or it most of all.

175. 1157ᵇ17–24, 1158ᵇ33–35.
176. 1113ᵃ29–33.

And such a person wishes to pass the time with himself; for he does so pleasantly; for his memories of what he has done are agreeable and his expectations for the future are good, and memories and expectations like that are pleasant. His thought too is well supplied with objects of contemplation. And he, most of all people, suffers and is pleased together with himself; for it is always the same thing that is painful or pleasant, not different ones at different times; for he is (one might almost say) without regrets.

The decent person, then, has each of these features in relation to himself and is related to his friend as he is to himself (for his friend is another himself), and friendship seems to be [defined by] one or other of these features, and friends to be those who have them.

Whether there is or is not friendship toward oneself, however, is a question we may set aside for the present.[177] But, on the basis of the features we mentioned, there would seem to be friendship, insofar as a person is two or more things, and because the extreme of friendship resembles friendship toward oneself.

The features we mentioned, however, are apparently also found in ordinary people, base though they are. Is it, then, only insofar as they are satisfied with themselves and suppose themselves to be decent that they share in these? Certainly no one who is altogether base and impious in his actions has them or even appears to.

It is pretty much the case indeed that base people do not have them either; for they are at odds with themselves and, having an appetite for one lot of things, wish for another, the way people who lack self-control do; for instead of the things they themselves think to be good, they choose pleasant ones that are actually harmful, while others again, because of cowardice or idleness, shrink from doing the actions they think best for themselves. Those who have done many terrible actions because of their depravity hate and even flee from living, and[178] do away with themselves.

Besides, depraved people seek others with whom to spend their days but flee from themselves; for when they are by themselves they remember many repellent things and expect others like them in the future, while when they are with others they forget these. And since they have nothing lovable, they feel nothing that is a mark of friendship toward themselves. Neither, then, do people like this enjoy or suffer together with themselves; for their soul is torn by faction, and one element in it, because of its depravity, suffers at being held back from certain things, while the other is pleased, and so one pulls this way and the other that, as if tearing him asunder. And even if it is not possible to be pained and pleased at the same time, still, after a bit, he is pained that he was pleased and he wishes that these things had not become pleasant to him; for base people are full of regret.

The base person, then, is apparently not so disposed as to be fitted for friendship even toward himself, because he has nothing lovable. If, then, to be in that state is

177. 9.8.

178. Reading μισοῦσί τε καὶ.

to be utterly wretched, one must avoid depravity with all one's might and try to be decent; for that way one would both be fitted to friendship toward oneself and become friend to another.

9.5
Friendship and Goodwill

Goodwill seems to be fitted to friendship, but friendship it is surely not; for goodwill arises even toward people one does not know and without their being aware of it, while friendship does not. We also said this before.[179] Neither is goodwill even a way of loving. For it does not include intensity of feeling or desire, while in the case of loving these do follow along. Also, loving involves intimacy, while goodwill can arise all of a sudden—as it does, for example, toward athletic contestants; for people come to have goodwill for them and to share in their wishes, but would never join in their actions; for people come to have goodwill all of a sudden, precisely as we said, and to feel an affection that is superficial.

Goodwill seems, then, to be a starting-point of friendship, just as the pleasure from sight is the starting-point of sexual love; for without first being pleased by the appearance of the other, no one falls in love, but someone who does enjoy another's appearance is none the more in love unless he also longs for the other when he is absent and has an appetite for his presence. In the same way too, then, it is not possible for people to be friends without first having goodwill, but those who have goodwill are none the more friends; for they only wish good things to those for whom they have goodwill, but would never join in their actions or go to any trouble on their behalf. Hence, by transference of the term, we might say that goodwill is inactive friendship, which—if it lasts through time and arrives at intimacy—becomes friendship.

This is not the friendship that exists because of utility, however, nor the one that exists because of pleasure; for even goodwill does not arise on the basis of these. For a person who has received a benefaction and allocates goodwill in return for what he has received does what is just. But a person who wishes another person to do well, expecting to get resources through him, seems to have goodwill not toward him but more toward himself, just as he is not a friend, either, if he takes care of another because of some use to be made of him.

Goodwill arises, on the whole, because of virtue and some sort of decency—when one person appears to another to be noble, brave, or something like that—just as in the case of the contestants we mentioned.[180]

179. 1155^{b}32–1156^{a}5, 1158^{a}4–10.
180. 1166^{b}35.

9.6
Friendship and Concord

Concord too is apparently something fitted to friendship. That is why it is not agreement in belief; for that might occur even among people who do not know each other. Neither are people said to be in concord when they are of one mind about just anything—for example, on matters related to the heavens (for concord concerning these is not fitted to friendship). On the other hand, we do say that a city is in concord when people are of one mind about the things that are advantageous, deliberately choose the same things, and put into action the things they have resolved in common.

Things doable in action, then, are what concord is concerned with, and of these, the ones that have a certain magnitude and where it is possible for both or all parties to attain them. Cities are in concord, for example, when all resolve to have offices be elective, to form an alliance with Sparta, or to have Pittacus rule (when he too is willing to do so). But when each of the two parties wishes the rule for himself, like those in the *Phoenician Women*,[181] they factionalize; for it is not concord when each of the two parties thinks the same thing, whatever it may be, but rather when they think it in connection with the same party (for example, when both the common people and the **1167b1** decent ones think that the best people should rule); for that way all the parties get what they are aiming at. Concord is apparently political friendship, then, as it is in fact said to be; for it is concerned with things that are advantageous and ones that affect our life.

This sort of concord is found among decent people; for they are in accord both with themselves and with others—out for the same things, one might almost say (for the wishes of such people remain the same, and do not ebb and flow like a tidal race). And they wish for just things as well as advantageous ones, and these they also seek in common.

Base people, however, cannot be in concord, except to a small extent, any more than they can be friends, since they aim at a greedy share in benefits, but in labors and charitable services a deficient one. And since each one wishes these things for himself, he keeps an eye on his neighbor and stands in his way, with the excuse that if people do not keep watch, the common good gets ruined. The result is that they factionalize, compelling each other to do just things but not wishing to do them themselves.

9.7
Benefactors and Beneficiaries in Friendships

Benefactors seem to love their beneficiaries more than those who have been benefited love the givers, and this is investigated on the supposition that it is contrary to reason for it to happen. To most people it appears that one lot are debtors, the other

181. Euripides.

lot creditors. Just as in the case of a loan, then, where debtors wish their creditors did not exist anymore, while creditors even take care to preserve the safety of their debtors, in the same way it is thought that benefactors wish their beneficiaries to exist as providers of gratitude, while the beneficiaries are careless about making the return. Epicharmus would perhaps claim that most people say this because "they are looking at the matter from a wicked person's point of view,"[182] yet it would seem to be a human trait; for ordinary people are forgetful and aim to receive benefits more than to confer them.

But the cause would seem to be more natural than that, and the case concerning creditors would seem to be not even a similar one; for it does not involve a way of loving on their part, but rather a wish to safeguard their debtors for the sake of recovering a debt. Benefactors, by contrast, love and like their beneficiaries even if they are of no use to them and would not become so later.

Precisely the same happens in the case of craftsmen too; for all of them like their own work more than they would be liked by it if it became animate. But perhaps this happens most where poets are concerned; for they have an excessive liking for their own poems, feeling affection for them as for children.

1168ᵃ1

This, then, is the sort of case that the one of the benefactors actually resembles; for the fact that someone has been benefited is their work. It, then, they like more than the work does its producer. The cause of this is the following: existence is choiceworthy and lovable for everyone; we are by being in activity (for we *are* by living and doing actions); and the producer in activity is in a way the work. He feels affection for his work, then, because he feels affection for existence too. And this is natural; for what he is in potentiality, his work manifests in activity.

At the same time, to the benefactor, what is in accord with his action is noble, so that he enjoys the person in whom it occurs. The person acted on, by contrast, finds nothing noble in the agent, but, if anything, something advantageous, and this is less pleasant and less lovable.

What is pleasant, however, when it belongs to the present is activity; when it belongs to the future is expectation; and when it belongs to the past is memory. But what is most pleasant—and similarly most an object of love—is what is in accord with activity. For the person who has produced something, his work endures (since what is noble is long lasting), while for the person acted on, the utility passes away. As for memory, that of noble things is pleasant too, while that of useful ones is scarcely pleasant at all or less so; although the reverse would seem to hold of expectation. Also, loving something is like producing something, while being loved is like having something done to you. And it is for those who exceed where action is concerned that loving and the features fitted to friendship follow.

Further, everyone feels more affection for those things that come about by his painful labor—for example, in the case of money, those who have made it more than

182. Otherwise unknown.

those who have inherited it. To be benefited, though, seems to involve no painful labor, while to confer benefits seems like hard work. It is also because of these factors that mothers are the more child-loving ones; for giving birth involves more painful labor, and they know better that the children are their own. This feature too seems to properly belong to benefactors.

9.8
Puzzles about Self-Love

There is also a puzzle about whether one should love oneself most or someone else. For people admonish those who like themselves most, calling them "self-lovers," on the supposition that this is actually something shameful. It seems too that the base person does all his actions for the sake of himself, and the more depraved he is the more he does so—people complain, therefore, that he "does nothing from himself."[183] The decent person, by contrast, seems to act because of what is noble, and the better he is the more he does so, and for the sake of a friend, disregarding his own interests.

With these accounts, however, our results clash—which is not surprising. For they say that one should love most the person who is most a friend, and the person who is most a friend is the one who wishes good things for the one for whom he wishes them and wishes them for the latter's own sake, even if no one will know. But these features are found most in one's relations to oneself, as of course are all the others by which a friend is defined; for, as we said, it is from oneself that all the features fitted to friendship also extend to others. All the proverbs are also of one mind about this—for example, "one soul,"[184] and "what friends have they have in common," and "equality is friendship," and "knee is closer than shin";[185] for all these things are found most in one's relations to oneself; for one is a friend to oneself most of all, and must, then, love oneself most.

It is reasonable to be puzzled, then, as to which side one must follow, since both carry conviction. Presumably, in cases like these we need to draw distinctions in connection with the arguments, and determine to what extent and in what ways they grasp the truth. If, then, we were to find out what those on each side mean by "self-love," perhaps that would be clear.

Those who reduce it to a term of reproach call "self-lovers" those who allocate to themselves the greater share in money, honors, and bodily pleasures; for these are the things ordinary people desire and take seriously, on the supposition that they are the best goods—which is why they are fought about. Those people, then, who are greedy for these things gratify their appetites and their feelings and the non-rational part of

183. The precise meaning is obscure, but presumably cognate with "disregarding his own interests."

184. Euripides, *Orestes* 1046.

185. Theocritus, *Idylls* 16.18. Like our "Charity begins at home."

the soul generally. And ordinary people are like this, which is why the term has come about, deriving from the most ordinary case, which really is a base one. Those who are self-lovers in this way, then, are justly objects of reproach.

That it is those who allocate goods of this sort to themselves that most people are used to calling "self-lovers" is not unclear; for if someone were always taking more seriously than anything else the doing of just actions, or temperate ones, or whatever else might be in accord with the virtues, and in general were always keeping for himself what is noble, no one would call this person a "self-lover" or blame him.

But this sort of person would seem to be more of a self-lover. At any rate, he allocates to himself the good things that are noblest, and the ones that are best of all, and gratifies the element in himself that has most control, obeying it in everything. But just as a city too, or any other complex system, seems to be most of all its most controlling part, so also does a human being. The person is most of all a self-lover, then, who likes this part and gratifies this part.

Also, a person is called "self-controlled" or "lacking in self-control" depending on whether or not his understanding is in control, on the supposition that this is what each person is, and it is actions involving reason that people seem most of all to do themselves and to do voluntarily. It is not unclear, then, that this part is what each **1169^{a}1** person is or is most of all and that the decent person likes this part most.

That is why the decent person is most of all a self-lover, but of another form than the one that is reproached and differing from it as much as living in accord with reason does from living in accord with feeling, and as much as desiring the noble, on the one hand, does from desiring the seemingly advantageous, on the other.

Those, then, who take especially seriously the doing of noble actions are welcomed and praised by everyone. And if everyone competed for what is noble and strived to do the noblest actions, everything would be as it should as regards the common good, and each person as an individual would have the greatest of goods, if indeed virtue is such. So the good person should be a self-lover (for by doing noble actions he will both profit himself and benefit others), while the depraved person should not be one (for he will harm both himself and his neighbors through following his base feelings).

In the case of the depraved person, the things he should do clash with the ones he does, while the things the decent person should do are the very ones he does; for every understanding chooses what is best for itself, and a decent person obeys his understanding.

It is true of the excellent person too that he does many actions for the sake of his friends and his fatherland, even dying for them if need be; for he will give up wealth, honors, and fought-about goods generally, in keeping what is noble for himself; for he would choose intense pleasure for a short time over weak pleasure for a long one, living life nobly for a year over many years lived in random fashion, and a single noble and great action over many small ones. This is presumably what happens with those who die for others. They are choosing, then, something of great nobility for themselves. And they would give up wealth on the condition that their friends get

more; for while the friend gets wealth, the excellent person himself gets what is noble. The greater good, then, he allocates to himself.

As regards honors and ruling offices, he is the same way; for he will give up all these for his friend; for this is noble and praiseworthy for himself. It makes perfect sense, then, that he seems excellent, choosing as he does what is noble before anything else. But it may be that he will even give up actions in favor of his friend, and that it is nobler to be the cause of his friend's doing the action than to do the action himself.

In the case of every praiseworthy thing, then, the excellent person manifestly allocates the greater share of what is noble to himself. In this way, then, one should be a self-lover, as we said.[186] But in the way ordinary people are, one must not.

9.9
Does a Happy Person Need Friends?

There is also a dispute regarding the happy person as to whether he will need friends or not. For people say that those who are blessed and self-sufficient have no need of friends at all; for they already have the things that are good, and being self-sufficient, then, they need nothing in addition, while a friend, being another oneself, provides the things that one is unable to provide by oneself. Hence the saying, "when your *daimôn* does well (*eu*) by you, what need of friends?"[187]

It seems strange to allocate all the good things to the happy person and yet not to grant him friends, who seem to be the greatest of external goods. And if it is more characteristic of a friend to confer benefits than to receive them, and if it is characteristic of the good person and of virtue to do the benefiting, and if it is nobler to confer benefits on friends than on strangers, the excellent person will need people to receive his benefits. That is also why the question is asked about whether it is in good luck that friends are needed more or in bad luck, on the supposition that in times of bad luck we need benefactors and in times of good luck people to confer benefits on.

It is presumably strange too to make a blessed person live a solitary life; for no one would choose to have every good thing yet be by himself; for a human being is a political being and one whose nature is to live with others. To one who is happy, then, this also applies; for he has the natural goods. But clearly it is better to spend his days with friends and decent people than with strangers and random ones. Therefore, the happy person does need friends.

What, then, are the first lot claiming and in what way are they grasping the truth? Or is it that ordinary people think friends are those who are useful? But of friends of this sort, the blessed person will have no need, since he already has the things that are good. Neither, then, will he need (or only to a small extent) the ones who are friends

186. 1169a11–12.
187. Euripides, *Orestes* 667.

because of pleasure (for his life, being pleasant, has no need of adventitious pleasure). And because they do not need friends of these sorts, they seem not to need friends at all.

But this is presumably not true. For we said[188] at the start that happiness is a sort of activity, and it is clear that an activity is something that comes to be and does not belong to us like some possession. But if being happy lies in living and engaging in activity, and if the activity characteristic of the good person is intrinsically excellent and pleasant (as we said[189] at the start), and if things that are properly our own are among the things that are pleasant, and if we are better able to contemplate our neighbors than ourselves, and their actions than those that are properly our own, then the actions of excellent people who are their friends are pleasant to good people (for they have both of the features that make them by nature pleasant). The blessed person, then, will need friends of this sort, if indeed he deliberately chooses to contemplate decent actions that are properly his own, and the actions of a good person who is a friend are like this.

People think too that the happy person must be living pleasantly. But for a solitary person life is difficult; for it is not easy for him, when all by himself, to be continuously engaged in activity, while together with others and in relation to others it is easier. His activity, then, is more continuous, being intrinsically pleasant, as it must be for the blessed person; for the excellent person, insofar as he is excellent, enjoys actions that are in accord with virtue, but is repelled by those that stem from vice, just as the musician enjoys noble melodies and is pained by those that are base. A sort of training in virtue also comes about from living together with good people, as Theognis says.[190]

If we investigate the matter in a way more appropriate to natural science, the excellent friend seems to be naturally choiceworthy for an excellent person. For, as we said, what is by nature good is intrinsically good and pleasant for the excellent person. Living is defined in the case of animals by a capacity for perception and in the case of human beings by a capacity for perception or understanding. And a capacity is brought back to its activity, so that in the strict sense the thing resides in the activity. Living in the strict sense, then, seems to be [actively] perceiving or understanding. Living, however, is among the things that are intrinsically good and pleasant; for it is something determinate, and being determinate is characteristic of the nature of the good. And what is by nature good is also good for the decent person, which is why it seems pleasant to everyone. (But we should not take as an example a way of living that is depraved and destructive or one spent in pain; for living like that is indeterminate, as are the qualities that belong to it. In what follows, however, matters concerning pain will be made more evident.)

188. 1098^{a}16–20, 1098^{b}30–31.
189. 1099^{a}13–15, 21–24.
190. 1172^{a}13–14.

But if living itself is good and pleasant (as it seems to be from the very fact that everyone desires it, and decent and blessed people most of all; for life is more choiceworthy for them and living more blessed), and if a person who sees perceives that he sees and one who hears perceives that he hears and one who walks perceives that he walks, and if in the other cases too there is similarly something that perceives that we are in activity, so that if we are perceiving, we perceive that we are perceiving; and if we are understanding, we are perceiving that we are understanding; and if perceiving that we are perceiving or understanding is perceiving that we are existing (for existing, we said, consists in perceiving or understanding), and if perceiving that **1170b1** we are living is one of the things that is intrinsically pleasant (for living is something naturally good, and perceiving what is good to be present in ourselves is pleasant), and if living is choiceworthy and most so for good people, because for them existing is good and pleasant (for they take pleasure in being co-perceivers of what is intrinsically good), and if in the way an excellent person is related to himself he is also related to his friend (for a friend is another himself), then just as his own existing is choiceworthy for each one, so—or to much the same extent—is that of his friend too. But, as we saw, his existence is choiceworthy because he perceives himself as being good, and such perceiving is intrinsically pleasant. He must, therefore, also co-perceive his friend's existence together with his own—something that comes about in their living together and sharing in talk and thought; for this is what living together would seem to mean in the case of human beings and not, as in the case of cattle, grazing in the same place.

If, then, existence is intrinsically choiceworthy for the blessed person (for it is by nature good and pleasant), and to much the same extent that of his friend is too, his friend would also be among the things that are choiceworthy. But what is choiceworthy for him he must have, or else he will be in this respect lacking. Therefore, someone who is to be happy will need friends who are excellent.

9.10
How Many Friends Should We Have?

Must we, therefore, make as many friends as possible? Or, as in the case of guest-friendship, where it has been appropriately said, it seems, that one should be "neither many-guest-friended nor guest-friendless,"[191] is it the case in friendship too that it is appropriate to be neither friendless nor excessively many-friended?

With friends made with a view to utility, the saying would indeed seem to be entirely appropriate; for to reciprocate many people's services is a laborious task and a lifetime is not enough to do so. More of them, then, than are enough for one's own life are superfluous and a hindrance to living in a noble way. Hence one has no need

191. Hesiod, *Works and Days* 7.

of them. As for friends made with a view to pleasure, a few are sufficient, just like seasoning in nourishment.

But what about excellent people? Should one have as many as possible as friends or is there some measure for the number of friends, as there is for the number of people in a city? (For a city cannot come about from ten people, and if there are ten times ten thousand, it is a city no longer.) Presumably, the number is not a single number, but rather anything between certain determinate limits. Of friends too, then, there is a determinate number—perhaps the largest number a person could be living together with (for living together, we found, is most fitted to friendship).

That a person cannot both live together with a large number of people and parcel out himself among them is not unclear. Further, they too must be friends with each other, if all of them are going to be spending their days together, but this is hard work in a large group. It is also difficult for a large number of people to enjoy together and suffer together as if they were each other's own kin; for it is likely that being pleased together with one person and grieving together with another will both occur at the same time. Presumably, then, it is well not to seek to be too many-friended, but rather to have just as many friends as are enough for living together; for it would not seem even possible to be intensely friendly with a large number of people, which is why we cannot be in love with more than one person; for sexual love tends to be a sort of excessive friendship, and that excess is toward one person. Intense friendship, then, is toward few.

This also seems to be confirmed by the things at issue; for it just does not happen that many people become friends in accord with companionate friendship, and the cases celebrated in song are between two people. Those who are many-friended, on the other hand, and treat everyone they meet as if they were their own kin, seem to be friends with no one, except in a political way—in fact, people call them "ingratiating." In a political way, certainly, it is possible to be a friend to many people and yet not be ingratiating, but rather truly decent. But to be a friend to many people because of virtue and because of the friends themselves is not possible, and it must content us to find even a few friends like that.

9.11
Friends in Good Luck and in Bad

Do we need friends more in good luck or in bad? For they are sought after in both; for the unfortunate need assistance and the fortunate need people to share a life with and to benefit; for they wish to do well. Friendship is more necessary, then, in bad luck, which is why useful friends are needed there. But it is more noble in good luck, which is why we also seek decent friends; for it is more choiceworthy to confer benefactions on them and pass the time with them.

In fact, even the very presence of friends is pleasant in good luck and in bad too. For our pain is alleviated when friends share our suffering. That is why someone might even be puzzled about whether they, as it were, share our burden, or whether—without this happening—the pleasantness of their presence and the thought of their sharing our suffering lessens the pain. Whether it is indeed because of these factors or because of something else that the alleviation occurs is a puzzle we may set aside. At any rate, what we have described manifestly does happen.

It seems that their presence is a sort of mixture. For the very seeing of friends **1171b1** is pleasant, most of all in bad luck, and comes as a sort of assistance aiming at our not feeling pain (for a friend is someone who consoles us, both by the sight of him and by his words, if he is dexterous, for he knows our character and the things that please and pain us). But to see him pained at our strokes of bad luck is painful; for everyone tries to avoid being a cause of pain to his friends. That is why people with a manly nature are wary of making their friends share their pain. And if he does not go to extremes in his painlessness, a manly person cannot endure the pain that ensues for them and in general does not allow fellow mourners, because he is not himself prone to mourning. But the weaker sex and men who are like them enjoy having people to weep with and love them as friends who share their suffering. It is clear, however, that one should imitate the better person in everything.

In good luck, by contrast, the presence of friends brings with it both a pleasant way of passing the time and the pleasant thought that they are pleased at the good things that are ours. That is why it would seem that we should eagerly invite our friends to share our strokes of good luck (for to be a ready benefactor is a noble thing), but be hesitant to invite them to share our strokes of bad luck (for we should share bad things as little as possible)—hence the saying, "My own strokes of bad luck are enough."[192] We must most of all summon our friends to our aid, however, when with little trouble to themselves they are likely to benefit us greatly.

Conversely, it is presumably fitting to go uninvited to the aid of those having bad luck and to do so eagerly (for it is characteristic of a friend to confer benefits, most of all on those who are in need and have laid no claim to them; for this is nobler and pleasanter for both parties). But when they are having good luck, though we should go eagerly when it is a matter of working together (for one needs friends for this too), we should do so in a leisurely fashion when there are benefits to be received; for it is not a noble thing to be eager to receive benefits. On the other hand, one must presumably be wary of getting a reputation for unpleasantness by rejecting them (which indeed sometimes happens).

The presence of friends, then, is apparently choiceworthy in all circumstances.

192. Source unknown. It is very close, however, to Euripides' *Orestes* 240.

9.12
Living Together

What those who are in love like most is the sight of the beloved, and choose this sort of perception over all the rest on the supposition that their love depends most on it for its existence and its coming to be. Therefore, isn't it that way with friends too, so that living together is most choiceworthy? For friendship is a community, and as a person is related to himself, so he is related to his friend as well. Where he himself is concerned, however, the perception that he exists is choiceworthy; so it is too, then, where his friend is concerned. But this perception's activity comes about in living together, so it makes perfect sense that this is what friends aim at.

And no matter what existing consists in for each sort of person, no matter what **1172[a]1** they choose to be living for the sake of, it is this they wish to pass their time doing in the company of their friends. That is why some drink together, some play dice together, while others train together, hunt together, or do philosophy together, each sort spending their days together in whatever they most like in life; for since they wish to be living together with their friends, they do those actions and share in those things in which they think living together consists.

The friendship of base people, then, turns out to be depraved; for, being unstable, they share in things that are base, and become depraved too by becoming like each other. The friendship of decent people, by contrast, is decent and increases with their social interaction. And they even seem to become better by being active and correcting each other; for they take on the imprint of those things in each other that they find pleasing—hence the saying, "From noble people noble things."[193]

So much, then, for friendship. The next thing we should discuss is pleasure.

BOOK 10

10.1
How to Discuss Pleasure

After these issues, the next thing to discuss, presumably, is pleasure. For it seems to be most intimately related to our kind, which is why people educate the young by steering them by pleasure and pain. And it seems too that with regard to virtue of character the most important thing is enjoying what one should and hating what one should. For [pleasure and pain] extend throughout the whole of a person's life and

193. Theognis, ln. 35 Diehl. The entire phrase is "From noble people you will learn noble things."

have a powerful influence with regard to both virtue and the happy life; for people deliberately choose pleasant things and avoid painful ones.

And it would seem that one must least of all neglect these sorts of issues, especially as they involve much dispute. For some say that pleasure is the good, while others, on the contrary, say that it is altogether bad—some presumably because they are convinced that this is how things actually are, others because they think it is better as regards our life to represent pleasure as a bad thing even if it is not; for ordinary people, they think, incline toward it and are slaves to pleasures, which is why one should lead them in the contrary direction; for in that way they would arrive at the mean.

But surely this is not the correct thing to say. For accounts of matters that lie in the sphere of actions and feelings carry less conviction than the facts. When, then, they clash with what is in accord with perception, they are despised and undermine the truth as well; for if someone who censures pleasure is seen at some time or other to be aiming at it, he is thought to be inclining toward it, as if, to him, every sort of pleasure was to be sought; for it is not characteristic of ordinary people to make distinctions.

It is true accounts, then, that seem to be most useful, not only with regard to knowledge but also with regard to our life; for since they are in tune with the facts, they carry conviction, which is why they encourage those who comprehend them to live in accord with them.

Enough, then, of such issues. Let us move on to the things that have been said about pleasure.

10.2
Disputes about Pleasure

Eudoxus thought that pleasure is the good, because he saw all things, both rational and non-rational, aiming at it, and that in all cases what is choiceworthy is what is decent, and that what is most so is what is most excellent. And[194] the fact that all are drawn toward the same thing indicated, he thought, that this is the best good for all of them (for each finds its own good as it finds its own nourishment) and that what is good for all of them and what all of them seek is the good. But his accounts carried conviction more because of his virtuous character than because of the accounts themselves; for he seemed to be exceedingly temperate. It was not, then, as a friend of pleasure that he seemed to say what he said but because things were truly that way.

And he thought that the matter was no less evident from the contrary (for pain is for all things something intrinsically to be avoided, so that, similarly, its contrary is choiceworthy); that what is most choiceworthy is what we choose neither because of something else nor for the sake of something else; and that pleasure is agreed to

194. Reading δὲ.

be a thing of this sort (for nobody asks what one is pleased for the sake of—the supposition being that pleasure is intrinsically choiceworthy).

Moreover, he argued that when pleasure is added to any other good (for example, acting justly or being temperate) it makes it more choiceworthy and that the good is only increased by the addition of itself. It would seem that this argument, at least, represents pleasure as a good, and no more a good than any other; for every good is more choiceworthy when it is together with another good than when it is on its own. It is by an argument of this sort indeed that Plato[195] does away with the view that pleasure is the good; for he argues that the pleasant life is more choiceworthy with the addition of wisdom than without it, and that if the mixture is more excellent, pleasure is not the good; for there is nothing which, when added to the good, makes it more choiceworthy. And clearly nothing else would be the good either, if it becomes more choiceworthy by being together with any one of the intrinsic goods.

What, then, is there that is like this and that we share in? For this is the sort of thing we are seeking.

As for those who object [to Eudoxus' argument] by saying that what all seek is not good, surely there is nothing in what they say. For things that seem to be so to everyone, these, we say, are so. And the person who does away with this conviction [about the good] will scarcely say anything that is more convincing. For if it is those without understanding that desire these things, there would be something in what was said, but if practically wise ones do so as well, how could there be anything in what they say? But perhaps even in base ones there is some naturally good element, more excellent than themselves, which seeks the good that properly belongs to them.

It does not seem that the point about the contrary is correctly put either. For they say that if pain is bad, it does not follow that pleasure is good; for bad is also opposed to bad, and both bad and good to what is neither.[196] In saying this, they are not wrong, but in the case of the things at issue, at least, they are not speaking the truth either. For if both pleasure and pain were bad,[197] both would have to be avoided, and if both were neither good nor bad, neither would have to be avoided or both equally. But as things stand, people manifestly avoid pain as a bad thing and choose pleasure as a good one. This, then, must be the way they are opposed.

10.3
Pleasure Is a Good, Not the Good

Again, neither does it follow that if pleasure is not a quality, it is not a good either; for virtuous activities are not qualities either, nor is happiness.

195. *Philebus* 60d–e.
196. Reading μηδέτερα.
197. Reading ὄντων κακῶν.

But they say[198] that the good is determinate, while pleasure is indeterminate because it admits of more and less. If it is on the basis of people's being pleased that they judge this, the same will apply to justice and the other virtues, where we plainly say that people have more or less of these qualities and act more or less in accord with the virtues (for people can be more or less just or courageous, and act more or less justly or temperately). If, on the other hand, they judge it on the basis of the various pleasures, surely they are not stating the real cause, if indeed some pleasures are unmixed, others mixed.[199]

Again, what would prevent us from saying that just as health, while it is determinate, admits of the more and less, so too does pleasure? For the same proportion does not exist in everyone, nor is there always some single proportion in the same person, but it may be loosened and yet remain present up to a point, and so differ in the more and less. It is possible, then, for the same sort of thing also to hold concerning pleasure.

Again, by regarding the good as complete, but movements and comings to be as incomplete, they try to represent pleasure as a movement and a coming to be.[200] But they do not seem to be correct even in saying that it is a movement. For fastness and slowness seem to properly belong to every movement—if not in relation to itself (as, for example, in the case of the cosmos), then in relation to something else. To pleasure, by contrast, neither of these belongs. For while we can *become* pleased quickly, as we can become angry quickly, we cannot *be* pleased quickly, not even in relation to something else, while we can walk quickly, grow quickly, and the like. While, then, it is possible to change quickly (or slowly) to the state of pleasure, it is not possible to be active in relation to this state—I mean, to be pleased—quickly.

Again, how could pleasure be a coming to be? For it seems that one random thing does not come to be from another random thing, but rather what a thing comes to be from is what it is dissolved into, and so what pleasure is the coming to be of, pain would be the passing away of. They also say,[201] though, that pain is the need of what is in accord with nature, and pleasure its replenishment. And these feelings are bodily. If, then, pleasure is replenishment of what is in accord with nature, that in which the replenishment is found would also be what is being pleased; therefore, it is the body. But it does not seem to be. Therefore, the replenishment is not pleasure either, although when the replenishing takes place, a person would be pleased, and, when being cut,[202] pained.

This belief seems to have arisen from pains and pleasures connected with nourishment; for when people have developed a need, and so an antecedent feeling of pain, they are pleased by the replenishment. But this does not happen with all pleasures; for

198. Plato, *Philebus* 24e–25a, 31a.
199. Plato, *Philebus* 52b–d.
200. Plato, *Philebus* 53c–54d.
201. Plato, *Philebus* 31e–32b, 42c–d.
202. Reading τεμνόμενος.

those of learning are without pain as—in the case of the pleasures of perception—are those arising through smell; and many sounds, sights, memories, and expectations are like that as well. Of what, then, will they be comings to be? For no need of anything has developed of which they are the replenishment.

To those who cite the disgraceful pleasures, one might reply that these are not pleasant either (for if they are pleasant to those in a bad condition, one must not think that they are also pleasant, except to these people, just as one mustn't think either that things healthy, sweet, or bitter to sick people are such, or again that things are white which appear so to people with an eye disease).

Or else one might say that pleasures are choiceworthy but not from these sources, just as wealth is choiceworthy but not from treachery, and health but not from eating anything and everything.

Or that pleasures differ in form; for those from noble sources are different from those from shameful ones, and we cannot feel the pleasures of a just person without being just; or those of a musician without being a musician; and similarly in the other cases.

And that a friend is different from a flatterer seems to make it clear that pleasure is not a good or else that pleasures differ in form; for it is with a view to the good that the former seems to engage in social interaction with us, while the latter does so with a view to pleasure. Also, the latter is reproached, while people praise the former because he engages in social interaction with us with a view to different things.

Also, no one would choose to live having a child's level of thought throughout his life, even if he were to take the fullest possible pleasure in the things children take pleasure in, or to get enjoyment from doing some utterly shameful action, even if he were never going to suffer any pain for it. Moreover, there are many things we would consider excellent even if they brought no pleasure—for example, seeing, remembering, knowing, and possessing the virtues. But if pleasures necessarily accompany these, that makes no difference; for we would choose them even if no pleasure did come from them.

It seems clear, then, both that pleasure is not the good and that not every pleasure is choiceworthy, and that some pleasures, differing from the others in form or in their sources, are intrinsically choiceworthy.

Enough, then, for the things said about pleasure and pain.

10.4
Pleasure as Unimpeded Activity

What pleasure is or what sort of thing it is would become more evident if we take up the question again from the start. In fact, seeing seems to be complete at any time; for it does not need anything whose coming to be later will complete its form; and pleasure too seems to be like this. For it is a sort of whole, and there is no length of

time for which someone might take a pleasure the form of which would be completed if the pleasure were to last longer.

That is why pleasure is not a movement either. For every movement is in time, relates to some end, as does the craft of house-building, and will have its form completed once it produces what it seeks to produce—that is, in this whole time.

And all movements are incomplete in their parts (and during the corresponding time), which are distinct in form both from the whole movement and from each other. For putting together the stones is different from fluting the column, and both of these are different from producing the temple. Also, while the production of the temple is a complete production (for it needs nothing as regards what was proposed), the production of the foundation and of the triglyph are incomplete; for each is the production of a part. They differ in form, then, and it is not possible during any part of the time to find a movement that is complete as regards the movement's form, but if indeed such a movement is to be found, it is in the whole time.

And similarly in the case of walking and the rest. For if spatial movement is a moving from one place to another, of this too there are differences in form—flying, walking, leaping, and so on. And not only that, but there are differences even within walking itself; for the from-where and to-where are not the same in a whole stadium racecourse as they are in a part of it, or the same in one part as in another; nor is traversing this line the same as traversing that one; for we do not travel only along a line but also along one that is in a certain place, and this line is in a different place from that line.

Movement has been discussed in an exact way in other places,[203] and it does seem that it is not complete at every time, but that its many [sub-]movements are incomplete and different in form, if indeed the from-where and to-where constitute their form. But the form of pleasure is complete at every time whatsoever. It is clear, then, that pleasure and movement are different from each other and that pleasure is something whole and complete.

This would also seem to follow from the fact that it is not possible to be in movement and not take time, but it is possible to be pleased; for what occurs in the now is a sort of whole.

From these considerations it is also clear that those who say that there is a movement or a coming to be of pleasure[204] are not correct. For these are not said of everything but only of things that are divisible into parts and are not wholes; for there is no coming to be of seeing, or of a point, or of a unit, nor is there any movement or a coming to be of these at all. Of pleasure too, then, there is neither of these; for it is a sort of whole.

But since every perceptual modality is active in relation to its perceptible object, and is completely active when it is in good condition in relation to the noblest of its

203. *Ph.* 6–8.
204. Reading τῆς ἡδονῆς.

perceptible objects (for a complete activity seems to be most of all something of this sort; but whether it is the perceptual modality itself that is said to be active, or what it is in, is to make no difference), in the case of each perceptual modality, the best activity will be, then, the activity of the one that is in the best condition in relation to the most excellent of its objects; and this activity would be the most complete and most pleasant. For with every perceptual modality there is a pleasure connected, and the same holds for both thought and contemplation. But the most pleasant is the most complete, and the most complete is the activity of a subject that is in good condition in relation to the most excellent of its objects. And pleasure is what completes the activity. But pleasure does not complete it in the way that the perceptible object and the perceptual modality do when they are both excellent, just as health and a doctor are not in the same way a cause of being healthy.

(That pleasure arises in connection with each of the perceptual modalities is clear; for we say that sights and sounds are pleasant. And it is clear too that it does so most when the perceptual modality is at its best and is active in relation to an object that is in the same condition. And when the perceptual modality and the object being perceived are in a condition like that, there will always be pleasure—so long, at any rate, as what will produce the effect and what will be affected are both present.)

And pleasure completes an activity not as the state does by being present in something, but as a sort of supervenient end, like the bloom on those in their prime. So long, then, as the intelligible object or the perceptible one is as it should be, and what judges or contemplates is too, there will be pleasure in the activity; for when the affected and the affecter are similar and keep in the same relation to each other, the same thing naturally arises.

How is it, then, that no one is pleased continuously? Or is it that one gets tired? For continuous activity is impossible for all things human. No continuous pleasure, then, arises either; for it follows along with the activity. Some things delight us when they are novelties, but later delight us less, because of the same thing; for at first thought is called forth and is intensely active regarding them, as happens in the case of our sight when we look hard at something, but later the activity is no longer like that but has relaxed, which is why the pleasure too is dimmed.

Pleasure's being desired by everyone, one might think, is due to the fact that everyone also aims at living. And living is a sort of activity, and each person is active in relation to those things and with those things that he likes most—for example, a musician is active with his hearing in relation to melodies, and a lover of learning is so with his thought in relation to objects of contemplation, and so on for each of the others. And pleasure completes the activities and hence it completes living, which is what people find desirable. It is reasonable, then, that they aim at pleasure too; for, for each person, it completes living, and living is something choiceworthy.

But whether we choose living because of pleasure, or pleasure because of living—this is something we may set aside for the present. For the two appear to be coupled

together and not to admit of separation; for without activity pleasure does not arise, and every activity too is completed by pleasure.

10.5
Different Forms of Pleasure

That is why pleasures seem also to differ in form. For we think that things that are distinct in form are completed by distinct things (for this is apparently what happens both with natural things and with the products of craft—for example, animals, trees, a painting, a sculpture, a house, or a vessel) and, similarly, that activities that differ in form are completed by things that differ in form.

Activities of thought, however, differ in form from those of the perceptual modalities, and both differ in form among themselves. So too, then, do the pleasures that complete them. This would be evident also from the fact that each of the pleasures is intimately related to the activity it completes. For the pleasure that properly belongs to it assists in increasing the activity. For it is those engaging in the activity with pleasure who judge each thing better and treat it with greater exactness; for example, those who enjoy geometry become true geometers and understand each aspect of it better and, similarly, those who are lovers of music or building or whatever it is—each makes advances in their own work by finding enjoyment in it. And so the pleasures assist in increasing the activities. But what assists in increasing something properly belongs to that thing, and to things that are distinct in form, things that are also distinct in form properly belong.

This would be even more evident, however, from the fact that activities are impeded by pleasures arising from other sources. For lovers of pipe music are incapable of paying attention to a discussion if they happen to overhear someone playing the pipe, because they enjoy pipe playing more than the activity at hand. The pleasure connected with pipe playing, then, destroys the activity related to discussion.

This also happens in a similar way in other cases, when we are involved in two activities at the same time; for the more pleasant activity knocks out the other one, and all the more so if the difference in pleasure is large, so that we are not even active in the other. That is why when we enjoy something intensely, we scarcely do anything else, but do indeed do other things when only mildly pleased—for example, people who eat sweets in theaters do so most when the actors are bad.

And since the pleasure that properly belongs to an activity makes it more exact, longer lasting, and better, while alien pleasures spoil it, clearly they vary widely. For alien pleasures do pretty much precisely what proper pains do; for the pains that properly belong to activities destroy them—for example, if painting or rationally calculating is unpleasant and painful for someone, he does not write or rationally calculate, because the activity is painful. An activity is affected in contrary ways, then, by the pleasures and pains that properly belong to it—the ones that properly belong

being the ones that supervene on the activity intrinsically. As for the alien pleasures, we said that they have much the same effect as pain; for they destroy the activity, only not in the same way.

Since activities differ in decency and baseness, however, and some are choiceworthy, some to be avoided, and some neither, the same goes for pleasures as well; for each activity has a pleasure that properly belongs to it. The pleasure, then, that properly belongs to an excellent activity is decent, and the one that properly belongs to a base activity is depraved; for appetites too are praiseworthy when they are for noble activities, and blameworthy when for shameful ones. And the pleasures that are in the activities more properly belong to these than do the corresponding desires; for the desires are distinguished from the activities both in time and in nature, while the pleasures are closely related to the activities and so little distinguished from them that disputes arise as to whether the activity and the pleasure are the same thing. Still, pleasure does not seem to be thought or perception (for that would be strange), but because it is not found separated, it appears to some people to be the same as them.

Just as activities are distinct, then, so too are the corresponding pleasures. Sight differs from touch in purity, however, as hearing and smell do from taste. The pleasures, then, also differ in the same way, as the pleasures of thought do from these, and as, within each of the two, some do from others.

And each sort of animal seems to have a pleasure that properly belongs to it, just as it has a work; I mean the pleasure that is in accord with its activity. This would also become evident if we look at each: for horse, dog, and human being have different pleasures, and, as Heraclitus says, "Donkeys prefer sweepings to gold";[205] for food is more pleasant to donkeys than gold. While the pleasures, then, of those that are distinct in form also differ in form, it would make perfect sense for those of the same form not to differ. But in the case of human beings, at any rate, they do differ in no small way; for the same things delight some people and give pain to others, and while to some they are painful and hateful, to others they are pleasant and lovable. This also happens in the case of sweet things; for the same things do not seem sweet to the feverish person and to the healthy one, or hot to the weak person and to the one in good physical condition. And the same thing happens in other cases.

In all such cases, however, it seems that what is so is what appears so to an excellent person. And if this is correct, as it seems to be, and it is virtue and a good person (insofar as he is such) that are the measure of each thing, then pleasures would be those that appear to be pleasures to him, and the things that are pleasant would be the ones that he enjoys. But if the things he finds repellant seem pleasant to someone else, it is no wonder; for there are many ways for human beings to get destroyed or spoiled. Pleasant, however, these things are not, except to these people and to people in this condition. It is clear, then, that pleasures agreed to be shameful must be said not to be pleasures at all, except to people who have been destroyed.

205. B9 DK.

Among those pleasures that seem to be decent, however, which sort or which particular one must we say is characteristic of the human being? Or is this clear from the activities? For the pleasures follow along with these. So, whether the activities of the complete and blessed man are one or more than one, the pleasures that complete these would be said to be characteristically human pleasures in the strict sense, while the rest would be so in a secondary or many-times-removed way, as would the activities.

10.6
Happiness Reconsidered

Now that we have discussed matters concerning the virtues, friendships, and pleasures, it remains for us to go through happiness in outline, since we take it to be the end of human affairs. If we first recapitulate what was said previously about this, then, our account would be more concise.

We said[206] that happiness is not a state; for if it were, even someone who was asleep his whole life, living the life of plants, might possess it, or someone suffering the greatest strokes of bad luck. If, then, this is not satisfying, one must class happiness
1176[b]1 as a sort of activity, as was said previously.[207] And if some activities are necessary and choiceworthy because of other things, while others are intrinsically choiceworthy, it is clear that happiness must be classed as one of those that are intrinsically choiceworthy, not as one of those choiceworthy because of something else; for happiness needs nothing but is self-sufficient.

The ones that are intrinsically choiceworthy, however, are those from which nothing is sought beyond the activity. And actions in accord with virtue seem to be like this; for doing noble and excellent actions is one of the things that are choiceworthy because of themselves.

Pleasant amusements also seem to be like this; for we do not choose them because of other things. In fact, people are harmed by them more than benefited, through being led to neglect their bodies and possessions. Most of those who are called "happy," however, have recourse to such pastimes, which is why those who are witty participants in them enjoy a good reputation with tyrants; for they make themselves pleasant in supplying what these aim at, and tyrants need people like that. So these amusements seem to bear the stamp of happiness, because people in positions of power spend their leisure in them. Presumably, such people are not a sign of anything; for neither virtue nor understanding, which are the sources of excellent activities, depend on holding positions of power. And if, being unable to taste pure and free pleasures, people in such positions take refuge in the bodily ones, one must not

206. 1095[b]32–1096[a]2, 1098[b]31–1099[a]7.
207. 1098[a]5–6.

think these more choiceworthy because of this; for boys too think the most excellent things are the things most honored among themselves. It is reasonable, then, that just as different things appear estimable to boys and men, so it is too for base people and decent ones.

As we have often said,[208] then, what is estimable and pleasant is what is so to the excellent person. But for each person, the activity in accord with the state that properly belongs to him is most choiceworthy, and so for the excellent person it is the one in accord with virtue.

Therefore, happiness does not lie in amusement; for it would indeed be strange if the end were amusement and we did all the work we do and suffered evils all our lives for the sake of amusing ourselves. For we choose (one might almost say) everything for the sake of something else—except happiness: for end it is. But to engage in serious matters and to labor for the sake of amusement would be manifestly silly and utterly childish. And "amusing ourselves so as to engage in serious matters," as Anacharsis puts it, seems to be correct; for amusement is like relaxation, and it is because people cannot labor continuously that they need relaxation. End, then, relaxation is not; for it occurs for the sake of activity.

The happy life seems to be in accord with virtue, and this is one that involves **1177^{a}1** engagement in serious matters and does not lie in amusement. And we say that serious things are better than ridiculous ones and those that involve amusement, and that in every case the activity of what is better, whether a part or a human being, is more excellent. But the activity of what is better is more excellent and already bears more of the stamp of happiness.

Again, any random person—even a slave—can enjoy bodily pleasures no less than the best person can. But no one assigns a share in happiness to a slave any more than a share of the relevant sort of life. For happiness does not lie in such pastimes but in activities in accord with virtue, as was also said previously.[209]

10.7
Happiness as Contemplation

But if happiness is activity in accord with virtue, it is reasonable that it should be in accord with the one that is most excellent; and this would be the virtue of the best element. Whether, then, this element is understanding or something else that seems in accord with nature to rule, lead, and understand noble things and divine ones—whether by being something divine itself or by being the most divine element in us—the activity of it, when in accord with the virtue that properly belongs to it, would be complete happiness. That it is contemplative activity we have said.[210]

208. Most recently at 1176^{a}15–22, also 1113^{a}22–33, 1166^{a}12–13, 1170^{a}14–16.
209. Most recently at 1176^{a}35–^{b}9.
210. This has not in fact been said in so many words.

And this would seem to be in agreement both with what was said previously and with the truth. For this activity is also most excellent (for not only is understanding the most excellent element in us, but also, of knowable objects, the ones that understanding is concerned with are the most excellent ones). And further, it is the most continuous activity; for we can contemplate more continuously than we can do any action whatsoever.

Moreover, we think that pleasure must be mixed in with happiness, and the most pleasant of the activities in accord with virtue is agreed to be the one in accord with theoretical wisdom. Philosophy, at any rate, seems to involve pleasures that are wondrous in their purity and stability, and it is reasonable that those who have attained knowledge pass their time more pleasantly than those who are seeking it.

Moreover, the self-sufficiency that is spoken of would belong most of all to contemplative activity; for while a theoretically wise person, a just one, and people with the other virtues all need the things necessary for living, when these are adequately supplied, the just one still needs people to do just actions for and with, and similarly for the temperate person, the courageous person, and each of the others. But the theoretically wise person, even when by himself, is able to contemplate, and the more theoretically wise he is, the more he is able to do so. It is perhaps better for him to have co-workers, but nonetheless he is most self-sufficient.

Moreover, this activity, and only this, would seem to be liked because of itself
1177b1 [alone]; for nothing arises from it beyond having contemplated, while from the practical ones we try—to a greater or lesser extent—to get for ourselves something beyond the action.

Moreover, happiness seems to reside in leisure; for we do unleisured things in order to be at leisure, and wage war in order to live in peace. The activity of the practical virtues occurs in politics or in warfare, and the actions concerned with these seem to be unleisured and those in warfare completely so (for no one chooses to wage war for the sake of waging war, or to foment war either; for someone would seem completely bloodthirsty if he made enemies of his friends in order to bring about battles and killings). But the activity of the politician too is unleisured, and beyond political activity itself he tries to get positions of power and honors or, at any rate, happiness for himself and his fellow citizens—this being different from the exercise of politics and clearly something we seek on the supposition of its being different.

If, then, among actions in accord with the virtues, those in politics and war stand out in nobility and magnitude, but these are unleisured and aim at some end rather than being choiceworthy because of themselves, while the activity of understanding seems to be superior in seriousness because it is contemplative, to aim at no end beyond itself, and to have its own proper pleasure, which assists in increasing the activity, and if in addition the self-sufficiency, leisured quality, and un-weariness (so far as this is possible for a human being), as well as all the other things assigned to the blessed, are manifestly things that properly belong to this activity, then this activity

would be the complete happiness of a human being, provided it receives a complete span of life (for nothing is incomplete that is characteristic of happiness).

But such a life would be more excellent than one in accord with the human element; for it is not insofar as he is a human being that someone will live a life like that but insofar as he has some divine element in him; and to the degree that this element is superior to the compound, to that degree will its activity also be superior to that in accord with the other sort of virtue. If, then, understanding is something divine in comparison with the human element, so also a life in accord with it is divine in comparison with human life. And one must not, in accord with the makers of proverbs, "think human things, since you are human" or "think mortal things, since you are mortal," but rather one must as far as possible immortalize, and do everything to live in accord with the element in oneself that is most excellent; for even if it is small in bulk, in its capacity and esteem it far exceeds everything. **1178^{a}1**

It would seem too that each person actually is this, if indeed it is the controlling and better element. So it would be strange if he were to choose not his own life but that of something else. Moreover, what was said previously will fit now as well; for what properly belongs to each thing by nature is most excellent and most pleasant for each of them; for each human being, then, the life in accord with understanding is so too, if indeed this most of all is a human being. Therefore, this life will also be happiest.

10.8
Two Sorts of Happiness

Happiest, but in a secondary way, is the life in accord with the other virtue; for the activities in accord with it are [merely] human. For just actions, courageous actions, and other actions that we do in accord with the virtues, we do in relation to each other in contracts, catering to needs, and in every sort of action and in feelings as well, by keeping closely to what is appropriate to each person. And all of these are manifestly human. Indeed, some of them even seem to arise from the body, and virtue of character seems in many ways to be intimately related to feelings.

Practical wisdom too is coupled together with virtue of character, and it with practical wisdom, if indeed the starting-points of practical wisdom are in accord with the virtues of character and the correctness of these virtues is in accord with practical wisdom. And connected as these virtues also are with feelings, they would be concerned with the compound. But the virtues of the compound are [merely] human. So too, then, are both the life and the happiness that is in accord with them. But the virtue of understanding is separated. (About it, in fact, let just this much be said; for to develop an exact account of it is a greater task than the one we have set before us.)

It would seem too that the virtue of understanding has little need of external supplies or less need than virtue of character does. For let us grant that they both

need the necessary ones and to an equal extent, even if the politician does labor more in relation to the body and suchlike; for any differences here would be small. But as regards the activities there will be a large difference. For the generous person will need money for doing generous actions, and so will the just one, of course, for repaying debts (for wishes are not manifest things, and people who are not just pretend to wish to do just actions). And the courageous person will need capacity,[211] if indeed he is to bring to completion anything that is in accord with his virtue. And the temperate one will need authority; for how else would it be manifest that he or any of the others is what he is?

Moreover, it is disputed whether it is deliberate choice or action that is the more controlling element in virtue, on the supposition that it depends on both. But its completeness clearly does depend on both; although for the actions many things are needed and more of them the greater and more noble the actions are.

The person who is contemplating, by contrast, needs none of these things, at any rate, for the activity. On the contrary, one might almost say that they are even impediments, at any rate, to his contemplating. But insofar as he is a human being and living with many other people, he chooses to do the actions that are in accord with virtue and so will need such things for living a human life.

But that complete happiness is a sort of contemplative activity would also be evident from the following considerations. For we suppose the gods to be the most blessed and happy of all. But what sorts of actions must we assign to them? Just ones? Won't they appear ridiculous if they engage in transactions, return deposits, and so on? Courageous ones, then, enduring what is frightening and facing danger because it is a noble thing to do? Or generous ones? To whom will they give? It will be a strange thing if they actually have money or anything like that. And their temperate actions, what would they be? Or isn't it unrefined to praise them for not having base appetites? If we were to go through them all, it would be evident that everything to do with actions is petty and unworthy of gods. Nonetheless, everyone supposes them to be living, at any rate, and therefore in activity; for surely they are not sleeping like Endymion.[212] If, then, living has doing actions taken away from it and still more so producing, what is left except contemplating? So the activity of a god, superior as it is in blessedness, would be contemplative. And the activity of humans, then, that is most akin to this would most bear the stamp of happiness.

A further sign of this is that other animals, being completely deprived of this sort of activity, do not share in happiness. For the life of the gods is blessed throughout, that of human beings is so to the extent that it has something similar to this sort of activity, but of the other animals, none has access to happiness, since they in no way share in contemplation. Happiness extends, then, just as far as contemplation does, and those to whom it more belongs to contemplate, it also more belongs to be happy,

211. Either in the shape of personal prowess or in the shape of a force of fellow soldiers.
212. Made immortal by Selene, but cast into a deep sleep.

not coincidentally, but in accord with contemplation; for this latter is intrinsically estimable. So happiness would be some sort of contemplation.

But to the extent that someone is a human being, he will also need external prosperity; for his nature is not self-sufficient for contemplation, but his body must be healthy and provided with nourishment and other sorts of service. Nonetheless, one must not think that a person who is going to be happy needs many things and grand ones, even if it is not possible for him to be blessed without external goods; for self-sufficiency does not lie in an extreme amount of these and neither does action. But it is possible to do many noble actions even without ruling land and sea; for even from moderate resources a person can do actions in accord with virtue. (This is plain enough to see; for private individuals seem to do decent actions no less, or even more, than people in positions of power.) It is enough, then, to have that amount; for the life of a person who is active in accord with virtue will be happy.

Solon too was presumably depicting happy people correctly when he described them as moderately supplied with external goods but as having done what he regarded as the noblest actions and lived their lives temperately; for it is possible for those with moderate possessions to do the things one should. Anaxagoras[213] also seems to have supposed the happy person to be neither rich nor in a position of power when he said that it would be no wonder if the happy one appeared to be a strange sort of person to ordinary people; for these judge by external goods; for these are the only ones they can perceive. The beliefs of wise people, then, would seem to be in harmony with our arguments.

But while these sorts of considerations also carry a certain persuasiveness, the truth in practical matters must be judged from the works and the life; for these are what have the controlling vote. When we examine what has been previously said, then, it must be judged by bringing it to bear on the works and the life, and if it is in harmony with them, one must accept it, but if it clashes, one must suppose it mere words.

The person whose activity is in accord with understanding, however, and who takes care of it, would seem to be both in the best condition and the one most loved by the gods. For if the gods exercise a sort of supervision over human affairs, as indeed they seem to, it would also be reasonable both that they should enjoy what is best and most akin to themselves (and this would be the understanding) and that they should reward those who most like and honor it for taking care of what they themselves love and for acting correctly and nobly. But that all these qualities belong most of all to the wise person is not unclear. Therefore, he is most loved by the gods. And the same person is also likely to be the happiest. So in this way too the wise person would be most happy of all.

213. *EE* $1215^{b}6$–14, $1216^{a}11$–16.

10.9
Politics, Legislators, and Happiness

Well then, if we have said enough in outline about these issues and about the virtues, and further about friendship and pleasure, must one think that our deliberate choice has achieved its end? Or is it, as the saying goes, that in the case of practical matters the end is not to contemplate and know each of the various things but to put these into action? To know about virtue is not enough either, then, but we must try to have and use it or to become good in whatever other way we can?

If arguments were self-sufficient for making people decent, "many and large the wages they would earn," as Theognis says,[214] and justly so, and arguments would be what need to be provided. As things stand, however, they appear to have the strength to encourage and stimulate those of the young who are free-minded, and to make ready to be possessed by virtue a character that is well-bred and that truly loves the noble, but to be unable to encourage ordinary people toward noble-goodness; for ordinary people naturally obey not shame but fear and abstain from base things not because of their shamefulness but because of the sanctions involved; for living by feeling as they do, they pursue the pleasures that are properly their own as well as the things through which these come about, and avoid the opposing pains. Of the noble and the truly pleasant, however, they have no understanding at all, not having tasted it.

What sort of argument, then, could reform such people? For it is not possible—or not easy—to alter by argument what has long since been locked up in traits of character. Presumably, we must be content if, when we have all the things through which it seems we become decent people, we achieve some share of virtue.

Some people think that it is by nature that we become good, while some think that it is by habit and others by teaching. Nature's contribution is clearly not up to us, but because of some divine causes is present in those who are truly lucky. Argument and teaching, on the other hand, surely do not have strength in everyone, but rather the soul of the listener must be prepared beforehand through habits to enjoy and hate in a noble way, like earth that is to nourish seed. For the one who lives in accord with his feelings would not listen to—or, what is more, comprehend—any argument that encourages him to turn away. And in a state like that how is it possible to persuade him to change his ways? Moreover, feeling generally seems to yield not to argument but to force. Character, then, must in some way be there beforehand and properly suited for virtue, liking the noble and repelled by the shameful.

It is difficult, however, for someone to get correct guidance toward virtue from childhood if he has not been nurtured under laws of the appropriate sort; for a moderate and resilient way of living is not pleasant for ordinary people, most of all when

214. Lns. 432–434 Diehl.

they are young. That is why laws must prescribe their nurture and practices; for these will not be painful when they have become habitual.

But it is not enough, presumably, that when people are young they get the correct nurture and supervision. On the contrary, even when they have grown into adulthood they must continue to practice the same things and be habituated to them, and so there would need to be laws concerning these matters as well and, in general, then, concerning all of life; for ordinary people obey force rather than argument and penalties rather than the noble. **1180ᵃ1**

That is why some think[215] that legislators should, on the one hand, exhort and encourage people toward virtue for the sake of the noble (on the supposition that those who have been decently guided in the formation of habits will listen), and, on the other hand, impose punishments and sanctions on those who disobey and are not naturally well-disposed, while entirely expelling those who are incurable;[216] for the decent person, they think, living as he does with a view to the noble, will obey reason, while a base one, whose desire is for pleasure, needs to be punished by means of pain, like a beast of burden. That too is why they say that the sorts of pains inflicted should be such as are most opposed to the pleasures liked.

Whatever about that; if, as we said, the one who is to be good should be nobly nurtured and habituated and then live that way in decent practices and neither involuntarily nor voluntarily do base actions, this would happen if people lived their life in accord with a sort of understanding and correct constitutional order and this had the requisite strength.

Paternal instructions do not have such strength or the element of compulsion and neither, then, do the instructions of any individual man in general (unless he is a king or something like that). The law, however, does have the capacity to compel, being word that derives from a sort of practical wisdom and understanding. And while people feel enmity toward human beings who oppose their impulses, even if they do so correctly, the law causes no offense in prescribing what is decent.

Yet it is in the city of the Spartans alone (or almost alone) that the legislator[217] seems to have created the supervision of nurture and also of practices. In most cities, however, such matters are utterly unsupervised, and each person lives as he wishes, Cyclops-fashion, laying down the law "for children and wife."[218]

The most excellent thing, then, is that there should be communal supervision that is correct. But if things are communally unsupervised, it would seem appropriate for each individual to further the virtue of his own children and friends—to be capable of doing it,[219] or, at any rate, of deliberately choosing it. But he would be more capable of doing this, it seems, given what has been said, if he becomes competent

215. Plato, *Laws* 718c–723d.
216. Plato, *Protagoras* 325a–b.
217. Lycurgus, *Pol.* 2.9.
218. Homer, *Odyssey* 9.114–115.
219. Transposing καὶ δρᾶν αὐτὸ δύνασθαι from 1180ᵃ30.

in legislative science. For it is clear that communal sorts of supervision come about through laws and that decent ones do so through excellent laws. Whether the laws are written or unwritten would seem to make no difference, nor would it make a difference whether one or many are thereby educated—any more than it does in the case of music, physical training, or any of the other practices. For just as lawful things and habits[220] have strength in cities, so in households do paternal words and habits (still more strength, in fact, because of the kinship and the benefactions involved; for children are by nature predisposed to feel affection and be ready to obey).

Further, particularized education is actually superior to communal education, just as in the case of medicine; for while rest and abstinence from food are in universal terms advantageous for a feverish patient, for a particular patient, presumably, they may not be, nor does a boxing instructor prescribe the same style of fighting for everyone. It would seem, then, that a particular case is treated with more exactness when there is individual supervision; for each person is more likely to get what suits him. But the best supervision in each particular case will be provided by the doctor, athletic trainer, or whoever else has knowledge of the universal and knows what applies in all cases or in these sorts (for the sciences are said to be—and actually are—of what is common).

But, despite that, there is nothing to prevent a single individual from being correctly supervised even by someone without scientific knowledge but who has—due to experience—seen exactly what happens in each particular case, just as some people seem to be their own best doctors even though they would be of no assistance at all to another person. Nonetheless, it seems, presumably, that the one who does wish to become expert in a craft or in a theoretical science must take steps toward the universal and come to know it as well as possible; for that, we said, is what the sciences are concerned with.

Maybe, then, the one who wishes to make people—whether many or few—better because of his supervision must also try to acquire legislative science, if it is through laws that we can become good. For producing a noble disposition in anyone whatsoever—in anyone put before him—is not a matter for some random person, but if indeed anyone can do it, it is the person who has knowledge, just as in medicine and in all other matters that involve a sort of supervision and practical wisdom.

Mustn't we next investigate, then, from what sources and in what way someone might become competent in legislative science? Or isn't it, as in other cases, from politicians? For, as we saw,[221] legislative science seems to be a part of politics. Or isn't it evident that it is the same in the case of politics as in the other sciences and the other capacities? For in the others, it is evident that it is the same people who impart their capacities to others as actively practice them themselves, just as with doctors or writers. In the case of politics, however, although it is the sophists who profess to

220. Reading ἔθη twice.
221. 1141b24–25.

teach it, it is practiced not by any of them but by politicians, and they seem to do so thanks to some sort of capacity and to experience rather than to thought; for it is evident that they neither write nor speak about such matters (and yet that would be a nobler thing, presumably, than to compose speeches for the law courts and the assembly), and further, it is evident that they have not made their own sons or any other friends of theirs into politicians either. But it would be reasonable for them to have done so, if indeed they were able to; for there is nothing better than this capacity that they could have left to their cities or could have chosen to have for themselves or, then, for their closest friends. Still, experience does seem to make no small contribution; for otherwise people could not, through intimacy with politics, have become politicians. That is why those who aim to know about politics would seem to need experience in addition.

Those of the sophists who profess to teach politics, however, are manifestly a long way from teaching it; for on the whole they know nothing about what sort of thing it is or what sorts of things it is concerned with; for if they did, they would not have taken it to be the same as rhetoric or even inferior to it, nor would they have thought that legislating is an easy matter for anyone who has collected together laws that enjoy a good reputation; for it amounts to selecting the best ones—as if the selection did not call for comprehension and correct judgment were not, as in matters of music, the greatest thing. For those with experience in a particular area judge the works in it correctly and comprehend by what means or in what way they are brought to completion, and judge what is in tune with what, while those without experience must be content not to have it escape them whether the work is well or badly made, as in the case of painting. But laws would seem to be the works of politics, so how, on the basis of them, could someone become competent in legislative science or judge which laws are best them? For it is evident that we do not become doctors from reading textbooks either.

And yet these textbooks do try to say not only what the treatments are but also how each sort of patient might be cured and should be treated, distinguishing their various states. But while these do seem to be of benefit to experienced people, to those without scientific knowledge they seem useless. Presumably, then, collections of laws and constitutions might also be of good use to people who are able to get a theoretical grasp on them and judge what is correctly done or the opposite and what sorts of things fit with what. In those who go through them without being in this state, however, no correct judgment would be present, unless of course by chance, although they may become better comprehenders of them.

So, since our predecessors have left the subject of legislation unexamined, it is presumably better if we ourselves investigate it and indeed constitutions generally, so that as far as possible our philosophy of human affairs may be brought to completion.

First, then, if there is anything that has been correctly said by our predecessors on some part of the subject, let us try to go through it and then, on the basis of the

collection of constitutions,[222] try to get a theoretical grasp on what sorts of things preserve and destroy cities, what sorts of things preserve or destroy each sort of constitution, and what causes some cities to be well governed and others the opposite. For when we have a theoretical grasp on these matters, maybe we will also be better able to see what sort of constitution is best, how each sort is arranged, and what laws and habits it uses.

Let us discuss this, then, starting from the beginning.

222. The 158 constitutions compiled under Aristotle's supervision, of which only the *Athenian Constitution* survives complete.

†MAGNA MORALIA*

The Great Ethics

BOOK 1

1.1
Ethics, Virtue, and the Good

1. Since we are deliberately choosing to speak about characters, we must first investigate what character is a part of. Speaking concisely, then, it would seem to be a 1181ª25
part of nothing other than politics. For one cannot do any action in politics without being of a certain sort—I mean, the sort an excellent person is. And to be excellent is to have the virtues. **2.** Therefore, if one is going to be a doer of actions in political matters, one must be excellent in one's character. **3.** Therefore, a study concerned 1181ᵇ25
with characters is a part, as it seems, and a starting-point of politics. And as a whole, it seems to me, the study would rightly be titled not "ethics" but rather "politics."

4. Therefore, we must, as it seems, first speak about virtue, what it is and from **1182ª1**
what it comes about. For presumably there is no profit in knowing virtue without knowing how it will come about and from what. For we must investigate it not only in order to acquire knowledge of what virtue is, but also investigate from what it will arise. For we at the same time wish to know [virtue] and also to be of the virtuous sort 5
ourselves, and we will not be able to be this, if we do not know both from what, and in what way, it will come about. It is necessary, then, to know what virtue is. **5.** For it is not easy to know from what, and in what way, it will come about, without knowing its what-it-is, just as in the case of the sciences. We must not fail to consider, either, anything said by those who have previously spoken about these issues. 10

6. It was Pythagoras, then, who first attempted to speak about virtue, although not in the correct way; for by reducing virtues to numbers, he produced a theoretical investigation that did not properly belong to the virtues; for justice is not a number that is an equal times an equal.[1]

7. Socrates, coming after him, spoke better and more fully about these, although 15
even he did not do so correctly. For he made the virtues sciences;[2] but it is impossible

---

* Translated by C. D. C. Reeve. Text: F. Susemihl, *Aristotelis Quae Ferentur Magna Moralia* (Leipzig, 1883), in consultation with H. M. Johnstone, *Prolegomena to a Critical Edition of the Aristotelian Magna Moralia* (DPhil. diss., Oxford, 1997). The title of the treatise may derive simply from the length of the two papyrus rolls containing its component books.

1. I.e., a number that is N × N, or square. See *Met*. 985ᵇ29.

2. *NE* 1144ᵇ28–30.

for them to be this. For the sciences all involve reason, and reason appears in the part of the soul involving thought. All the virtues, then, according to him, appear in the rationally calculative part of the soul. The result is that by making all the virtues sciences he does away with the non-rational part of the soul, and by doing this he also does away with feeling and character. That is why he did not in this respect grasp the virtues correctly.

8. After this Plato correctly divided the soul into the part having reason and the non-rational one, and assigned to each the virtues that properly belong to it.[3] Up to this point, then, he did well. After this, however, he was no longer correct. For he mixed and coupled virtue into his study of the [Form of the] good,[4] which is *not* correct; for it does not properly belong there; for in speaking about the beings and truth, he should not have been speaking about virtue; for there is nothing common to the former and the latter.[5]

9. These people, then, touched on the subject to this extent and in this way. The next thing to be investigated is what we ourselves must say about these. First, then, we must see that every science and capacity has some end, and this end is something good. For no science or capacity exists for the sake of something bad. **10.** If, then, the end of all capacities is something good, it is clear that that of the best one would be **1182b1** best. But politics is the best capacity, so that its end would be a good. Therefore, it is about a good that it seems we must speak; and not about the unconditional good, but about the good for us. For the good of the gods is not for us to speak about, but rather that belongs both to another account and to an investigation alien to our purpose.

11. Therefore, it is the political good that we must speak about. But this in turn we must divide. About the good said in what way? For the good is not simple. For we call "good" either the best in the case of each of the beings (and this is what is choiceworthy because of its own nature) or what other things are good by participating in, and this is the Form of the good. **12.** Must we speak about the Form of the good, then, or not about it, but rather about the common good that is present in all things? For this would seem to be distinct from the Form. For the Form is intrinsically separate, while the common good is present in all things; it is not, then, the same as the separate one. For what is separate naturally and intrinsically could never be present in all things.

13. Are we, then, to speak about this one, the good that is present in all things? Or rather, not? Why? Because this one is what is common, like the definition and the [result of the] induction. The definition means to state the substance of the given thing, whether what good is, or what bad is, or what something else is. The definition states that the such-and-such is universally good—the thing, whatever it is, that is choiceworthy because of itself; while the good present in all things tallies with this

3. *Republic* 436a–444a, 518d–519a.
4. I.e., the *Republic*, especially 585b–588a.
5. The former being a matter for a theoretical science, the latter for a practical one.

definition. And the definition says what good is. **14.** But no science or capacity says about its own end that it is good; rather, this is for another capacity to get a theoretical grasp on. For neither the doctor nor the builder says either that health or a house is good; rather, the one states that he produces health, the other a house, and in what way he produces it. **15.** Therefore, it is clear that it is not for politics either to speak about the good that is common. For it too is a science among the rest, and, as we saw, it belongs to no science or capacity to state that its end is this. Therefore, it is also not for politics to speak about the common good that is in accord with the definition.

16. Nor again about the one that is common in accord with induction. Why? Because when we wish to prove that something is among the particular goods, either we prove by means of the definition that the same account fits both the good and this thing that we wish to prove is good, or else by means of induction. For example, if we wish to prove that greatness of soul is good, we say that justice is good, and courage, and the virtues generally; but greatness of soul is a virtue; so greatness of soul too is **1183^{a}1** good. **17.** Nor, then, must politics speak about the good that is common in accord with induction, because the same impossible things will result for it as for the good that is in accord with the definition. For here too it will say that [the end] is good.

It is clear, then, that what politics must speak about is the best good, and by the best one [I mean] the best one for us. **18.** And, in general, one can see that it belongs to no single science or capacity to investigate every good. Why? Because the good is present in every category. For it is present in the what[-it-is], in quality, in quantity, time, relative, and in all of them generally. **19.** But in medicine it is the doctor who knows the good in time, in navigation the captain, and in each one the given person. For the doctor knows the time one must cut and the captain the time one must sail. And in each science the given person will know the time that is good in it. For the doctor will not know the time that is good in navigation, nor the captain the one in medicine. Therefore, it must not speak in this way even about the good that is common. For the one in time is common[6] to all of these sciences. **20.** Similarly, the relative good and the one that corresponds to the other categories are also common to all of them, and it does not belong to any capacity or science to speak of what is good[7] in all sciences, nor, again, does it belong to politics to speak about the good common [to them]. [It belongs to it to speak,] therefore, about the good, about the best one, and about the best one for us.

21. Nor, presumably, when one wishes to prove something, must one use paradigms that are not evident, but rather evident ones in place of non-evident ones, and perceptible ones in place of intelligible ones. For these are most evident. When, then, one undertakes to speak about the good, one must not speak about the Form. **22.** And yet they,[8] at any rate, think that, whenever they speak about the good, they

6. Omitting ἐν.
7. Omitting πότε.
8. Platonists.

must speak about the Form. For they say that they must speak about what is most of all good; but each F-itself is what is most of all F; so the Form, they think, would be most of all good. **23.** An argument of this sort is perhaps true, but the science or capacity of politics, which the present account is about, does not investigate this good, but rather the good for us. For no science or capacity says of its end that it is good, so that politics does not do so either. That is why the account it produces is not about the good that is in accord with the Form.

24. "But perhaps," [an objector] says, "using this good as a starting-point, I will, advancing from it, speak about the particular goods." But even this is not correct. For one must take starting-points that properly belong to them. For it is absurd, if one wishes to prove that the triangle contains two right angles, to take as starting-point that the soul is immortal. **25.** For it does not properly belong [to the triangle], while the starting-point must properly belong and be followed from it. But as things stand, even without the soul's being immortal, one will be able to prove that the triangle contains two right angles. **26.** Similarly, in the case of goods too, it is possible to get a theoretical grasp on the others without the one that is good in accord with the Form [of the good].[9] {Nor was Socrates correct when he made the virtues sciences. For he thought that nothing should be pointless, but from the virtues being sciences it follows that, for him, the virtues are pointless. Why? Because in the case of the sciences it follows that one simultaneously knows what the science is and is possessed of scientific knowledge. **27.** For if someone knows what medicine is, he is immediately a doctor, and it is the same way too in the case of the other sciences. But this does not follow in the case of the virtues. For it is not the case that if someone knows what justice is, he is immediately just, and the same way with the others. It follows, then, that the virtues are pointless, and are not sciences.}[10]

1.2
Divisions of Goods

1. Since these things have been determined, let us try to say in how many ways things are said to be good. For among goods, some are estimable, others praiseworthy, others capacities. By "estimable" I mean things of the following sort: the divine, the better (for example, soul, understanding), the more ancient, the starting-point, and things of this sort. For those things are estimable on which honor is based, and honor follows along with all such things. Virtue, then, is also something estimable—certainly, at any rate, when someone has become excellent due to it; for at that point he already has the shape of virtue. **2.** Praiseworthy things are, for example, the virtues. For it is from actions done in accord with these that praise comes about. Capacities are, for

9. Omitting διὸ . . . τἀγαθοῦ ("which is why [he thinks that] the starting-point consisting of this good is not appropriate").
10. This passage seems out of place.

example, ruling office, wealth, strength, beauty. For these are things that the excellent person has the capacity to use well, the base person badly. That is why such goods are called "capacities." **3.** They are indeed good things (for each of them is put to the test by the excellent person's use, not the base person's); but it is a coincidental attribute of these same things that they are good,[11] and luck is the cause of their coming about. For it is due to luck that wealth comes about, and ruling office, and, in general, everything that has the rank of capacity. **4.** The fourth and last of the goods is what is preservative and productive of good, as athletic training is of health, and anything else of this sort.

5. But goods admit of yet another division: some of them are in every circumstance and in every way choiceworthy, while others are not. For example, justice and the other virtues are in every circumstance and in every way choiceworthy, while strength, wealth, capacity, and things of this sort are neither in every circumstance nor in every way so. **1184^{a}1**

6. Further, there is another way [of dividing them]. For some goods are ends, while others are not ends—for example, health is an end, while things that are for the sake of health are not ends. And whenever things stand in this relation, the end among them is always better (for example, health is better than healthy things), and unconditionally, always, and universally that thing is in fact better that the others are for the sake of.

7. Again, among ends themselves, the complete is always better than the incomplete. And a complete end is one that, when we have acquired it, we need nothing else in addition, while an incomplete one is one that, when we have acquired it, we do need something in addition—for example, when we have acquired justice alone[12] we need many things in addition, but when we have happiness we need nothing further in addition. Therefore, this is the best one for us, the one we are seeking, the one that is the complete end. The complete end, then, is the good and the good is the end.[13]

8. The next issue, then, is how must we investigate the best good? Is it itself to be counted among the others? But this is absurd. For since the best good is a complete end, and the complete end, simply speaking, would seem to be nothing other than happiness, and happiness is composed of many goods, then, if when investigating the best, one were also to count it among the others, it will be better than itself. For it itself is the best one. For example, take healthy things and health, and investigate which of all these is best. The best is health. If, then, it is better than all these,[14] it is also better than itself. An absurdity, then, results.

9. This, at any rate, is presumably not the way to investigate the best one. But [are we, then, to investigate it] in this way, at least—as separate from these goods?[15] Or

11. Reading τούτοις.
12. Reading μόνης.
13. Reading τὸ ἀγαθόν.
14. Reading τούτων.
15. Reading αὐτῶν.

is this also absurd? For happiness is composed of certain goods, and to investigate whether it is better than the goods of which it is composed is absurd. For happiness is not something separate from the things of which it is composed,[16] but is these.

10. Could one correctly investigate the best one in the following way, at least: by comparison? For example, by comparing happiness itself, which is composed of these goods, to other goods that are not present in it, would one, by investigating in this way, investigate the best good correctly? But the best good we are now seeking is not simple. For example, someone might say that practical wisdom is the best of all goods when they are compared one by one. **11.** But presumably this is not the way one must seek the best good. For we are seeking the complete good, and practical wisdom is not complete when it is alone. So it is not the best good that we are seeking, nor one that is best in this way.

1.3
Happiness

1184b1 **1.** Next, then, goods admit of another division. For some goods are in the soul—for example, the virtues; some in the body—for example, health, beauty; and some external—wealth, ruling office, honor, and anything else of this sort there may be. Of these, the ones in the soul are best. **2.** And the goods in the soul are divided into three: practical wisdom, virtue, and pleasure.

What at this point comes next, then, is the thing that we all say is—and that seems in fact to be—the end of the [other] goods, and the most complete one: happiness. And it, we say, is the same as doing well and living well. **3.** But the end is not simple but rather twofold; for of some things the end is the activity itself and the use—for example, the activity of sight is seeing.[17] And the use of something is more choiceworthy than the state.[18] For the use is the end. For no one would wish to have sight if he was not going to see but to have his eyes shut. It is the same way in the case of hearing and things of this sort. **4.** Therefore, among things of which there is a use and a state, the use is always better and more choiceworthy than the state. For the use and activity are the end, while the state is for the sake of the use.

5. Next, if one examines it in the case of all the sciences, one will see that a house is not made by one science that makes a house, and an excellent house by another, but rather [both] by the craft of building. And what the builder is able to produce is that very thing that his virtue is also able to produce.[19] It is the same way the case of all the others.

16. Reading χωρὶς τῶν ὑφ᾽ ὧν.
17. Reading ἐστιν ἡ ὅρασις.
18. I.e., of having it. See *Met.* 5.20.
19. Rejecting εὖ.

1.4
Happiness and Virtue

1. Next, we see that we live by nothing other than the soul; and in the soul there is virtue; and we say, surely, that the soul and the virtue of the soul produce the same thing. But the virtue in each thing produces well what the thing of which it is the virtue [produces], and though the soul also [produces] other things, it is by the soul that we live. Therefore, it is by means of the virtue of the soul that we will live well. **2.** But living well and doing well are, we say, nothing other than being happy. Therefore, being happy and happiness consist in living well, and living well consists in living in accord with the virtues. Therefore, this is the end, happiness, and the best [good]. **3.** It is in some use and activity, accordingly, that happiness would consist. For of things of which there is both a state and a use, as we saw,[20] the use and activity are the end. But virtue is a state of the soul. And there is an activity and use of the state's virtues. So the activity and use of it would be the end. Therefore, happiness would consist in living in accord with the virtues.

4. Since, then, the best good is happiness, and happiness is the end, and the complete end in activity, it would be by living in accord with the virtues that we would be happy and would have the best good.

5. Since, then, happiness is the complete good and end, we must not overlook the **1185^{a}1** fact that it will be present in what is complete. For it will not be present in a child (for a child is not happy), but in a man; for he is complete. Nor will it exist in an incomplete time, but in a complete one. And a complete one is the time of a human life. For it is correctly said among ordinary people that a life's happiness should be judged in its longest time, on the supposition that what is complete should exist in a complete time and a complete human being.

6. That happiness is an activity one can see also from the following: if someone were to pass his entire life lying in slumbers, no one would wish to say that such a person is happy; for, though life belongs to him, life in accord with the virtues—the one that we saw[21] to be in accord with activity—does not belong to him.

7. The next thing we are going to speak about might seem neither to very properly belong to our subject nor to be greatly far removed from it. I mean, since there is, as it seems, a part of the soul whereby we are nourished, which we call "nutritive"—(for it stands to reason that it exists; at any rate, we see that stones are incapable of being nourished; so it is clear that to be nourished is characteristic of animate things; and if it is characteristic of animate things, the soul would be its cause; **8.** but none of these parts of the soul—I mean the rationally calculative, the spirited, the appetitive—could be a cause of nourishing, but rather something else beyond these, for which we have no name that more properly belongs to it than "nutritive")—**9.** someone might say, "well

20. 1184^{b}14–16.
21. 1184^{b}34–36.

then, is there also a virtue of this part of the soul?" For if there is, it is clear that with respect to it too the soul will need to be active. For happiness is the activity of complete virtue. Whether or not there is a virtue of this part is for another account.[22] But if there is, there will be no activity of it. For of things where there is no impulse, there will be no activity either. And there seems to be no impulse in this part, but rather it seems to be like fire. For in its case too, whatever you throw into it,[23] it will devour, but if you do not throw something in, it has no impulse to get it. So it is too with this part of the soul. For if you throw in nourishment, it nourishes, but if you do not throw in nourishment, it has no impulse to nourish. That is why there is no activity of what there is no impulse of either. So this part does not even contribute to happiness.[24]

10. Next, then, we must say what virtue is, since the activity of it is happiness. To put it simply, then, virtue is the best state. But presumably it is not enough to put it so simply, but we must define it more perspicuously.

1.5
Parts of the Soul and Their Virtues; How the Virtues of Character Are Destroyed

1185b1 **1.** First, then, we must speak about the soul in which virtue arises—not about what the soul is (for to speak about this is for another account), but to determine it in outline. The soul, as we say, is divided into two parts, into the part that has reason and the non-rational part. In the part that has reason, then, these things are practical wisdom, acumen, theoretical wisdom, ease at learning, memory, and the like; in the non-rational part, those that are called "virtues": temperance, justice, courage, and whatever other things belonging to character seem to be praiseworthy. **2.** For it is in accord with these that we are said to be praiseworthy; but with respect to those of the part that has reason no one is praised. For no one is praised because he is theoretically wise, nor because he is practically wise, nor, in general, in accord with anything of this sort. Nor indeed is the non-rational part praised unless it is subservient to, and serves, the part that has reason.

3. Virtue of character is destroyed by deficiency and by excess. And that deficiency and excess destroy it is possible to see from outside the sphere of ethics,[25] though on behalf of non-evident cases evident ones must be used as testimony. For one can see this at once in the case of physical exercises. For strength is destroyed by too much, and likewise by too little. **4.** It is the same way too in the case of drink and food. For when there is too much, health is destroyed, and likewise when there is too little. But when it is proportional strength and health are preserved. Things like these also

22. *NE* 1102a26–b12.
23. Reading ἐκείνῳ.
24. Reading οὐδὲ.
25. Reading ἔξω τῶν ἠθικῶν.

happen in the case of temperance, courage, and the other virtues. For if you make someone too fearless, so that he does not fear even the gods, he is not courageous but mad, while if you make him afraid of everything, he is a coward. **5.** Therefore, a courageous person will neither be the one who fears everything nor the one who fears nothing. Therefore, these are the things that increase and destroy the virtue. For fearing too much, and being afraid of everything,[26] destroys it, as likewise does being afraid of nothing. But courage is concerned with fears, so that moderate fears increase courage. Therefore, courage is increased and destroyed by the same things. For this is how people are affected by fears. It is the same way too in the case of the other virtues.

1.6
Pain, Pleasure, and Habituation

1. Further, it is not only by these sorts of things that one should determine the virtues, but also by pain and pleasure. For it is because of pleasure that we do base actions, and because of pain that we abstain from noble ones. And, in general, it is not possible to get hold of virtue and vice without pleasure and pain. Virtue, then, is concerned with pleasures and pains.

2. Ethical virtue derives its names from this, if it is by the spoken letter that we must investigate in what way the truth lies (as perhaps we must). For character (*êthos*) derives its name from habit (*ethos*). For it is called "ethical (*êthikê*)" because of **1186ᵃ1** resulting from habituation (*ethizesthai*). **3.** From which too it is clear that none of the virtues of the non-rational part appear in us by nature. For none of the things that are by nature becomes otherwise by habit. For example, a stone, and heavy things in general, spatially move downward by nature. If one threw them upward many times, then, and tried to habituate them to spatially move upward, nonetheless they would never spatially move upward, but always downward. It is the same way too in the case of the other things of this sort.

1.7
Feelings, Capacities, and States; the Mean

1. Next, as we wish to say what virtue is, we must know what the things are that come about in the soul. The things that come about are these: feelings, capacities, states. So it is clear that virtue would be one of these.

2. Feelings are anger, fear, hatred, longing, jealousy, pity, and things of this sort, which are usually followed by pain or pleasure. Capacities are those things in virtue of which we are said to be susceptible to these feelings—for example, those things in

26. Reading πάντος.

virtue of which we are capable of feeling anger, pain, pity, and[27] things of this sort. **3.** States are those things in virtue of which we are well or badly disposed in relation to feelings—for example, in relation to feeling anger, if we are too irascible, we are badly disposed in relation to anger, while if we are not angry at all at the things we should, we are in this way too badly disposed in relation to anger. Therefore, the mean state is neither to feel too much pain [when angry] nor to be entirely insensitive to pain.

4. When we are in this state, then, we are well-disposed (likewise too[28] in relation to other things like this); for good-temper and mild-manneredness are in a state that is a mean between anger and insensitivity to the pain in relation to anger. It is the same way too[29] in the case of boastfulness and self-deprecation. For to pretend to have more than one has is boastfulness, while to pretend to have less is self-deprecation. Therefore, the mean state between these is truthfulness.

1.8
More on Feelings and the Mean

1. It is the same way too in the case of all the other feelings. For this is what is characteristic of a state, being well or badly disposed in relation to these. And to be well-disposed in relation to them is to be disposed neither toward excess nor toward deficiency. Therefore, the state of being well-disposed is directed toward a mean in the sorts of things with regard to which we are said to be praiseworthy, while that of being badly disposed is directed toward excess or deficiency. **2.** Since, then, virtue is a mean state of these feelings, and feelings are either pains or pleasures, or not without pain or pleasure, it follows that virtue is concerned with pains and pleasures. From this too it is clear.

3. It might seem to someone that there are also other feelings, in which vice does not consist in an excess or deficiency of any sort—for example, adultery[30] and the adulterous person; for[31] the adulterous person is not the one who corrupts free women too much. But both this and anything else of this sort, that encompasses intemperate pleasure, both the one in deficiency and the one in excess, are blameworthy.

1.9
Excess, Deficiency, and the Mean

1. Next, it is necessary, presumably, to say what—whether the excess or the deficiency—is opposed to the mean state. For to some mean states the deficiency is

27. Retaining καὶ.
28. Retaining καὶ.
29. Retaining καὶ.
30. Reading ἡ μοιχεία.
31. Reading οὐ γὰρ.

opposed and to some the excess. For example, to courage it is not rashness, which is an excess, that is opposed, but cowardice, which is a deficiency; and to temperance, which is a mean state between intemperance and insensitivity to pleasure, it does not seem that insensitivity, which is a deficiency, is opposed, but intemperance, which is an excess. **2.** Both, however, are contrary to the mean state, both the excess and the deficiency. For the mean state is more deficient than the excess, but exceeds the deficiency. That is also why wasteful people say that generous ones are ungenerous, while ungenerous ones say that generous ones are wasteful, and why rash and impetuous people say that courageous people are cowards, while cowards say that courageous ones are impetuous and mad.

3. It would seem to be due to two causes, then, that we oppose the excess and the deficiency to the mean state. For one way is based on the thing itself, when we inquire as to which is closer to the mean or further away—for example, whether wastefulness or ungenerosity is further away from generosity. For wastefulness would seem to be more like generosity than ungenerosity does. Therefore, ungenerosity is further away. **4.** And things further away from the mean would seem to be more contrary to it. Therefore, based on the thing itself, the deficiency seems to be more contrary. But there is also another way, that the things we are naturally more inclined to are the ones that are more contrary to the mean. For example, we are naturally more inclined to be intemperate than moderate. Our growth, then, is more toward what we are naturally inclined to. And the things we more grow toward are the ones that are more contrary. We more grow toward intemperance than toward moderation. So [what is in] excess of the mean would be more contrary. For intemperance is excess of temperance.

5. What virtue is, then, has been investigated. For it seems to be a certain mean state of the feelings. So it would be necessary for the person who is going to enjoy a good reputation for his character to maintain the mean state in each of his feelings. **6.** That is why indeed it takes work to be excellent. For in each area getting hold of the mean (*meson*) takes work—for example, everyone can draw a circle, but to then get hold of the mid-point (*meson*) in it is difficult. Likewise too, while being angry is easy, as is the contrary of this, to be in a mean is difficult. Putting it simply, in each of the **1187ª1** feelings one can see that what encompasses the mean[32] is easy, while the mean—the thing for which we are praised—is difficult. That is also why what is excellent is rare.

7. Since, then, virtue has been spoken about, we must next investigate whether it is possible to attain it or not, but rather, as Socrates said,[33] coming to be virtuous or being base is not up to us. For if, he says, one were to ask anyone whatever whether he would wish to be just or unjust, none would choose injustice. **8.** Likewise in the case of courage, cowardice, and the other virtues, it is always the same way. And it is

32. Reading μὲν περιέχον. I.e., the deficiency on one side and the excess on the other.
33. E.g., *Meno*, 78a, *Sophist* 228c, *Timaeus* 86d–e.

clear that if some people are base, they cannot be base voluntarily. So it is clear that they cannot be excellent voluntarily either.

9. This sort of argument is not true. For why does the legislator not allow the doing of base actions, and order the doing of noble and excellent ones? And why does he assign a penalty for base ones, if one does them, and for noble ones, if one does not do them? And yet it would be absurd to legislate about things that are not up to us to do. **10.** But, as it seems, it is up to us to be excellent or base. Further, the praises and blames that result testify to this. For there is praise for virtue and blame for vice. But praise and blame are for voluntary things.[34] So it is clear that it is alike up to us to do both excellent things and to do base ones.

11. People wishing to prove that vice is not voluntary also drew a comparison of the following sort. For why, they say, when we are ill or ugly, does no one blame people of this sort? But this is not true. For we do blame people of this sort, when we think that they themselves are the causes of their being ill or of having their body in a bad state, on the supposition that even there the voluntary is present. It seems, then, that the voluntary is present in our being in accord with virtue and with vice.

1.10
Starting-Points

1. Further, one can also see this more clearly from the following considerations. For every nature generates a substance of the same sort as itself—for example, plants and animals; for both are generative. And they are generative from starting-points—for example, the tree from seed; for this is a sort of starting-point. And what follows the starting-points is like this; for as the starting-points are so also are the things that follow the starting-points.

2. One can see this more clearly in the case of geometry. For there too when certain things are taken as starting-points, as starting-points are so also are the things that follow the starting-points—for example, if the triangle has angles equal to two right angles, the quadrilateral has angles equal to four, and as the triangle changes, so too the quadrilateral changes with it. For it is convertible—that is, if the quadrilateral does not have its angles equal to four right angles, neither will the triangle have its angles equal to two right angles.

1.11
Starting-Points of Voluntary Action

1. It is this way, then, and like these cases, in the case of a human being too. For since a human being is generative of a substance, it is from certain starting-points too that

34. Omitting οὐκ and reading ἑκουσίοις.

he is generative of the actions a human being does. For what else could do so? For we do not say that any of the inanimate things do actions, nor any of the animate ones, except human beings. It is clear, then, that a[35] human being is generative of actions.

2. Since, then, we see actions changing, and we never do the same ones, and the actions have been generated from certain starting-points, it is clear that, since the actions change, the starting-points of the actions, from which they come, change too, just as we said in the case of the ones in geometry.

3. But the starting-point of an action, both of an excellent one and of a base one, is deliberate choice and wish, and all of what is in accord with reason. Therefore, it is clear that these too change. But we also change in our actions voluntarily; so the starting-point—the deliberate choice—also changes voluntarily. So it is clear that it would be up to us both to be excellent and to be base.

4. But perhaps someone might then say, "Since it is up to me to be just and to be excellent, if I wish it, I will be the most excellent of all." But this, of course, is not possible. Why? Because in the case of the body it is not possible either. For if someone wishes to take care of his body, it does not follow that he will have the best body of all. For not only must care be present, but also the body must be by nature noble and good. His body, then, will be better, but best of all it will not be. **5.** We must suppose it to hold in the same way also in the case of the soul; for the one who deliberately chooses to be most excellent will not be so unless the relevant nature is also present, but it will certainly be better.

1.12
The Voluntariness of Actions Due to Appetite

1. Since, then, it appears that to be excellent is up to us, it is necessary next to say about the voluntary, what the voluntary is. For this is a[36] most controlling factor when it comes to virtue.[37] The voluntary, to state it simply in this way, is what we do not under compulsion. But presumably we must speak more perspicuously about it.

2. What we act in accord with is desire. And of desire there are three forms: appetite, spirit, and wish.

First, then, we must investigate the action that is in accord with appetite to see whether it is voluntary or involuntary. But it would not seem to be involuntary. Why? On what grounds? Because whatever actions we do not do voluntarily we do[38] under **1188^{a}1** compulsion, and everything we do from compulsion is accompanied by pain. But with those we do because of appetite pleasure follows along. So, to this extent at least, actions done because of appetite would seem to be not involuntary, but voluntary.

35. Omitting ὁ.
36. Omitting τὸ.
37. Omitting τὸ ἑκούσιον.
38. Reading ποιοῦμεν.

3. But, again, there is another argument contrary to this, the one depending on lack of self-control. For no one, it says, voluntarily does bad actions, knowing that they are bad. Yet the person who lacks self-control, it says, knowing that the things are base, does them nonetheless, and does them indeed in accord with appetite. Therefore, he does not do them voluntarily. Therefore, he does them under compulsion. **4.** But here again the same argument will meet it. For if in fact he does them in accord with appetite, he does not do them from compulsion. For with appetite pleasure follows along, and what we do because of pleasure, we do not do from compulsion.

And there is another way in which this—that the person who lacks self-control acts voluntarily—may be made clear. For those who do injustice do injustice voluntarily, and those who lack self-control are unjust and act unjustly. So the person who lacks self-control would do voluntarily the actions that he does in accord with his lack of self-control.

1.13
The Voluntariness of Actions Due to Appetite, to Spirit, and to Wish

1. But, again, there is another argument contrary to this, which claims that [action in accord with appetite] is not voluntary. For the self-controlled person does voluntarily what he does in accord with his self-control; for he is praised; and people are praised for what is voluntary. But if what is in accord with appetite is voluntary, what is contrary to appetite is involuntary; and the self-controlled person acts contrary to appetite. So the self-controlled person would not be self-controlled voluntarily. But that does not seem to be so. Therefore, what is in accord with the[39] appetite is not voluntary either.

2. Again, it is the same way in the case of what is in accord with spirit; for the very same arguments apply as also apply to appetite, so that they will produce the [same] puzzle. For it is possible for someone to lack self-control and have self-control pertaining to anger.

3. Further, among the desires we distinguished, it remains to investigate wish, to see whether it is voluntary. But surely those who lack self-control, at any rate, wish at the time for what they are impelled toward. Therefore, those who lack self-control do base actions while wishing to do them. But no one voluntarily, at any rate, does bad things while knowing them to be bad. But the person who lacks self-control, while knowing that the bad things are bad, does them wishing to do so. Therefore, he is not doing them voluntarily. Therefore, wish is not voluntary either. **4.** But this argument does away with lack of self-control and the person who lacks self-control. For if he is not acting voluntarily, he is not blameworthy. But the person who lacks self-control is blameworthy. Therefore, he acts voluntarily. Therefore, wish is voluntary.

Since, then, certain arguments appear to be contraries, something more perspicuous must be said about the voluntary.

39. Reading τὴν.

1.14
Force and Compulsion (1)

1. First, then, we must speak about force and about compulsion. For force exists even in inanimate things. For to each[40] of the inanimate things a proper place is assigned—to **1188^{b}1**
fire the upper one, to earth the lower. Yet it is possible to force a stone to spatially move upward and fire downward. **2.** It is also possible to force an animal [to do something]—for example, when a horse is running straight ahead, to turn it aside by taking hold of it. 5
Whenever, then, the cause of their doing something contrary to nature, or contrary to what they wish to do, is external, we will say that they are forced[41] to do what they do. But whenever the cause is within themselves, we will no longer say that they are forced. **3.** Otherwise, the person who lacks self-control will contradict us, saying that he is not base; for he will say that he is forced by his appetite to do base things. 10

1.15
Force and Compulsion (2)

1. Let this, then, be our definition of what involves force: those things of which the cause of being forced to do them is external (but where the cause is internal and within the agents themselves there is no force). And we must again speak about compulsion and the compulsory. Compulsion is not something we must speak of in all circumstances and in everything—for example, in what we do for the sake of 15
pleasure. For if someone were to say, "I was compelled by pleasure to corrupt my friend's wife," it would be absurd.[42] **2.** For compulsion is not found in everything, but in fact in things that are external—for example, if someone were compelled by circumstances to incur one harm in exchange for another greater one. For example, 20
"I was compelled to proceed more eagerly to the country; for otherwise I would have found the crops destroyed." Compulsion, then, is found in things of this sort.

1.16
The Voluntary Is What Proceeds from Thought

1. But since the voluntary is found in no impulse, what proceeds from thought would 25
remain. For the involuntary is what is done in accord with compulsion, in accord with force, or, thirdly, what is not done with thought. This is clear from the facts. For when someone hits or kills someone, or does anything of this sort, without having

40. Reading ἑκάστῳ.
41. Reading βιαζομένους.
42. Reading ἄτοπον.

thought about it beforehand, we say that he acted involuntarily on the supposition that the voluntary is found in the having thought. **2.** For example, they say that a woman once gave someone a love-potion to drink, then the man died due to the love-potion, and the woman was put on trial before the Areopagus. Having come before it, she was acquitted, because of nothing other than absence of forethought. For she gave it for love, but failed utterly in this. That is why it did not seem to be voluntary, because she gave him the dose of love-potion not with a thought of killing him. Therefore, in that case the voluntary falls into what is [done] with thought.

1.17
Deliberate Choice

1189a1 **1.** It further remains for us to investigate deliberate choice, as to whether or not it is desire. For while desire is found also in the other animals, deliberate choice is not. For deliberate choice involves reason, and reason is not present in any of the other animals. It could not, then, be desire.

2. But is it wish, at least? Or is it not this either? For wish is also for impossible things—for example, we wish to be immortal, but we do not deliberately choose to be. Further, deliberate choice is not of the end, but of what furthers the end—for example, no one deliberately chooses to be healthy, rather, we deliberately choose the things (walking, running) that further health. But we do wish for ends. For we wish to be healthy. **3.** So it is clear in this way too that wish and deliberate choice are not the same thing.

Deliberate choice does seem to be the way its name[43] (*prohairesis*) also suggests. For we deliberately choose one thing in place of (*anti*)[44] another—for example, the better in place of the worse. When, then, we can opt for the better in place of the worse in making a choice, there "deliberate choice" would seem to properly belong.

4. Since, then, deliberate choice is none of these things, is it in what is in accord with thought, at least, that deliberate choice is found? Or is it not this either? For we think and believe many things in accord with thought. Are the things we think about, then, also the ones we deliberately choose? For we often think about things in India, but we do not in fact deliberately choose any of them. Therefore, deliberate choice is not thought either.

5. Since, then, deliberate choice is none of these things, taken severally, but these are the things that take place in the soul, it is necessary for deliberate choice to be a combination of some of these. Since, then, as was said before,[45] deliberate choice is of goods that further the end, not of the end, of things that are possible for us, and of things that provide grounds for dispute as to whether this or that is more

43. Reading τοὔνομα.
44. *Anti* means much the same as *pro*.
45. 1189a7–8.

choiceworthy,[46] it is clear that we must first think and deliberate about them, and then, when one appears better to us, after having thought it over, there is an impulse to act in this way, and when doing this, then, we seem to be acting in accord with deliberate choice.

6. If, then, deliberate choice is a deliberative desire involving thought, what is voluntary is not what admits of deliberate choice. For we do many actions voluntarily before having thought and deliberated—for example, we sit down, stand up, and do many other things of this sort voluntarily without thinking, but things done in accord with deliberate choice, we saw,[47] are all done with thought. **7.** Therefore, what is voluntary is not what admits of deliberate choice, but what admits of deliberate choice is voluntary. For if we deliberately choose to do something after deliberating, **1189^{b}1** we act voluntarily. And even among legislators a few appear to distinguish what is voluntary as being something other than what is done from deliberate choice, in assigning lesser penalties for voluntary actions than for those in accord with deliberate choice.

8. Deliberate choice, then, is found in matters of what is doable in action, and in those in which it is up to us either to act or not to act, in this way or not in this way, and in which it is possible to grasp the why. But the why is not simple. **9.** For in geometry, when one says that the quadrilateral has angles equal to four right angles, and someone asks why, one says, "because the triangle also has angles equal to two right angles." In cases of this sort, then, we reach[48] the why on the basis of a definite starting-point. But in matters of what is doable in action, in which deliberate choice is found, it is not this way (for there is no definite starting-point laid down), and if one asks, "Why did you do this?" the answer is, "Because there was no other way," or "Because it was better this way." Whichever[49] of the consequences appears to be better, this is what he deliberately chooses, and [does so] because of it. **10.** That is why, then, in these matters deliberating is deliberating how one should do things, while in the sciences it is not. For no one deliberates about how one should write the name "Archicles," because how one should write the name "Archicles" is something definite. Error, then, does not occur in thought, but in the activity of writing. For in cases in which error[50] is not in thought no one deliberates either. On the contrary, it is only in those cases in which how one should do things is indefinite that error comes in.

11. In matters of what is doable in action, however, there is this indefiniteness, and in those in which errors are twofold. We err, then, in similar ways in matters of what is doable in action and in ones that are in accord with the virtues. For in aiming at virtue we err in the natural directions. For it is both in deficiency and

46. Reading αἱρετώτερον.
47. 1.16.
48. Reading ἐλάβομεν.
49. Omitting ἐξ and the comma after συμβαινόντων and reading ὁποῖον and τοῦτον.
50. Omitting ἡ.

in excess that error is found, and we are carried toward each of them because of pleasure and pain; for because of pleasure we do base actions and because of pain we avoid noble ones.

1.18
Ends and What Furthers Them

1. Further, thought is not like perception—for example, with sight one cannot do anything other than see, nor with hearing anything other than hear. Similarly, we do not deliberate about whether we should hear with hearing or see with it. But thought is not like that, but is able to do both this and other things. That is why deliberation[51] comes in here from the start. **2.** Error in choosing good things, then, is not concerning ends (for everyone agrees about these—for example, that health is good), but in fact about what furthers the end—for example, about whether eating this is good for health or not. And what most of all makes us fail in these matters is pleasure and pain; for we avoid the latter and choose the former.

3. Since, then, it has been determined in what error is found and in what way, it remains to determine what virtue aims at, whether at the end or at what furthers the end—for example, whether at the noble or at what furthers the noble.

4. How is it, then, with science? Does it belong to the science of building to set up the end correctly, or to see what furthers the end? For if this is set up correctly, for example, to make a noble house, then no one else besides the builder will also discover and provide what furthers it. It is the same way too in the case of all the other sciences.

5. Therefore, it would seem to be likewise in the case of virtue too, that its target is more related to what furthers the end, which it must set up correctly, than to the end.[52] And no one other than [the virtuous person] will provide the things this will come from, or discover what is needed to further it. But it is also reasonable that virtue be capable of setting up the end wherever the starting-point is of the best thing; for[53] each [science and virtue] is capable both of setting it up and producing it. Nothing, then, is better than virtue. For the other things are for its sake, and the starting-point is in relation to virtue; and what furthers the end is more for the sake of it. **6.** But the end seems to be a sort of starting-point, and each thing is for the sake of it. And it is reasonable that it will be. So it is clear in the case of virtue too that, since it is the best cause, it aims at the end more than at what furthers the end.

52. Reading τὸν σκοπὸν πρὸς τὰ πρὸς τὸ τέλος . . . ἢ πρὸς τὸ τέλος.
53. Reading τὴν ἀρετήν, ἐν οἷς ἡ ἀρχὴ τοῦ βελτίστου ἐστίν. ἕκαστον γὰρ καὶ. . ..

1.19
Virtue's End Is the Noble

1. But of virtue, at any rate, the end is the noble. Therefore, this is what virtue will aim at more than the things this will come from. Yet it is also concerned with these. For these, then,[54] to be its whole concern is manifestly absurd. For presumably in painting someone might be a good imitator of things and yet not be praised, if he did not set up as his target to imitate the best things. Therefore, this is entirely the concern of virtue, to set up the noble.

2. Why, then, someone might ask, did we say previously[55] that the activity is better than the state itself,[56] while now we are assigning to virtue as something nobler, not what the activity comes from, but what there is no activity present in? **3.** Yes, but now too we equally assert this, that the activity is better than the state. For when other people look at the excellent person, they judge him on the basis of the actions he does, because it is not possible to make clear a given person's deliberate choice, since if it were possible to know how a given person's consideration stands in relation to the noble, he would have seemed excellent even without his doing any actions.

Since we enumerated[57] the mean states of certain feelings, we must state what sorts of feelings they are concerned with.[58]

1.20
Courage

1. Since, then, courage is concerned with feelings of confidence and fear, we must investigate what sorts of feelings of confidence and fear it is concerned with. If, then, someone is afraid of losing his property, is he a coward? And if someone is confident concerning such things, is he courageous? Surely not! Likewise, if someone is afraid or confident concerning illness, one must not say either that the one who is afraid is a coward or that the one who is not afraid is courageous. Therefore, it is not in feelings of fear and of confidence of these sorts that courage is found. **2.** But then it is not found in those of the following sorts either—for example, if someone is not afraid of thunder, lightning, or any other object of fear that is beyond the human level, he is not courageous, but a sort of mad person. It is in cases of feelings of fear and confidence that are on a human level, then, that the courageous person is found.

54. Reading τε δὴ.
55. $1184^{b}15$–16, 33–35.
56. Reading τὴν ἕξιν αὐτήν.
57. $1185^{b}21$–32, $1186^{b}4$–12, 32.
58. Retaining ἐπεὶ . . . εἰσίν.

I mean, for example, in things many people, or all people, are afraid of—the one who is confident in these things is the one who is courageous.[59]

3. With these matters determined, then, we must, since courageous people are so in virtue of many things, investigate what sort of person the courageous person is. For it is possible for someone to be brave in virtue of experience—for example, soldiers. For they know because of experience that in such-and-such a place, or at such-and-such a time, or in such conditions it is impossible to suffer any damage. But the one who knows these things, and because of them endures the enemies is not courageous. **4.** For if none of these things obtains, he will not endure.[60] That is why one should not call "courageous" those who are so because of experience. But[61] nor did Socrates speak correctly when he said[62] that courage is scientific knowledge. For scientific knowledge becomes scientific knowledge by getting experience from habit. But we do not say, and nor will people say, that those who endure because of experience are courageous.[63] Therefore, courage would not be scientific knowledge.

5. Again, there seem to be[64] some, on the other hand, who are courageous from the contrary of experience. For those who have no experience of what is likely to happen are not afraid—because of their inexperience. Neither, then, must we say that these people are courageous.

6. Again, there are some who seem courageous because of their feelings—for example, those who are in love or possessed by a god. We must not say, then, that these are courageous either. For if the feeling is taken away, they are no longer courageous, while the courageous person must always be courageous. **7.** That is why one would neither say that wild beasts, such as boars, are courageous because they defend themselves, since they do so when they are in pain due to being struck, nor should a courageous person be courageous because of feeling.

8. Again, there seems to be another sort of courage, which seems to be political—for example, if people endure dangers because of shame in front of the citizens, and so seem to be courageous. A sign of this is that Homer represents Hector in his poem as saying:

> Polydamas will be the first to heap disgrace on me.[65]

That is why he thinks he must fight. This sort, then, must not be said to be courage either. For the same definition will apply to each of them. For one whose courage does not endure when something is taken away will not be courageous any longer. If,

59. Reading ἅ πάντες, ὁ ἐν. . ..
60. Reading ὑπομενεῖ.
61. Reading δέ.
62. E.g., Plato, *Laches* 199a–b.
63. Omitting αὐτοὺς.
64. Reading δοκοῦσιν.
65. *Iliad* 22.100.

then, I take away the shame because of which he was courageous, he will no longer be courageous.

9. Further, there is also another way in which people seem to be courageous, because of hope and expectation of good. We must not say that these people are courageous either, since it is manifestly absurd to say that such people in such circumstances are courageous.

No one, then, of the above sorts must be set down as courageous. We must investigate, then, what sort is courageous, and who the courageous person is. **10.** Simply speaking, then, it is the one who is courageous because of none of the things mentioned, but because of his thinking it a noble thing, and doing it whether anyone is present or not.

Not, indeed, that courage arises entirely without feeling and impulse. But the impulse must come about from reason, because of the noble. For the one who is impelled to face dangers because of reason and for the sake of the noble, since he is free of fear concerning these, is the one who is courageous, and courage is concerned with these. **11.** But not "free of fear" in the sense that when a person happens to be courageous he feels no fear at all. For a person of that sort, to whom nothing is frightening, is not courageous. For in that sense a stone and other inanimate things would be courageous. But, though feeling fear, he must endure. For if, on the contrary, he endures without feeling fear, he would not be courageous.

12. Further, in keeping with the distinction we drew above, courage is concerned not with all fears and dangers, but only with those that threaten to do away with our existence. Further, not at any and every time, but when the fears and dangers are nearby. For if someone is not afraid of a danger that is ten years away, he is not yet courageous. For some are confident because of its being very far away, but when they come near it, they are ready to die of fear.

1.21
Temperance

1. Courage, then, and the courageous person are of this sort, while temperance is a mean state between intemperance and insensitivity concerning pleasures. For temperance—as, in general, all the virtues—is the best state; the best state is what has what is best; and what is best is the mean between excess and deficiency. For people $1191^{b}1$ are blameworthy with respect to both—both with respect to excess and with respect to deficiency. So that, if indeed the mean is best, temperance would be a sort of mean state between intemperance and insensitivity.

2. It would, then, be a mean state between these. But temperance is concerned with pleasures and pains—though not with all of them or those concerned with everything. For, it is not the case that if someone takes pleasure in looking at a picture or a statue or something else of this sort he is in this way, then, intemperate. Nor, in

the same way, is he so concerning hearing or smelling, but [only] in the pleasures of touch and taste.

3. Nor, then, will the man whose state is such that he is not affected by even a single pleasure of this sort be temperate concerning these (for a person of this sort is insensitive). Instead, the one who in fact does feel them, and is not so carried away by them that, by indulging in them to excess, he makes everything else to be secondary works, and who in fact acts for the sake of the noble itself and not anything else, is [the one we say is] temperate. **4.** For whoever avoids the excess of such pleasures either because of fear or because of something else of this sort is not temperate. For neither do we say that the various animals, except for a human being, are temperate, because they do not have the reason in them with which [human beings] examine[66] the noble and choose it. For all virtue is for the sake of the noble and with an eye to the noble.

So temperance would be concerned with pleasures and pains, and of these, the ones that arise in touch and taste.

1.22
Mild-Manneredness

1. The next thing would be to speak about mild-manneredness, what it is and in what it is found in. Mild-manneredness, then, is a mean between irascibility and spiritlessness. And, in general, the virtues seem to be certain sorts of mean states. And that they are mean states, one might also argue in this way: if the best is in a mean, and virtue is the best state, and the mean is best,[67] virtue would be the mean. **2.** But this will be clearer if we investigate them one by one.

For an irascible person is the one who gets angry with everyone, in all circumstances, and to too great an extent, and someone of this sort is blameworthy (for one should not get angry with everyone, at everything, in all circumstances, or always), nor again, contrariwise, should one be in such a state as never to get angry with anyone (for in fact such a person is blameworthy too, since he is insensitive). **3.** Since, then, the excessive one is blameworthy, as is the deficient one, the one in a mean between these would be mild-mannered and praiseworthy (for neither the one who is deficient in anger nor the one who is excessive is praiseworthy, but the one whose state in relation to these things is in a mean is the one who is mild-mannered), and mild-manneredness would be a mean in these feelings.

66. Reading δοκιμάζοντες.
67. Retaining βέλτιστον . . . μέσον.

1.23
Generosity

1. Generosity, for its part, is a mean state between wastefulness and ungenerosity. Feelings of this sort are concerned with money. For the wasteful person is the one **1192^{a}1**
who spends on what one should not, more than one should, and when one should not, while the ungenerous person, who does the contrary of this, is the one who does not spend on what one should, as much as one should, or when one should. **2.** Both are blameworthy. For one of them is blameworthy in the direction of deficiency and the other in the direction of excess. Therefore, the generous person, since 5
he is praiseworthy, would be in a mean between these,[68] who spends on what one should, as much as one should, and when one should.

1.24
Generosity and Ungenerosity

1. Of ungenerosity there are in fact several forms—for example, the ones we call "skinflints," "cheeseparers," "shameless lovers of profit," and "stingy people." All these 10
fall under ungenerosity. For the bad is multiform, while the good is uniform—for example, health is simple, while disease is multiform. Likewise, virtue is simple, while vice is multiform. For all these people are blameworthy where money is concerned.

2. Does it, then, belong to the generous person also to acquire and provide himself 15
with money? Surely not! For such things do not belong to any other virtue either. For it does not belong to courage to make weapons, but rather to something else, whereas it does belong to it, when it has got these, to make correct use of them. It is the same way in the case of temperance and the others. This, then, does not belong to generosity, but in fact to the craft of wealth acquisition. 20

1.25
Greatness of Soul

1. Greatness of soul is a mean state between conceitedness and smallness of soul, concerned with honor and dishonor, and with honor not from[69] many people but from excellent ones, and it should[70] rather be with this; for excellent people will bestow honor by knowing and judging correctly. The great-souled person will wish, then, rather to be honored by those who know, as he does himself, that he 25

68. Omitting τίς οὖν ἐστίν; ὁ. . . .
69. Omitting τῶν.
70. Reading δεῖ.

deserves honor. For he will not be concerned with every honor, but with the best, and with the good that is estimable and has the rank of a starting-point. **2.** Those people, then, who are despicable and base, but who think themselves worthy of great things, and in addition think they should be honored, are conceited; while those who think themselves worthy of less than what is fitting for them, are small-souled. **3.** The person, then, who is in a mean between these is the one who neither thinks himself worthy of less honor than is fitting for him, nor of greater honor than he deserves, nor of every sort of honor. He is the great-souled person. So it is clear that greatness of soul is a mean state between conceitedness and smallness of soul.

1.26
Magnificence

1. Magnificence is a mean state between pretentiousness and niggardliness. Magnificence is concerned with [large] expenditures where appropriateness is fitting. **1192b1** Whoever, then, expends them where one should not is pretentious—for example, if someone provides a feast for his dining club as if he is providing a feast for a wedding, such a person is pretentious. For the pretentious person is the sort of person who shows off his prosperity on occasions when one should not. **2.** The niggardly person is the contrary of this. He will not make a large expenditure when one should or not spend at all, for example, on wedding feasts or on a chorus for a play, or not do so in a worthy way but in a deficient one. The person of this sort is niggardly.

3. Magnificence from its very name is manifestly of the sort that we say; for since it spends large amounts (*mega*) on the appropriate (*prepon*) occasion, it is correctly given the name "magnificence" (*megaloprepeia*). Therefore, magnificence, since it is praiseworthy, would be a certain mean state between deficiency and excess, concerning appropriate [large] expenditure on the requisite occasions.

4. But there are, as people think, several sorts of magnificence—for example, they say "he went around in a magnificent way," and other such things of course are said to be "magnificent" metaphorically, not in a strict sense. For it is not these that magnificence is found in, but in the things we mentioned.

1.27
Indignation

1. Indignation is a mean state between envy and spite; for both of these are blameworthy, but the indignant person is praiseworthy. Indignation is a sort of pain concerning good things, ones that belong to a person unworthy of them. An indignant

person, then, is the one who feels pain at such things, and this same person again will feel pain if he sees someone doing badly who does not deserve it. **2.** Indignation, then, and the indignant person are presumably of this sort. But the envious one is the contrary of this. For he simply feels pain if someone is doing well, whether it is deserved or not. In a similar way to him the spiteful person will be pleased when someone is doing badly, whether it is deserved or not deserved. The indignant person is not of this sort,[71] but rather a mean between them.

1.28
Dignity

1. Dignity is a mean between being surly and being ingratiating, and is concerned with social intercourse. For the surly person is the sort not to have social intercourse or conversation with anyone; his name seems to have been given to him from his mode [of character] (for the surly person (*auth-adês*) is someone who is self-satisfied (*auto-adês*), from being satisfied with himself). **2.** The ingratiating person, on the other hand, is the sort to have social interaction with anyone, in any circumstances, and anywhere. Neither of these, then, is praiseworthy, while the dignified person, since he is in a mean between them, is praiseworthy. For he has social interaction neither with everyone, but with those who are worthy, nor with no one, but with these same ones.

1.29
Shame

1. Shame is a mean state between shamelessness and bashfulness, and is concerned with actions and words. For the shameless person is the one who on any occasion, and in front of anyone, says and does random things, while the bashful person is the contrary of this, and is wary of doing or saying anything in front of[72] anyone (for the person of this sort—the one who is bashful about everything—is incapable of action). **2.** But shame and the shameful person are a mean between these.[73] For he will not say or do just anything in any circumstances, like the shameless person, nor, like the bashful one, be wary on every occasion and in all circumstances, but will do and say where one should, what one should, and when one should. **1193^{a}1**

71. Retaining τοιοῦτος.
72. Retaining πρὸς.
73. Omitting τις.

1.30
Wit

1. Wit is a mean state between buffoonery and boorishness, and is concerned with jibes. For the buffoon is the one who thinks one should jibe at everyone and everything, while the boor is the one who wishes[74] neither to jibe nor to be jibed at, but gets angry. **2.** But the witty person is a mean between these, who neither jibes at everyone and in all circumstances, nor is himself a boor. For the witty person will be said to be such in a sort of twofold way; for both the one who can jibe in a suitable way and the one who can take being jibed at are witty; wit too is like this.

1.31
Friendliness

1. Friendliness is a mean state between flattery and enmity, and is concerned with actions and words. For the flatterer is the one who adds more than is fitting and is really there,[75] while the one who is full of hatred is an enemy and subtracts even what is present. Neither, then, is correctly praised. **2.** But the friendly person is a mean between these. For he will not add more than what belongs, nor praise what is not fitting, nor, on the contrary, will he make less of things, or in all circumstances set himself in opposition, contrary to what seems so to him.

1.32
Truthfulness

1. Such, then, is the friendly person. Truthfulness is between self-deprecation and boastfulness. It is concerned with words, but not with all of them. For the boaster is the one who pretends to have more than he has, or to know what he does not know, while the self-deprecator is the contrary of this, and pretends to have less than he has, and does not say what he knows, but rather hides his knowledge. **2.** But the truthful person will do neither of these things. For he will pretend to have neither more than he has nor less, but what he has he will say he has and what he knows he will say he knows.

Whether these are virtues or not virtues, would be for another account; but that they are mean states between the things mentioned is clear. For those who live in accord with them are praised.

74. Omitting δεῖν.
75. Reading προσόντων.

1.33
Justice

1. It remains to speak about justice—what it is, what it is found in, and what sorts of things it is concerned with. First, then, if we wish to grasp what the just is, the **1193^{b}1**
just is twofold, of which one is the just in accord with the law. **2.** For people say that what the law prescribes is just. But the law orders the doing in action of courageous things, temperate things, and, in general, all the things that are said to be in accord with the virtues. That is also, they say, why justice seems to be a sort of complete 5
virtue. For if the things that the law orders us to do are just, and the law prescribes what is in accord with all the virtues, then the one who abides by what is just in accord with the law will be completely[76] excellent, so that the just person and justice are a sort of complete virtue.

3. One sort of justice, then, is found in these things and is concerned with these 10
things. But it is not the just in this sense, nor the justice concerned with these things, that we are seeking. For with respect to these just things it is possible to be just when by oneself; for the temperate, courageous, and self-controlled person[77] can be such when by himself. But the just in relation to another is a different thing than the just 15
in accord with the law that was mentioned. For in things that are just in relation to another it is not possible to be just by oneself. But it is the just in this sense that we are seeking, and the justice concerned with these things.

4. The just, then, that is in relation to another is, simply speaking, the equal. For the unjust is the unequal. For when people allocate more of the good things to 20
themselves and fewer of the bad ones, this is unequal. And in these cases, people think, one does injustice and suffers injustice. Therefore, it is clear that since injustice is found in unequal things, justice and the just must lie in equal transactions. **5.** So it is clear that justice is a sort of mean state between excess and deficiency, between too 25
much and too little. **6.** For the unjust person, by doing injustice, has more, and the one suffering injustice, by suffering injustice, has less. But the mean between these is just. And the mean is equal. So the equal between too much and too little would be just, and the one who wishes to have the equal would be just. **7.** But the equal arises 30
between at least two things. Therefore, being equal in relation to another is just, and the person of this sort would be just.

8. Since, then, justice is found in just, equal, and mean, and what is just is said to be just as between certain people, and the equal to be equality between certain ones,[78] and the mean to be a mean between certain ones, the result is that justice and the just 35
will also be in relation to certain people and between certain ones.

76. Reading τελέως.
77. Omitting ὁ^{2} and ὁ^{3}. See $1203^{b}12–23$.
78. Reading καὶ . . . ἔν τισι . . . τισιν.

9. Since, then, the just is equal, the proportionally equal would be just too. And the proportional is found in, at a minimum, four things: as A is to B, C is to D. For example, it is proportional that the one who has much contribute much, and that
1194a1 the one who has little contribute little; again, in the same way, that the one who has labored much receive much, and that the one who has labored little receive little. And as the one who has labored is to the one who has not labored, so much is to little; and as the one who has labored is to much, so the one who has not labored is to little.

10. Plato also seems to use this proportionality of justice in his *Republic*.[79] For the farmer, he says, produces food, the builder a house, the weaver a cloak, and the shoemaker a shoe. The farmer then gives the builder food, and the builder gives the farmer a house; and, in the same way, all the others are so related that they exchange their products for those of the others. **11.** And the proportion is this: as the farmer [gives] to the builder, so the builder gives to the farmer. Likewise, for the shoemaker, the weaver, and for all the others, the same proportion in relation to each other applies. And this proportion holds the constitution together. So the just seems to be the proportional. For the just holds constitutions together, and the just is the same as the proportional. **12.** But since the builder makes his own work worth more than the shoemaker does, and it was possible for the shoemaker to exchange his work with the builder, but not possible to get a house in return for a pair of shoes, it was in fact at that time that they introduced the convention (*enomisan*) of using something with which all these things can be bought, namely, silver, which they called "money" (*nomisma*), and of making their exchanges with each other by each giving for each work its worth [in silver]. And this[80] holds the constitution together.

13. Since, then, the just is found in these things and in what was mentioned before, the justice that is concerned with these would be a state[81] having an impulse, accompanied by deliberate choice, concerning these things and found in these.

Reciprocity is also just, but not in the way the Pythagoreans said. For they thought it just for a person to suffer in return the things that he did. But this sort of thing is not possible in relation to everyone. **14.** For justice for servant in relation to free person is not the same [in terms of suffering in return the things that one did]. For if the servant strikes the free person a blow, it is not just that he be struck a blow in return, but rather many blows. For the reciprocally just too lies in proportionality. For as the free person, by being better, is related to the slave, so what is done in return is related to what is done. It is the same way too for free in relation to free. For it is not just,[82] if someone has knocked out someone's eye, that he only have an eye knocked out in return, but that he suffer more, following along with what is proportional. For in fact he started things and committed an injustice, and so was doubly unjust. So

79. 369d–370a.
80. Reading τοῦτο.
81. Reading τις ἕξις.
82. Reading δίκαιον.

in proportion to the injustices in fact committed, his having more done to him than he did is just. **1194ᵇ1**

15. But since things are said to be just in many ways, we must determine what sort of justice our investigation concerns.

There is, then, a sort of justice, as they say, for servant in relation to master and son in relation to father. But the just in these cases would seem to have only a name in common with the politically just (for it—the politically just—is the just that our investigation is about). **16.** For it is found most of all in equality (for citizens[83] are partners of a certain sort, and tend to be equal by nature, though their modes [of life] are distinct), but in the case of son in relation to father, and servant in relation to master, there would not seem to be any element of the just. For neither is there any element of the just in the case of my foot or my hand in relation to me, nor likewise in the case of each of the other parts. Son[84] in relation to father would seem, then, to be the same way as well. For the son is like a sort of part of his father. Except that when he has already attained the position of a man and has been separated from him, then at that point he is in a relation of equality and similarity to his father; and citizens wish to be like this in certain ways. **17.** And in the same way, due to the same cause, there is also no element of the just in the case of slave in relation to master; for the slave is a sort of [part] of his master.[85] If there is an element of the just in relation to him, it is of the just suited to the household. But this, at any rate, is not what we are seeking, but rather the political sort. For the politically just would seem to lie in equality and likeness.

18. The just that is found in the community of wife and husband is close to the politically just. For while the wife is inferior to the husband, yet she is more of an intimate [than the others], and in a way shares more in equality. That is why their life is closer to one of political community. So too the just in the case of the wife in relation to the husband is in a way already more political than any of the others.

19. Since, then, the just is what is found in the political community, both[86] justice and the just person will be concerned with the politically just.

Among just things, some are by nature, others by law. But one must not suppose them to be so in such a way that they could never change to something else. For even the things that are by nature participate in change. **20.** I mean, for example, that if all of us always practiced throwing with the left hand, we would become ambidextrous. Yet by nature the left hand *is* the left hand, and things on the right are nonetheless by nature better than those on the left, even if we do everything with the left just as we do with the right. Nor because these things change to something else is it the case that, because of it, they are not so by nature. But if for the most part and the longer time the left remains in the present way left, and the right right, then this is so

83. Reading πολιτικοί.
84. Omitting ὁ.
85. *Pol.* 1254ᵃ11–13.
86. Reading καὶ.

by nature. **21.** It is the same way in the case of things that are just by nature: if they
1195a1 change because of our use, it is not the case that, because of this, there is nothing that is by nature just—there is. For what remains so for the most part is plainly just by nature. For what we set up and enact (*nomisômen*) is at that point just, and we call it "just" in accord with law (*nomos*). Just in accord with nature is better, then, than just in accord with law. But what we are seeking is the just that is political. And the political one is so by law, not by nature.

22. The unjust and the unjust action might thus seem to be the same, but they are not. For the unjust is what has been determined by law (for example, it is unjust to take what has been entrusted to one's care), while the unjust action is the actual doing of something unjustly. Similarly, the just and the just action are not the same. For the just is what has been determined by law, while the just action is the doing of just things.

23. When, then, is there the just [realized], and when not? Simply speaking, when one does an action in accord with deliberate choice and voluntarily (what the voluntary is was stated by us above[87]), and when knowing whom one does it to, with what, and for the sake of what, one in this way does something just. Similarly too, and in the same way, the unjust person will be the one knowing whom, with what, and for the sake of what. But when, without knowing any of these things, one does something unjust, one is not unjust, but unlucky. For if someone has killed his father thinking that he is killing the enemy, though he has done something unjust, yet he is not being unjust at all,[88] but is unlucky.

24. Not being unjust, then, when one does unjust things lies in ignorance. That is,[89] as was also stated a little bit above, when the agent does not know whom he is harming, with what, or for the sake of what. But we must also define the ignorance, and say how the ignorance must arise if he is not going to be unjust to the person he harms. **25.** Let the following, then, be the definition: when the ignorance is the cause of his doing something, he does not do it voluntarily. So he is not doing something unjust. But when he is himself the cause of the ignorance, and acts[90] in accord with the ignorance of which he is himself the cause, he is then doing something unjust, and such a person will be rightly called "unjust." For example, in the case of people who are drunk. For those who are drunk and do something bad are doing something unjust; for they are themselves the cause of [their] ignorance. For it was possible for them not to have drunk[91] so much that they struck their father in ignorance. **26.** It is the same way in other cases of ignorance that arise because of the agents themselves; those who do injustice in accord with them are unjust. But where they are not themselves the causes, but their ignorance is the cause of their doing the actions they do,

87. 1.12–16.
88. Reading οὐθέν.
89. Reading ἔστιν οὖν . . . ἐστι τοῦτο.
90. Omitting τι.
91. Reading πιεῖν.

they are not unjust. This sort of ignorance is natural—for example, children strike their fathers in ignorance. But the ignorance that is in them, since it is natural, does **1195^{b}1** not make the children be called "unjust" because of their action. For the ignorance is the cause of their doing it, and they are not themselves causes of the ignorance, which is why they are not said to be unjust either.

27. How is it, then, as regards suffering injustice? Is it possible to suffer injustice voluntarily? Surely not! For while we do just and unjust things voluntarily, when we 5 suffer injustice it is no longer voluntary. For we avoid being punished, so it is clear that our suffering injustice would not be voluntary. For no one voluntarily endures being harmed; for to suffer injustice is to be harmed.

28. Yes, but there are some people who, when they should have what is equal, give way to others. So if, as we saw,[92] to have what is equal is just, and to have less is to 10 suffer injustice, and a person voluntarily has less, it follows, [the argument] says, that he suffers injustice voluntarily. But from the following, on the other hand, it is clear that it is not voluntary. For all who get less receive some compensation, either honor, praise, glory, friendship, or something else of this sort. But the one who receives some 15 compensation in return for what he gives up no longer suffers injustice. But if he does not suffer injustice, then he does not suffer it voluntarily either.

29. Again, further, those who get less and suffer injustice by not getting what is equal show off and pride themselves for such things, because they say: although it was open to me to take an equal share, I did not take it, but gave way to the elder, or 20 to a friend. But no one prides himself for suffering injustice. But if they do not pride themselves for suffering unjust actions and do pride themselves for these things, they would not suffer injustice at all in taking less in this way. But if they do not suffer injustice, they do not suffer injustice voluntarily either.

30. To these and these sorts of arguments, however, the argument from the case of the person who lacks self-control stands contrary. For the person who lacks 25 self-control harms himself by doing base things, and these, at least, he does voluntarily. Therefore, he harms himself knowingly. So he suffers injustice due to himself voluntarily. But a statement of the limits of possibility prevents this argument when added here. The statement of the limits of possibility is this: no one wishes to suffer 30 injustice. But the person who lacks self-control[93] wishes to do the things that are in accord with his lack of self-control, so that he does injustice to himself. Therefore, he wishes to do base things to himself. But no one wishes to suffer injustice. So even the person who lacks self-control would not be voluntarily doing injustice to himself.

31. But perhaps someone might here again be puzzled: Is it really possible for a 35 person to do injustice to himself? To someone investigating the matter from the perspective of the person who lacks self-control it would certainly seem to be possible. As, again, from the following way of looking at it. For if the things the law prescribes

92. 1.33.4–9.
93. Omitting γε.

doing are just, the person who does not do them does injustice. And if he does not do
1196a1 them to the person the law orders him to do them to, he does injustice to that person. But the law orders one to be temperate, acquire property, take care of one's body, and other things of this sort. Therefore, the person who does not do these things, does injustice to himself. For there is no one else to refer such unjust actions to.

32. But such things,[94] as we saw,[95] can hardly be true, nor is it possible for a person to do injustice to himself. For it is not possible for the same person at the same time to have more and less, nor to act voluntarily and involuntarily at the same time. But the person who does injustice, insofar as he does injustice, has more, and the person who suffers injustice, insofar as he suffers injustice, has less. Therefore, if he does injustice to himself, it is possible for the same person to have more and less at the same time. But this is impossible. Therefore, it is not possible for a person to do injustice to himself.

33. Further, the one who does injustice does injustice voluntarily, while the one who suffers injustice suffers injustice involuntarily. So if it is possible for a person to do injustice to himself, it would be possible to do something involuntarily and voluntarily at the same time. But this is impossible. Therefore, from this way of looking at it too, it is not possible for a person to do injustice to himself.

34. Further, suppose one were to take hold of the issue on the basis of particular unjust actions. For everyone does injustice either by taking what was entrusted to his care, committing adultery, stealing, or doing some other particular unjust action. But no one has ever taken what he entrusted to his own care, committed adultery with his own wife, or stolen his own property. So if doing injustice is found in these sorts of things, and it is not possible to do any of them to oneself, it will not be possible to do injustice to oneself.

35. But if it is possible, it will, at any rate, be an act not of political but of household injustice. For the soul, since it is divided into several parts, has within itself one that is inferior and one that is superior, so that if there is any unjust action of what is in the soul, it would be[96] of the parts against each other. For we distinguished[97] the act of household injustice by its being directed against the inferior or the superior, and in this way one can be unjust or just to oneself. But it is not this that we are investigating, but the political sort. **36.** So in the case of such acts of injustice as we are inquiring into, it is not possible for one to do injustice to oneself.

Again, which of the two does injustice, and in which is the unjust action found, when a person unjustly possesses anything whatsoever? Is it not found in the one who judges and makes the award, as in the games? For the one who receives the palm of victory from the person presiding and judging these matters does no injustice even if it was awarded to him unjustly. Instead, it is the one who has judged badly and

94. Reading τὰ τοιαῦτα.
95. 1.33.27.
96. Deleting ἐστι.
97. Reading γὰρ. See 1194b5–29.

given it who does injustice. And while he is in a way doing injustice, in a way he is not doing injustice. For insofar as he has not judged [in accord with] what is in truth **1196^{b}1** and by nature just, he is doing an injustice, while insofar as he has judged [in accord with] what seems just to him, he is not doing an injustice.

1.34
The Virtues of Thought

1. We have spoken about the virtues, saying what they are, in what they are found, and what sorts of things they are concerned with, and about each of them in particular, that if we act in accord with correct reason[98] the best thing [would come about]. But to speak in this way, saying "to act in accord with correct reason," is like saying that health would come about best if one administered healthy things. For such a statement is not perspicuous. And someone will say, "explain perspicuously to me what sorts of things are healthy." **2.** So too in the case of reason, what is reason and what correct reason?

Perhaps it is necessary first to divide what reason arises in. **3.** A distinction having to do with the soul was drawn in outline previously,[99] that there is one part of it that has reason, while the other is non-rational.[100] But the one part of the soul that has reason[101] admits of a twofold division, of which one is the deliberative part, the other the scientific part. And that these are distinct from each other may be made evident from their underlying subjects. **4.** For as color, flavor, sound, and odor are distinct from each other, so nature has in like manner assigned them distinct perceptual modalities as well. For we cognize sound by hearing, flavor by taste, color by sight. Similarly, we must suppose that the others are also the same way. But since[102] the underlying subjects are distinct, the parts of the soul by which we cognize them must be distinct too. **5.** For the intelligible and the perceptible are distinct; and these we cognize by soul. Therefore, the part concerned with perceptible objects and the part concerned with intelligible ones would be distinct. But the deliberative and deliberately choosing part is concerned with perceptible objects, those in movement, and, in general, with what comes to be and passes away. **6.** For we deliberate about things that are up to us to do or not to do in action and to deliberately choose them. And whatever there is[103] deliberation about and deliberate choice as to whether to do or not do them, are perceptible objects that are in movement and changing. So the deliberately choosing part of the soul is, in accord with this argument, concerned with perceptible objects.

98. Not in fact mentioned previously.
99. 1185^{b}1–12.
100. Omitting μόριον τῆς ψυχῆς.
101. Reading τὸ ἓν λόγον ἔχον μόριον.
102. Reading ἐπεὶ δ'.
103. Reading δ'ἐστιν.

7. Having drawn these distinctions, the next thing we must speak about—since reason is concerned with truth, and we are investigating in what way it possesses the truth—is scientific knowledge, practical wisdom, understanding, theoretical wisdom, and supposition, and what each of them is concerned with.

8. Scientific knowledge, then, is concerned with the scientifically knowable, and this is arrived at with the involvement of demonstration and reason, while practical wisdom is concerned with things doable in action, in which there is choice and avoidance, and it is up to us to do them or not to do them.

9. Of the things produced and of the things doable in action, the productive and the practical[104] are not the same. For of the ones that are productive there is some end beyond the process of production—for example, beyond building, since it is productive of a house, a house is its end beyond the process of production, and it is the same way in the case of carpentry and the other productive ones. **10.** But in the case of the practical ones, there is no other end beyond the action itself—for example, beyond playing the lyre there is no other end, but this itself is the end, that is, the activity and the action. Practical wisdom, then, is concerned with action and with things doable in action, while craft is concerned with production and things produced; for it is in things produced rather than in things doable in action that craft is employed.

11. So practical wisdom would be a sort of deliberately choosing and practical state concerned with all the things that it is up to us to do or not to do in action that in fact lead to what is advantageous.

12. Practical wisdom would seem to be a virtue, not a science. For the practically wise are praiseworthy, and praise is for virtue. Further, there is a virtue of every science, while of practical wisdom there is no virtue; on the contrary, it seems to be a sort of virtue itself.

13. Understanding is concerned with the starting-points of intelligible objects and of the beings; for scientific knowledge is of things that involve demonstration, but the starting-points are indemonstrable, so that scientific knowledge would not be concerned with the starting-points, but rather understanding would.

14. Theoretical wisdom is composed of scientific knowledge and understanding. For theoretical wisdom is concerned both with the starting-points and with what is then proved from the starting-points, which is what scientific knowledge is concerned with. Insofar, then, as it is concerned with the starting-points, it shares in understanding, but insofar as it deals with things involving demonstration that come after the starting-points, it[105] shares in scientific knowledge. So it is clear that theoretical wisdom is composed both of understanding and of scientific knowledge, so that it would be concerned with those things[106] that both understanding and scientific knowledge are concerned with.

104. I.e., a doer of action. See 1.34.28.
105. Reading αὕτη.
106. Reading ταῦτα.

15. Supposition is that by which we play a double game with everything, as to whether it is so or not so.

16. Are practical wisdom and theoretical wisdom the same thing? Surely not! For theoretical wisdom is concerned with things that involve demonstration[107] and are always the same way, while practical wisdom is concerned not with these, but with things that undergo change. I mean, for example, that straight, curved, concave, and things of this sort are always such, while advantageous things are no longer this way by[108] not changing into each other.[109] On the contrary, they do change, and a given thing is advantageous now, but tomorrow not, and to this person but not to that one, and is advantageous in this way but not advantageous in that one. Practical wisdom is concerned with advantageous things, but theoretical wisdom is not. Therefore, **1197^{b}1** theoretical wisdom and practical wisdom are distinct.

17. Is theoretical wisdom a virtue or not? From the following considerations,[110] based on practical wisdom itself, it will be clear that it is a virtue. For if practical wisdom is a virtue, as we say, of one of the two parts of the soul that have reason, and practical wisdom is inferior to theoretical wisdom (for it is concerned with inferior things; for theoretical wisdom is concerned with the eternal and divine, as we say, practical wisdom with what is advantageous to a human being)—if, then, the inferior is a virtue, it is fitting for what is superior, at any rate, to be a virtue; so it is clear that theoretical wisdom is a virtue.

18. What is comprehension and what is it concerned with? Comprehension is found where practical wisdom is also found, namely, concerning things doable in action. For the person of comprehension is, I suppose, said to be such due to his capacity to deliberate, and in that he judges and sees something correctly. But his judgment concerns unimportant things and in unimportant situations. Comprehension and being a person of comprehension, then, are part of practical wisdom and the practically wise person, and cannot be found without them; for one cannot separate the person of comprehension from the practically wise person.

19. What holds in the case of cleverness would seem to be similar. For cleverness and the clever person are not practical wisdom and the practically wise person, but the practically wise person is certainly clever, which is why indeed cleverness in a way works together with practical wisdom. **20.** But the base person is also said to be clever—for example, Mentor seemed to be clever, but he was not practically wise. For it is characteristic of a practically wise person and practical wisdom to seek the best things and to be always a deliberate-chooser and a doer in action of these, while it is characteristic of cleverness and the clever person to investigate what each of the things doable in action will come about from, and to provide these. The clever person, then, would seem to be found engaged in these sorts of things and concerned with these.

107. I.e., by leading to them.
108. Reading τῷ.
109. Reading ἄλληλα.
110. Reading διὰ τούτων.

21. But someone might raise a puzzle and wonder why in a study of characters and a sort of politics we are speaking about theoretical wisdom. Presumably, it is because, in the first place, the investigation of it would not even seem to be an alien one, if indeed, as we claim, theoretical wisdom is a virtue. Further, presumably it is characteristic of the philosopher, where these matters are concerned as well, to investigate also whatever happens to be found in the same thing. **22.** And it is necessary, when we are speaking about the things in the soul, to speak about[111] all of them. But theoretical wisdom is also in the soul. So we are not proceeding in an alien way in producing our accounts of it.[112]

23. As cleverness stands to practical wisdom so something would seem to stand in the case of all the virtues [of character]. I mean, for example, that there are virtues that arise also by nature in each individual, for example, in each one there are certain impulses, which are without reason, toward courageous things, just things, or the things that are in accord with a particular virtue; **24.** but there are also virtues due to habit and deliberate choice. The ones, then, that involve reason, since they are virtues in the complete sense, are praiseworthy when they supervene [on action]. But this natural virtue, which is without reason, when it is separated from reason is a small thing, and falls short of being praised, but when it is added to reason and deliberate choice it makes virtue complete. That is also why the natural impulse to virtue works together with reason and [in that way] does not exist without reason.

25. On the other hand,[113] reason and deliberate choice are also not fully complete in relation to being virtue, without natural impulse. That is why Socrates was not speaking correctly in saying that virtue is reason. For doing courageous things and just things is of no benefit, he thought, unless one knows and deliberately chooses them by reason. That is why he said, not correctly, that virtue is reason. But people nowadays do better. For they say that it is doing noble things in accord with correct reason that is virtue. **26.** But even this[114] is not correct. For someone might have done what is just correctly and in accord with correct reason (I mean having done it as correct reason would order) without any deliberate choice at all, or knowing what is noble, but from a non-rational impulse.[115] Nonetheless, this sort of action does not have what is praiseworthy. Instead, the way we define it is better, namely, that the impulse toward the good involves reason. For something of this sort is in fact virtue and is praiseworthy.

27. But someone might raise a puzzle as to whether or not practical wisdom is a virtue. Nonetheless, that it is a virtue may be made clear from the following consideration. For if indeed justice, and courage, and the other virtues, because they involve doing noble things, are[116] praiseworthy, it is clear that practical wisdom too would be

111. Reading ὑπὲρ.
112. Reading αὐτῆς.
113. Reading ὁ δ᾽αὖ.
114. Reading οὕτως.
115. Reading ὁρμῇ.
116. Omitting καὶ.

among the things that are praiseworthy and rank as virtues. For what courage impels us to do, practical wisdom impels us to do as well. For, in general, as it prescribes, this way courage also acts, so that if it is praiseworthy for doing what practical wisdom prescribes, practical wisdom would be a completely praiseworthy virtue.[117]

28. But whether practical wisdom is [genuinely] practical[118] or not one may see from the following, by looking at the sciences—for example, at building. For in building, as we say, there is the one called the "architectonic craftsman," and another, who assists him, the builder; and he is productive of a house. But the architectonic craftsman, to the extent that he has produced a house, is also productive of a house. It is the same way in the case of all the productive sciences in which there is an architectonic craftsman and his assistant. Therefore, the architectonic craftsman will be productive of the very same thing as his assistant.[119] **29.** If, then, it is similar in **1198^{b}1** the case of the virtues as well, as is precisely fitting and reasonable, practical wisdom would also be practical. For all the virtues are practical, and practical wisdom is a sort of architectonic craftsman of them. For as it prescribes, so the virtues, and the people who [live] in accord with them, do in action. Since, then, the virtues are practical, practical wisdom would also be practical.

30. But does it rule over everything in the soul, as it seems to and is puzzling? Surely not! For it would not seem to do so over what is superior to itself—for example, it does not rule over theoretical wisdom. But, [the puzzled one] says, it supervises everything, and is in control of issuing prescriptions.

31. But presumably it has the same position as the steward in the household. For he is in control of everything and manages everything, yet he does not at all rule over everything, but rather provides leisure for the master, in order that he may not be hindered by the necessities [of life] and prevented from doing something that is noble and fitting. **32.** So too, and in a similar way to this, practical wisdom is, as it were, a sort of steward of theoretical wisdom, and provides leisure for it and for the doing of its work, by restraining the feelings and making them temperate.

BOOK 2

2.1
Decency

1. After this we should make an investigation of decency—what it is, what it is found in, and what sorts of things it is concerned with. Decency and the decent person tend to mitigate the things that are just in accord with law. For where the legislator

117. Omitting καὶ$_1$ and καὶ$_2$.
118. 1.34.8.
119. Reading ὑπηρέτης.

is incapable of determining the particulars exactly, but speaks in universal terms, the person who in these cases gives way, and chooses those things that the legislator would have wished[120] by determining the particulars, but was unable to, such a person is decent. But he does not tend to mitigate the things that are unconditionally just. For he does not tend to mitigate the things that are by nature truly just, but of things that are just in accord with law, ones that the legislator, from inability, left out.

2.2
Consideration

1. Consideration and the considerate person are concerned with the same things as decency (that is, the just things left aside by the legislator by not being defined exactly). He is able to judge the things left out by the legislator, knowing that they have been left out by the legislator, even though they are just. Such a person is considerate. Consideration, then, does not exist without decency; for it is characteristic of the considerate person to judge, but then[121] of the decent one to act and[122] act in accord with the judgment.

2.3
Good Deliberation; Puzzles about Justice and Practical Wisdom

1. Good deliberation is concerned with the same things as practical wisdom (for it is concerned with things doable in action that concern choice and avoidance), and does not exist without practical wisdom. For practical wisdom involves doing these things in action, while good deliberation is a state, disposition, or something of this sort, that is capable of attaining the best and most advantageous in what is doable in action. **2.** That is why the things that are the objects of good deliberation would not seem to be the sort of things that turn out appropriately by luck. For where there is no reason that is looking for the best, you would no longer say that a person for whom something turned out appropriately had deliberated well, but that he has good luck. For accomplishments that occur without the judgment of reason are cases of good luck.

3. In social intercourse, is it characteristic of the just person to give to each person equally (I mean, for example, of whatever sort the particular person is, this is the sort he becomes on meeting him)? Surely not! For this would seem to be characteristic of a flatterer and an ingratiator. But to assign what is in accord with his worth to each, this would seem to be characteristic of the unconditionally just and excellent person.

120. Omitting τῷ.
121. Reading τὸ δ᾽ἥδη.
122. Retaining καὶ.

4. But someone might also raise this puzzle: if indeed doing injustice is harming voluntarily, knowing whom, how, and for the sake of what, and if harm and injustice are found in and concern good things, then the doer of injustice and the unjust person would know what sort of things are good and what sorts are bad. But to know about these things is special to the practically wise person and to practical wisdom. The absurdity then results that with the unjust person there follows along the greatest good, practical wisdom.

5. Or would practical wisdom not seem to follow along with the unjust person? For the unjust person does not investigate, nor is he capable of judging, what is unconditionally good and what is good for him, but makes errors. **6.** But it is characteristic of practical wisdom to be capable of getting a correct theoretical grasp on these things. It is just like the case of matters of medicine where we may all know what is unconditionally healthy and productive of health—that hellebore, a laxative, surgery, and cautery are healthy and productive of health—but nonetheless we do not possess the science of medicine. For we do not know yet what is good in a particular case, in the way the doctor knows for whom a given thing is good and when and being in what condition; for it is in fact in this that the science of medicine is found. We know what is unconditionally healthy; nonetheless we do not possess the science of medicine, nor is it something that follows along with us.

7. The unjust person is the same way. He knows that[123] ruling office and authority **1199b1** are unconditionally good; but whether they are good for him or not, or when, or to him being in what condition, he does not know yet. But this above all is characteristic of practical wisdom. So practical wisdom does not follow along with the unjust person. For the good thing he chooses, and which he does injustice for, are what are unconditionally good, yet not, presumably, good for him. For wealth and ruling office are unconditionally good but, nevertheless, presumably not good for him. For equipped with prosperity and ruling he will do much evil to himself and his friends. For he will not be capable of using ruling office correctly.

8. But this too contains a puzzle and an investigation as to whether injustice toward a base person is possible or not. For if injustice consists in harm, and harm in the deprivation of goods, injustice would seem not to harm [the base person]. For the goods he thinks to be good for him are not good. For ruling office and wealth will harm the base person, who is not capable of using them correctly. If, then, they will harm him by their presence, the one who deprives him of them would not seem to be doing an injustice. **9.** This sort of argument would indeed seem unacceptable to ordinary people. For all think that they are capable of using ruling office, power, and wealth, but their supposition is incorrect. **10.** This is clear from the legislator as well. For the legislator does not entrust ruling office to everyone, but an age and property are determined that must be possessed by anyone who is going to rule, on the supposition that ruling is not possible for everyone. If, then, someone were to be

123. Omitting καὶ ἡ τυραννὶς ("tyranny").

annoyed that he was not ruling, or that no one allowed him to govern, one might reply, "Because you have nothing in your soul of the sort that would make you capable of ruling and governing." **11.** In the case of the body, we see that people cannot be healthy by administering things that are unconditionally good to themselves. Instead, if someone is going to make his bad body healthy, he must first administer water to it and a small quantity of food. And when someone has a bad soul, in order that he may not do any evil, he must[124] refrain from wealth, ruling office, power, and such things generally, doing so more to the extent that a soul is more easily moved and more easily changed than a body. For just as being moderate was suitable for the person who is base regarding the body,[125] so living without having any things of this sort is suitable for the person with a bad soul.

12. There is also another sort of puzzle: When it is not possible to do what is courageous and what is just at the same time, which should one do? In the case of the natural virtues, we said that the impulse alone toward the noble without reason **1200a1** needs[126] to be present. But when there is choice, it is present in reason and in the part that has reason. So at the same time as choice is present, complete virtue will also be present, which we said[127] involves practical wisdom, though not without the natural impulse toward the noble. **13.** Nor will virtue be contrary to virtue. For it naturally yields to reason, and the way it prescribes, so that the things reason leads to, to these it inclines. For reason is the chooser of what is better. For the other virtues do not come about without practical wisdom, nor is practical wisdom complete without the other virtues, but they work together with each other in a way by following along with practical wisdom.

14. But things of this sort will also raise no less a puzzle, whether it is ever the case with virtues as it is the case with other goods, both external and concerned with the body. For when these run to excess they make people worse—for example, when wealth becomes great it makes people haughty and unpleasant. It is the same way in the case of the other goods—ruling office, honor, beauty, stature. **15.** Is it this way, then, in the case of virtue too, so that if someone has justice or courage to excess he will be worse? "Surely not," he says. But from[128] virtue comes honor, and when honor becomes great, it makes people worse. "So it is clear," he says, "that virtue, by advancing to a growth in magnitude, makes people worse; but[129] of honor virtue is the cause, so that virtue also, if it becomes great, will make people worse." **16.** But surely this is not true. For if there are also many other works that virtue has, as in fact there are, among the most important of them is being capable of using these and these sorts of goods correctly, when they come. If, then, the excellent person, when

129. Reading δὲ.

great honor or high ruling office comes to him, will not use them correctly, he would no longer be excellent. Neither honor, then, nor ruling office will make the excellent person worse, so neither will virtue.

17. In general, since it was determined by us at the start[130] that virtues are mean states, it follows that the more a state is a virtue, the more it is a mean. So it is not the case that as a virtue goes toward greatness it will make someone worse; on the contrary, it will make him better. For the mean state, we saw, is a mean state between deficiency and excess in feelings.

2.4
Self-Control and Lack of Self-Control

1. So much, then, for these matters. After this it is necessary for us to make another start and speak about self-control and lack of self-control. **2.** But just as, to the extent that they are virtue and vice,[131] these are strange, in like manner it is necessary for the accounts we give of them to be strange too. For this virtue is not like the others. For in the others reason and feelings have an impulse toward the same things and **$1200^{b}1$** are not contrary to each other, while in this virtue reason and feelings are contrary to each other.

3. There are three things in the soul in virtue of which we are said to be base: vice, lack of self-control, and beastliness. About vice and virtue, then, what they are and in what they are found, we have spoken above. But now we must speak about lack of self-control and beastliness.

2.5
Beastliness

1. Beastliness is a sort of excessive vice. For when we see someone who is entirely base, we say that he is not even a human being, but a beast, implying that beastliness is a sort of vice. **2.** The virtue that is opposed to it is nameless, but it is of a sort that is beyond human, like a sort of heroic or divine virtue. But this virtue is nameless because there is no virtue[132] that belongs to a god. For the god is something superior[133] to virtue and it is not in accord with virtue that he is excellent. For, if there were, virtue would be superior to the god. **3.** That is why the virtue opposed to the vice of beastliness is nameless. But what is customarily opposed to this sort of vice is divine

133. Reading βέλτιον.

and beyond-human virtue; for just as the vice of beastliness is beyond human, so is the opposing virtue.

2.6
Puzzles Concerning Self-Control and Lack of Self-Control

1. With regard to lack of self-control and self-control, we should first state the puzzles and the arguments that are contrary to what appears to be the case, in order that, having considered them together on the basis of the puzzles and the contrary arguments, and having examined these, we may as far as possible see the truth about them. For, in this way, it will be easier to see what is true.

2. Socrates the elder used to do away with lack of self-control altogether and claim that it did not exist,[134] saying that no one would choose bad things knowing that they are bad. But the person who lacks self-control seems, while knowing things to be base, to choose them nonetheless, being led by feelings. Due, then, to this sort of argument Socrates did not think that there is lack of self-control; but not correctly.

3. For it is absurd, convinced by this argument, to do away with what we are persuaded occurs; for there are human beings who lack self-control, and these, knowing that the things are base, nonetheless do them.

4. Since lack of self-control exists, then, does the person who lacks self-control have some sort of scientific knowledge by which he gets a theoretical grasp on and examines the base things? But, again, this would seem not to be the case. Again, however, it would be absurd for[135] the strongest and most secure thing in us to be defeated by anything. For scientific knowledge is the most stable and forceful thing in us. So this argument, again, is contrary to its being[136] by scientific knowledge [that he gets a theoretical grasp on the base things].

5. But though not scientific knowledge, is it belief, at least? But if the person who lacks self-control has belief, he would not be blameworthy. For if he does something base having not exact knowledge but belief, one would give sympathetic consideration to his having sided with pleasure and done base things, since he did not have exact knowledge that they were base, but belief. And those for whom we have sympathetic consideration, we do not blame. So the person who lacks self-control, if indeed he has belief, will not be blameworthy. But he is blameworthy.

6. Arguments of this sort, then, produce puzzlement. For some said that it is not scientific knowledge, for an absurdity results; others again said that it is not belief either, for they too produced an absurd result.[137]

134. *Protagoras* 352a–359a.
135. Reading ἀλλὰ πάλιν ἄν δόξειεν ἄτοπον.
136. Deleting μὴ.
137. Reading συμβαίνειν . . . ἐποίουν συμβαίνειν.

7. Someone might also raise the following puzzle: Since the temperate person seems also to be self-controlled, is there anything that will produce excessive appetites in the temperate one? If he is to be self-controlled, he must have excessive appetites; for one would not say that a person who is in control of moderate appetites is self-controlled. But if he is not[138] to have excessive appetites, he will no longer be temperate; for the temperate person is not[139] the one who does not have an appetite or feel anything at all.

8. The following sorts of things also again involve puzzles: it follows from the arguments that even the person who lacks self-control is sometimes praiseworthy and the self-controlled one blameworthy. For let it be the case, [the argument] says, that someone has made an error in his rational calculation, and let him, due to his rational calculation, believe that the noble things are base, but let his appetite lead him toward the noble ones. His reason, then, will not permit him to do them, but, since he is led by his appetite, he will do[140] them. {For the person who lacks self-control, as we saw, is of this sort. Therefore, he will do the noble ones; for let appetite lead him toward these. But reason will be preventing him; for let him make an error in his rational calculation about the noble ones.}[141] This person, then, though lacking self-control, will however be praiseworthy; for insofar as he does noble things, he is praiseworthy. But this result is absurd.

9. Again, on the other side, let him make an error in reason, and let the noble things seem to him not to be noble, but let his appetite lead him toward the noble ones. But a self-controlled person is the one who, though having an appetite to do something, does not do it, because of reason. The one who makes an error in reason about the noble things, then, will prevent [himself] from doing what he has an appetite for. Therefore, he will prevent [himself] from doing the noble things (for it was toward these that his appetite was leading him). But the person who does not do the noble things that he should do is blameworthy. Therefore, the self-controlled person will sometimes be blameworthy. But this result is also absurd.

10. And someone might also raise a puzzle as to whether lack of self-control and the person who lacks self-control are found in everything and concerning everything, for example, wealth, honor, anger, and reputation (for concerning all these there seem to be people who lack self-control), or not so, but rather lack of self-control is concerned with something definite.

11. These, then, are the things that present a puzzle; but it is necessary to resolve **1201^{b}1**
the puzzles. First, then, the case of scientific knowledge; for it seemed absurd for someone who has scientific knowledge to throw it away or fall away from it.
12. The same argument applies to belief as well; for it makes no difference whether it is belief or scientific knowledge. For if the belief will be very stable and immovable

138. Retaining μὴ.
139. Reading οὐ.
140. Reading πράξει.
141. Perhaps to be omitted as a marginal gloss.

by persuasion, it will be no different from scientific knowledge, in those who have beliefs, in[142] persuading them that things are as they believe—for example, Heraclitus of Ephesus has this sort of belief about what he believed.[143]

13. But there is nothing absurd in the person who lacks self-control doing something base, whether he has scientific knowledge or belief of the sort we are talking about. For knowing scientifically is twofold: one is possessing scientific knowledge (for we say that someone knows scientifically when he possesses scientific knowledge), while the other is actively using the scientific knowledge already possessed. The person, then, who possesses scientific knowledge of the noble things, but does not actively use it, lacks self-control. **14.** When he does not actively use this scientific knowledge, then, there is nothing absurd in his doing the base things while possessing the scientific knowledge. For it is like the case of people asleep. For they, though they possess scientific knowledge, nonetheless do and suffer many odious things in their sleep. For the scientific knowledge is not activated in them. It is likewise in the case of the person who lacks self-control. For he seems like one asleep, and does not actively use his scientific knowledge. **15.** In this way, then, the[144] puzzle is resolved. For the puzzle was whether the person who lacks self-control at the relevant time throws away his scientific knowledge or falls away from it. For both seemed to be absurd.[145]

But, again, it might be made evident in the following way; for as[146] we said in the *Analytics*[147] a syllogism is composed of two premises, and of these, the first is universal, while the second falls under it and is particular—for example,

> I scientifically know how to make anyone with a fever healthy,
> This person has a fever,
> Therefore, I scientifically know how to make this person healthy too.

It is possible, then, on the one hand, to scientifically know something with the universal scientific knowledge and, on the other, with the particular.[148] **16.** Error, then, can strike the person who possesses scientific knowledge here as well—for example, I scientifically know how to make anyone with a fever healthy, yet whether this person has a fever, I do not know. Similarly, in the case of the person who lacks self-control, then, the same error will occur. For it is possible for the person who lacks self-control to have the universal scientific knowledge that these sorts of things are base and harmful, yet not know that these things are base,[149] so that while possessing

142. Reading δόξας ἔχουσι τῷ.

147. Probably no reference to Aristotle's *Analytics* is indicated.
148. Omitting οὔ.
149. Omitting ἐπὶ μέρους.

scientific knowledge in this way he will make an error. For he has the universal scientific knowledge, but not the particular.

17. In this way too, then, nothing absurd will result in the case of the person who lacks self-control if, while possessing scientific knowledge, he does something base. For it is like the case of people who are drunk. For drunk people, when their drunken- **1202^{a}1**
ness has left them, are themselves again. Reason was not expelled from them, nor was scientific knowledge, but it was mastered by their drunkenness.[150] The person who lacks self-control is again in a similar situation.[151] For his feeling, having mastered it, 5
put his rational calculation to rest. But when the feeling, like the drunkenness, has left, he is himself again.

18. There was another argument[152] about lack of self-control that presented a puzzle, implying that the person who lacks self-control will sometimes be praiseworthy, and the self-controlled person blameworthy. But this is not the case. For the person who is deceived in his reason is neither self-controlled nor lacks self-control, but 10
rather the one who possesses correct reason judges the base and noble things by it, disobeys this reason, and lacks self-control, while the one who obeys it and is not led by his appetites is self-controlled. For if it seems to someone that it is not shameful to beat his father, and having an appetite to beat him, refrains from it, he is not 15
self-controlled. **19.** So, if in cases of this sort there is neither self-control nor lack of self-control, neither would the lack of self-control be praiseworthy, as it seemed, nor the self-control be blameworthy.

20. Among the various sorts of lack of self-control, some are morbid, others by nature. For example, the following sorts are morbid. For there are[153] people who 20
pluck out their hairs and chew on them.[154] If, then, someone masters this pleasure, he is not praiseworthy,[155] nor blameworthy if he fails to, or not *very*. Those by nature are, for example: they say that a son was once being tried in court for beating his father, and defended himself by saying, "Yes, indeed, and he beat his father," and was, of course, acquitted. For it seemed to the judges that his fault was natural. If, then, 25
someone [in a case like this] were to master [the impulse] to beat his father, he is not praiseworthy. **21.** It is not, then, these sorts of lack of self-control and self-control that we are seeking now, but those for which we are said to be unconditionally blameworthy or praiseworthy.

Of goods, some are external—for example, wealth, ruling office, honor, friends, 30
reputation; others necessary and concerned with the body—for example, touch and taste. He, then, who lacks self-control concerning these would seem to lack

150. Omitting ἀπαλλαγέντες . . . εἰσίν ("but when their drunkenness has left they are themselves again").
151. Omitting οὖν and retaining πάλιν.

154. Cf. *NE* 1148^{b}28–29.
155. Reading οὐκ . . . ἐπαινετός.

self-control unconditionally.[156] And the lack of self-control that we are seeking would seem in fact to be concerned with these.

22. For[157] the puzzle was[158] what exactly lack of self-control is concerned with. Concerning honor, then, a person would not seem to lack self-control unconditionally. For the person who lacks self-control concerning honor is praised in a way. For he is a sort of lover of honor. And, in general, when we say that someone lacks self-control in the case of such things, we do it with an addition—lacks self-control concerning honor, reputation, or anger. But to the one who unconditionally lacks self-control we do not add what it is concerning, on the supposition that in his case it is evident, without the addition, what it concerns. For it is with bodily pleasures and pains that the person who unconditionally lacks self-control is concerned.

23. It is clear from the following that lack of self-control is concerned with these things; for since the person who lacks self-control is blameworthy, his subject matters must be blameworthy too. But honor, reputation, ruling office, wealth, and the other things people are said to lack self-control concerning are not blameworthy, but the bodily pleasures are blameworthy. That is why the person[159] who is concerned with these more than one should be is quite reasonably said to lack self-control in the complete sense.

24. Since, among the so-called lacks of self-control concerned with other things, the one concerned with anger is very blameworthy, is it the one concerned with anger that is more blameworthy or the one concerned with pleasures? The lack of self-control concerned with anger is like those[160] who are eager to be of service. For they too, when the master says "give me," get carried away by their eagerness, and, before they hear what they should give, give something, and make an error in what they give; for often when they should give a book, they gave a pen. **25.** The person who lacks self-control concerning anger undergoes something[161] like this. For spirit, as soon as it hears it said that a person did injustice, is impelled to take revenge, no longer waiting to hear whether it should or should not do so, or not in so extreme a way.

26. This sort of impulse to anger, then, because of which[162] lack of self-control concerning anger appears to exist, is not very blameworthy, while the impulse toward pleasure is of course blameworthy. For it is different from the former in that reason turns it away from doing the action, but it nonetheless does it, contrary to reason. That is why it is more blameworthy than lack of self-control due to anger. For lack of self-control due to anger is [accompanied by] pain (for no one feels anger without being pained), while that due to appetite involves pleasure. That is why it is

159. Reading ὤν.
160. Omitting τῶν παίδων.
161. Reading τι ἔπαθε.
162. Reading ᾗ.

more blameworthy. For lack of self-control due to appetite seems to involve wanton aggression.

27. Are self-control and resilience the same thing? Surely not! For self-control is concerned with pleasures and the self-controlled person is the one who masters pleasures, while resilience is concerned with pains. For the resilient person is one who endures and withstands pains.

28. Again, lack of self-control and softness are not the same. For softness and the soft person cannot withstand pains—not all of them, but those that someone else would necessarily withstand, while the person who lacks self-control is incapable of withstanding pleasures, but is made soft and led by them.

29. Again, there is, on the other hand, a sort of person who is called "intemperate." Is the intemperate person, then, the same as the person who lacks self-control? Surely not! For the intemperate person is the sort of person who thinks that what he does is best and most advantageous for himself, and has[163] no reason going contrary to what appears pleasant to him. But the person who lacks self-control has a reason that opposes him [in his doing the things] that his appetite leads toward. **1203^{a}1**

30. Which is harder to cure,[164] the person who lacks self-control or the intemperate person? It would seem, then, to be the person who lacks self-control;[165] for the intemperate person is easier to cure; for if a reason were to appear in him teaching him that the things are base, he would no longer do them. In the person who lacks self-control, however, the reason is already present, and he does them nonetheless. So a person of this sort would seem to be incurable.

31. But which has the worse disposition, the one in whom no good at all is present, or the one in whom some good is present together with these bad [actions]? Surely, it is clear that it is the intemperate person, the more so to the extent that the more estimable thing is badly disposed. Therefore, the person who lacks self-control has his reason in good condition, since it is correct, while the intemperate person does not.

32. Further, the reason of each person is a starting-point. In the person who lacks self-control, then, the starting-point, which is the most estimable thing, is well disposed, while in the intemperate one it is badly disposed. So the intemperate person would be worse off than the one who lacks self-control.

33. Further, as[166] in the case of the vice of beastliness of which we spoke,[167] it is not in a beast that one sees it, but rather in a human being (for "beastliness" is a name for excessive vice). Why? Because of nothing other than the fact that there is no base starting-point in a beast. The starting-point is reason. Further,[168] which

167. 2.5.
168. Reading ἔτι.

could do more evil, a lion or Dionysius, Phalaris, Clearchus, Eumathes,[169] or some other depraved people of this sort?[170] Surely, it is clear that it is these people. For the presence of a base starting-point within contributes great [evils], but in the beast there is no starting-point at all. **34.** In the intemperate person, then, there is a base starting-point. For insofar as he does base things and reason assents to these, and it seems to him that he should do them, the starting-point present in him is [base, while in the person who lacks self-control the starting-point that] is present is healthy.[171] That is why the person who lacks self-control would seem to be better than the intemperate person.

35. There are two forms of lack of self-control. One is a sort of impetuosity and lack of forethought and comes about suddenly (for example, when we see a beautiful woman, we immediately feel something, and, due to the feeling, an impulse is produced toward doing something that perhaps we should not do), while the other is like a sort of weakness, but involving[172] reason that turns us away. The former would not seem to be very blameworthy; for this sort appears even in excellent people, in those that are warm and of a naturally good disposition, while the other appears in
1203b1 cold and passionate ones, and people of this sort are blameworthy. **36.** Further, it is possible, by anticipating by means of reason, to feel nothing: "a beautiful woman is coming; hence, one should restrain oneself." Anticipating, then, by a reason of this sort, the person who lacks self-control because of the suddenness of the appearance will not feel anything and will not do anything shameful. But the one who knows by reason that he should not, but gives in to pleasure and is made soft, this sort of person is more blameworthy. For the one who lacks self-control in this way would never become excellent,[173] and anticipating reason would not cure him. For it is the leader present within [the one who knows], which he does not at all obey; instead, he gives in to pleasure and is made soft and somehow utterly weak.

37. Let us now speak about the puzzle of whether the temperate person is self-controlled, which was raised above.[174] Yes, the temperate person is also self-controlled. For the self-controlled person is not only the one who, when he has appetites within him, restrains them due to reason, but is also the sort of person who, even though he does not have appetites within him, is such as to retrain them, if any did appear. **38.** A person is temperate when he has no base appetites and when his reason concerning the relevant things is correct.[175] So self-control will follow along with temperance, and the temperate person will be self-controlled, but not the self-controlled one temperate. For the temperate person is the one who does not feel [these appetites],

169. Reading ἢ Εὐμάθης.

174. 1201a9–16.
175. Omitting ὁ δ' ἐγκρατὴς . . . ὀρθόν.

while the self-controlled person is the one who does feel them, or is such as at least[176] to feel them, but masters them. But neither of these is the case with the temperate person. That is why the self-controlled person is not temperate.

39. But is the intemperate person one who lacks self-control, or the person who lacks self-control intemperate? Or does neither follow along with the other? For the person who lacks self-control is one in whom reason fights against his feelings, but the intemperate one is not someone of this sort, but one who at the same time as he is doing base things has his reason voting with him. The intemperate person, then, is not like the one who lacks self-control, nor is the one who lacks self-control like the intemperate person. **40.** Further, the intemperate person is worse than the one who lacks self-control. For what is natural is harder to cure than what results[177] from habit (for habit too seems to be strong because of this, namely, that it turns into nature). **41.** The intemperate person, then, is in himself the sort of person who is such as to be base by nature. It is because of this too, and stemming from this, that reason in him is base. But the person who lacks self-control is not this way. For it is not because he in himself is the sort of person he is that his reason is[178] excellent (for if he is by nature the sort of person who is such as the base person is, it must be base). **42.** Therefore, the person who lacks self-control seems to be base by habit, the intemperate person by nature. The intemperate one, then, is harder to cure. For one habit is knocked out by another, but nature is knocked out by nothing.

43. But since indeed the self-controlled person is some[179] sort of person who is such as to know and not be deceived in his reason, and since the practically wise person is the sort who gets a theoretical grasp on each thing by correct reason, is it possible for the practically wise person to be someone lacking self-control, or not? For someone might raise a puzzle in these terms. But if we attend closely to what was said before, the practically wise person will not be someone lacking self-control. For we said[180] that the practically wise person was not only the one in whom correct reason is present, but also the one who does what in accord with correct reason appears best. But if the practically wise person does what is best, he would not be someone who lacks self-control; instead, it is the clever person that is of this sort. **44.** For we distinguished above[181] between the clever person and the practically wise one as being distinct. For while they are concerned with the same things, the one involves doing the things one should, while the other does not involve doing them. It is possible, then, for the clever person to be someone who lacks self-control (for cleverness does not involve doing the things one should), but it is not possible for the practically wise person to be someone who lacks self-control.

2.7
Pleasure

1. Next we must speak about pleasure, since it is with happiness that our account is concerned, and everyone thinks that happiness is pleasure and living pleasantly, or, at any rate, not without pleasure. For even those who scorn pleasure, and do not think that pleasure should be counted among the goods, do at least add absence of pain, and absence of pain is at all events close to pleasure.

2. That is why pleasure must be spoken about, not only because other people think we should, but because it is necessary for us to speak about pleasure. For since our account is about happiness, and we have given a definition of happiness[182] and declare it to be an activity of virtue in a complete life, and virtue is concerned with pleasure and pain, it would be necessary to speak about pleasure, since happiness is not without pleasure.

3. First, then, let us mention the things certain people say who do not think that one should take pleasure as being included in a class of good. First, they say that pleasure is a coming to be, that a coming to be is something incomplete, and that what is good never occupies the place of the incomplete. Second, that there are some base pleasures, but what is good is never included in badness. Again, that pleasure appears in all [animals] (for it appears in the base person and the excellent one, and in beasts wild and domesticated), but what is good does not mix with base things and is not
1204b1 common to many.[183] Also, that pleasure is not best of all, but what is good is best of all.[184] Also, that it is an impediment to doing noble things, but what is preventative of noble things would not be a good.

4. First, then, we must speak against the first one, which is related to coming to be, and try to refute the argument through its not being true. For, in the first place, not all pleasure is a coming to be. For the pleasure from contemplating is not a coming to be, nor is that from hearing[185] or smelling. For it does not result from a lack, as in the case of the others—for example, those from eating and drinking. For these result from lack and excess, from the replenishment of a lack or the removal of an excess. That is why they seem to be a coming to be. **5.** But lack and excess are pain. There is pain, then, where there is a coming to be of pleasure. But in the case of seeing, hearing, and smelling there is no antecedent pain; for no one who takes pleasure in seeing or hearing feels an antecedent pain. **6.** In the same way, in the case of thought, it is possible to feel pleasure in contemplating something without feeling antecedent pain. So there would be a sort of pleasure that is not a coming to be. If, then, as the

182. 1184b22–1185a13.
183. An argument may be omitted here. See 2.7.26.
184. 2.7.27.
185. Rejecting the addition of ἰδεῖν καὶ.

argument of these people claims, pleasure is not a good because it is a coming to be, but there is a sort of pleasure that is not a coming to be, this one would be a good.

7. But, in general, no pleasure is a coming to be; for even those pleasures that result from eating and drinking are not comings to be;[186] instead, those who say that these pleasures are comings to be are making an error. For since the pleasure results when the taking in [of food or drink] occurs, they think that because of this it is a coming to be. But it is not. **8.** For since there is a part of the soul by which we feel pleasure, at the same time as we take in what we lack, this part of the soul, insofar as[187] it is active, also moves, and the movement and activity of it is a pleasure. Because, then, of this part of the soul's being active at the same time as the taking in, or because of the activity of it, they think that the pleasure is a coming to be, due to the taking in being visible, the part of the soul invisible. **9.** It is like thinking that a human being is a body, because the latter is perceptible, while the soul is not. But the[188] soul, at any rate, also exists. It is the same way too in this case; for there is a part of the soul by which we feel pleasure, which is active at the same time as the taking in. That is why no pleasure at all is a coming to be. —**10.** Also, it is, they say,[189] the perceptible restoration to a natural state. [But it is not.] For pleasure is possible even for those who are not being restored to a natural state. For restoration is the result of the replenishment of a natural lack, but it is possible, as we say, to feel pleasure without any lack. For the lack is pain, but we say that one feels pleasure without pain, that is, before [there is] pain. —So if it is because pleasure is a coming to be that it seemed not to be a good, and no pleasure is a coming to be, pleasure would be a good.

11. But next, they say that not every pleasure is a good. One might be able to see about this one too in the following way. For, since we say that good is said of things in all the categories (for it is said of things in substance, relative, quantity, time, and, in general, in all of them), this much is evident at once. For in accord with every activity of a good thing a sort of pleasure follows along, so that, since the good is present in all the categories, pleasure too would be.[190] So, since the good and pleasure are present in these, and pleasure is pleasure from goods, every pleasure would be a good.

12. At the same time, it is clear from this that pleasures differ in form. For the categories differ in which pleasure is found. For it is not as it is in the sciences—for example, grammar or any other science whatsoever. For if Lampros possesses the science of grammar, he[191] will be disposed, due to this science of grammar, in the same way as anyone else who possesses the science of grammar. That is why[192] there

192. Reading διὸ οὐκ.

are not two different sciences of grammar, the one in Lampros and the[193] one in Neleus.[194] But in the case of pleasure it is not like this. For the pleasure from drunkenness and the one from sexual intercourse do not dispose us in the same way. That is why pleasures would seem[195] to differ in form.

13. Because certain pleasures are in fact base, because of this too pleasure did not seem to these people to be a good. But this sort of point and this sort of judgment are not special to pleasure, but also apply to nature and scientific knowledge. For there is in fact a base nature too (for example, that of larvae, beetles, and, in general, animals that lack esteem), but nature is not a base thing because of this. **14.** Similarly, though there are base sciences (for example, the unrefined ones), nonetheless scientific knowledge is not a base thing because of this. On the contrary, both scientific knowledge and nature are good in kind. For just as one must get a theoretical grasp on what the quality of a sculptor is not from something he failed at and made badly, but from what he did well, in the same way one must not get a theoretical grasp on scientific knowledge, nature, or anything else from the base examples, but from the excellent ones.

1205b1 **15.** Similarly, pleasure too is a good in kind, since the fact that there are base pleasures is not something that escapes our notice either. For since there are also differences in the natures of the animals (for example, a base nature and an excellent one—that of a human being, for example, being excellent, that of a wolf or of some other wild beast being base, and, in the same way, there is one nature for a horse, another for a human being, ass, or dog), **16.** and since pleasure is a restoration[196] from what is contrary to nature to the state natural for each one, the result is that this would be special to it: to a base nature, at any rate, a base pleasure. For it is not the same thing to a horse and a human being, nor likewise to the others. But since indeed their natures differ, their pleasures differ too. For pleasure, we saw, is a restoration, and a restoration[197] restored to a natural state, so that of a base nature the restoration would be base, and of an excellent one excellent.

17. But those who say that pleasure is not an excellent thing are in a state of mind like those who, not knowing nectar, think that the gods drink wine, and that there is nothing more pleasant than it. But they are in this state of mind because of ignorance. The ones who say that all pleasures are comings to be and not a good are in a similar state of mind; for because they do not know that there are other pleasures besides the bodily ones, and see that these are comings to be and not an excellent thing, they think that, in general, pleasure is not a good.

18. Since, then, there is pleasure when a natural state is being restored and when it has been restored (for example, of the one when it is being restored, those that are

193. Reading ἡ.
194. Reading Νηλεῖ.
195. Reading δόξειεν.
196. I.e., in the view of those being criticized. See 2.7.10.
197. Omitting φασίν.

replenishments of a lack, of the other when it has been restored, those from seeing, hearing, and those of that sort), the activities of the natural state when it has been restored would be better. For the things that are said to be pleasures in both these ways are activities, so that it is clear that the pleasures from seeing, hearing, and thinking would be best, since the bodily ones, at any rate, are from a replenishment.

19. Further, this was also said, that pleasure is not a good, since what exists in all and is common to all is not a good. A thing of this sort, [they say,] more properly belongs to an honor-lover and a love of honor. For the honor-lover is the one who wishes to be sole possessor of [a good] and by such means to surpass the others. And so pleasure, if it is going to be a good, at any rate,[198] must be something of this sort. **20.** Surely this is not so. Rather, in fact, the contrary would seem to be a good because of this, because all things seek it. For all things naturally seek what is good, so that if all things seek pleasure, pleasure must be in kind a good.

21. Again too, on the grounds that pleasure is an impediment, it was stated that it **1206^{a}1** is not a good. But the claim that it is an impediment appears to be the case to them because they do not investigate in a correct way. For the pleasure from the thing being done is not an impediment. However, if it is alien, it is an impediment—for example, the pleasure from drunkenness is an impediment to doing things. **22.** But in this way one science will also be an impediment to another science. For it is not possible to be active in both at the same time. But why is a science not a good if it produces the pleasure that is from the science? And will it be an impediment? Surely not! Rather, one will be more a doer of actions. **23.** For pleasure impels one to be more a doer of actions when it is from the thing itself. For let the excellent person do what he does in accord with virtue, and do it with pleasure—will he not therefore be much more active with regard to the action? And if he does indeed do it with pleasure, he will be excellent, and if he is pained when he does what is noble, not excellent. For pain is felt at things due to compulsion, so that if someone is pained at doing noble actions, he is compelled to do them. But the one who does them from compulsion is not excellent.

24. But then it is not possible, of course, to act in accord with virtue without being pained or pleased. The in-between is not possible. Why? Because virtue lies in feeling, feeling lies in pain or pleasure, and to lie in between is not possible. It is clear, then, that virtue too involves pain or pleasure. Thus, if someone does the noble things with pain, he is not excellent. Thus, virtue could not involve pain. Therefore, it involves pleasure. **25.** Therefore, it is not only the case that pleasure is not an impediment, but it actually excites action, and, in general, it is not possible for virtue to be without the pleasure that comes about from it.

26. Another argument was that no science produces pleasure. But this is not true either. For gourmet cooks, garland makers, and parfumiers are productive of pleasure. (But for the other sciences, indeed, pleasure is not an end; rather, they involve

198. Reading γ᾽ ἀγαθὸν.

pleasure and are not without pleasure.)[199] There is, then, in fact a science that is productive of pleasure.

27. Yet another argument stated that pleasure is not best of all. But in this way and by this sort of argument you will do away with the so-called particular virtues too. For courage is not best of all. Is it not, then, a good because of this? Surely this is absurd! It is the same way too in the case of the others. Neither, then, is pleasure not a good, because it is not best of all.

28. To pass on, a puzzle of the following sort might be raised in the case of the virtues. I mean, since reason sometimes masters feelings (for we said this[200] in the case of the self-controlled person), and feelings again conversely master reason (for example, this happens in the case of those who lack self-control), and since the non-rational **1206b1** part of the soul that possesses vice masters reason, which is well-disposed (for the person who lacks self-control is of this sort), and reason likewise, when it is basely disposed, will master feelings that are well-disposed and possess their proper virtue—if [all] this will be so, the result will be that virtue is used badly (for when the person who is basely disposed due to his reason[201] uses virtue, he will use it badly). A result of this sort would seem absurd.

29. It is easy to reply to and resolve a puzzle of this sort on the basis of what was said by us before[202] about virtue. For we said that there is virtue at the time when reason, being well-disposed, is commensurable with feelings that possess their proper virtue, and the feelings with reason. For when they are disposed in this way they will be in harmony with each other, so that reason always prescribes what is best, while the well-disposed feelings readily do what reason may prescribe. **30.** If, then, reason is basely disposed, while the feelings are well-disposed, there will not be virtue, because of the failure of reason; for virtue is composed of both. So it is not possible to make a bad use of virtue either.

In general, it is not the case, as others think, that reason is the starting-point and leader of the virtues, but rather the feelings are. For there must first appear in us (as does in fact appear) a non-rational impulse toward the noble. Then, on the supposition that this is so, reason must later appear, putting the question to the vote and passing judgment. **31.** One may see this from children and those who live without reason. For in these, impulses of feeling, without reason, toward the noble appear first, while reason, appearing later and voting with them, produces the doing of noble things. But if they have taken their starting-point toward the noble things from reason, this is not the case: the feelings do not follow along in agreement, but rather they often go contrary to it. That is why feeling, when well-disposed, seems to be more of a starting-point for virtue than reason does.

202. 1202a8–18.

2.8
Good Luck

1. After this, the next thing to speak about would be good luck, since it is with happiness that our account is concerned. For ordinary people think that the happy life is the lucky one, or, at any rate, is not without good luck, and perhaps they are correct. For without the external goods, which luck controls, it is not possible to be happy. That is why we must speak about good luck, saying who, in general, the lucky person is, in what sort of things, and concerned with what.

2. First, then, someone coming upon and looking at the following things might raise a puzzle. For one would not say of luck that it is nature. For what nature is a cause of is for the most part or always[203] in the same way productive of, but luck never is, but is disorderly and random. That is why luck is said to be present in these sorts **1207^{a}1** of cases. Neither is it any sort of understanding, then, or correct reason; for there too, to no less an extent, there is what is ordered and always the same way, but not luck. That is why indeed where there is most understanding and reason, there is least luck, and where there is most luck, there is least understanding.

3. But is luck a sort of care from a god,[204] at least? Surely, it would not seem to be this! For we think that when the god has control of such things, he assigns good and bad things to those who deserve them, while luck and the things due to luck truly come about as random luck would have it. But if we assign this sort of thing to the god, we will make him a poor judge, or else not a just one; and this is not fitting for the[205] god.

4. But outside of these there is surely no other place we can assign to luck, so it is clear that it would be one of these. Understanding, reason, and scientific knowledge seem entirely alien to it. But then the care and goodwill of the god would not seem to be good luck either, because the latter appears even among base people. But the god is not likely to care for base people. **5.** Nature remains, then, and it is most akin to good luck.

Good luck and luck are found in things that are not up to us, things we are not in control of and are not capable of doing in action. That is why no one says that the just person, insofar as he is just, has good luck, or the courageous person, or, in general, anyone else who is in accord with virtue. For it is up to us to have or not to have these. But, in fact, it is in[206] the following sorts of things that we more properly speak of good luck. For we say that a well-bred person has good luck, and, in general, anyone to whom the sorts of goods belong that he himself is not in control of.

203. Reading ἀεὶ here.
204. Reading θεοῦ.
205. Retaining τῷ.
206. Reading ἐν.

6. Nonetheless, it is not even here that good luck in the strict sense would be referred to. For someone is said to have good luck in many ways. For we say that the person who happens to do in action something good contrary to his own rational calculation has good luck, and the sort who got a profit, when in accord with reason he should have got a loss, we say has good luck. **7.** Good luck, then, consists in having something good contrary to reasonable expectation, and in not getting something bad that is in accord with reasonable expectation. But good luck would seem to consist more in and to be more akin to getting what is good. For getting what is good would seem to be intrinsically a piece of good luck, while not getting what is bad would seem to be coincidentally a piece of good luck.

8. Good luck, then, is non-rational nature; for the person who has good luck is the one who has an impulse without reason toward good things and attains these. But this belongs to nature; for there is by nature present in the soul the sort of thing[207] due to which we are non-rationally impelled toward things we would be well suited for. **9.** And if one were to ask a person in this state, "Why does it please you to act in this way?" and he replies, "I do not know, but it does please me," he is affected like those who are possessed. For those who are possessed also have an impulse without reason toward doing something.

10. We do not have a proper and special name to call good luck by, but we often say that it is a "cause," though being a cause is alien to its name. For a cause is distinct from what it is a cause of, and we speak of it as a cause without there being any impulse toward attaining good things, as a cause[208] of our not getting what is bad, or, on the other hand, of getting something good when one is not thinking one will get something good. **11.** This sort of luck, then, is distinct from the previous sort, and it seems to come about from the vicissitudes of things, and to be coincidentally good luck. So, if this sort is also good luck, at any rate, the other sort is more akin to happiness, the one in which the starting-point of the impulse for the attaining of good things is in the agent himself.

12. Since, then, there is no happiness without external goods, and these come about due to good luck, in the way we just said, good luck would be a co-worker with happiness.

2.9
Noble-Goodness

1. So much, then, concerning good luck; but since we have spoken about each of the virtues one by one, it remains also[209] to state a universal synthesis summing up the particular cases.

207. Reading ἔνεστί τι φύσει.
208. Reading οἵαν.
209. Reading εἴη καὶ.

2. There is a name, then, that is not badly applied to the excellent person, "noble-goodness." For a person is noble and good, they say, when he is completely virtuous. For it is with respect to virtue that they say that someone is noble and good—for example, they say that the just person is noble and good, the courageous person, the temperate person, and, in general, with respect to all the virtues.

3. Since then we divide in two, and say that some things are noble and others, in turn,[210] good, and of the good ones, some are unconditionally good and others not, and since noble things are, for example, the virtues and actions due to the virtues, and good ones are, for example,[211] ruling office, wealth, reputation, honor, and things of this sort, the noble-and-good person is the one to whom the unconditionally good things are good and the unconditionally noble ones noble. For this sort of person is noble and good.

4. But the one for whom the unconditionally good things are not good is not noble and good, just as the person would not seem to be healthy either, for whom the unconditionally healthy things are not healthy. For if wealth and ruling office harm someone when they come, they would not be choiceworthy; rather, he will wish the sorts of things for himself that will not harm him. **5.** But the sort of person who is such as to shrink from something good in order for it not to be his would not seem **1208ª1** to be noble and good. But the one for whom all the good things are good, and is not destroyed by them, for example, by wealth or ruling office—he is the sort of person who is noble and good.

2.10
Correct Reason

1. We have spoken[212] about acting correctly in accord with the virtues, but not in an adequate way. For we said that it is acting in accord with correct reason. But presumably someone might be ignorant of this very thing, and might ask, "What exactly is the 'in accord with correct reason'?" and "Where is correct reason to be found?" **2.** Acting in accord with correct reason, then, is when the non-rational part of the soul does not prevent the rationally calculating part from activating its own activity. For then the action will be in accord with correct reason. For since we have one part of the soul that is inferior and another that is superior, and the inferior is always for the sake of the superior, as, in the case of body and soul, the body is for the sake of the soul, and we say that the body is in a good state at the time when its state is such that it does not prevent but rather contributes to and aids by impelling toward the soul's completing its work (for the inferior is for the sake of the superior, with a view to working together with it).

210. Retaining καὶ.
211. Retaining οἷον.
212. $1198^{a}10$–21.

3. When, then, the feelings do not prevent the understanding from completing[213] its own work, what is in accord with correct reason will come about. Yes, but presumably someone might respond, "What state must the feelings be in, so that they do not prevent it, and when are they in this state? For I do not know." **4.** Something of this sort is indeed not easy to put into words. Not even, in fact, for the doctor. "But when he says that barley-gruel is to be administered to a feverish patient, how am I to perceive[214] that he is feverish?" "When," he replies, "you see that he is pale." "But how will I know when he is pale?" At this point, let the doctor acknowledge the fact:[215] "If you do not have within yourself," he will say,[216] "the capacity to perceive things of this sort, then you no longer can." In like manner, the argument applies in common to other things of these sorts. **5.** It is the same way in the case of knowing the feelings; for one must contribute something oneself to any perception.

6. But perhaps someone might further raise the following sort of question: "If I in fact know these things, will I then be happy?" For they think so. But it is not like this. For none of the other sciences imparts to the learner the use and the activity either, but only the state. Similarly here, knowledge of these things does not impart the use either (for happiness is an activity, as we say[217]), but rather the state; nor does happiness consist in knowing what it comes from, but from making use of these. **7.** But the use and the activity of these is not for this study to impart;[218] for no other science imparts the use either, but rather the state.

2.11
Friendship

1. In addition to all this it is necessary to speak about friendship, what it is, what it is found in, and what it is concerned with. For since we see it extending throughout the whole of life and on every occasion, and being a good thing, it would have to be included also with a view to happiness.

2. First, then, it is presumably better to go through the puzzles and questions that are raised. Is friendship found among those who are alike, as is believed and said? For "jackdaw," they say, "sits by jackdaw," and "always a god leads like to like."[219] They also say that once when a dog always slept on the same tile, and Empedocles was asked why the dog always slept on the same tile, he said it was because the dog had

218. Reading παραδοῦναι.
219. Homer, *Odyssey* 17.218.

something similar to the tile, implying that it was because of the likeness that the dog resorted to it.[220]

3. But then again, on the other hand, it seems to certain others that it is rather among contraries that friendship appears, for "earth," they say, "is in love with rain, when the plain is dry."[221] It is contrary, then, they say, that wishes to be a friend to contrary. For among those who are alike it is not possible for it to come about. For like, they say, has no need of like, and so forth.

4. Further, does it take work to become a friend, or is it easy to become one? At any rate, flatterers who quickly dance attendance on us are certainly not friends, though they appear to be.

5. Further, such puzzles as the following are raised. Will the excellent person be a friend to the base one? Or will he not? For friendship lies in trust and stability, but the base person is least of all of this sort. And will the base person be a friend to a base one, or is not even this the case?

6. First, then, we must determine what sort of friendship we are investigating. For there is, so people think, friendship for a god and for inanimate things; but this is not correct. For friendship, we say, exists [only] in those cases where there is reciprocal loving, but friendship for a god admits neither of reciprocal loving nor of loving at all. For it would be strange if someone were to say that he loved Zeus. **7.** Nor indeed is reciprocal loving possible from inanimate things. And there is, of course, friendship for inanimate things—for example, for wine or something else of this sort. That is why it is neither friendship for the god nor for inanimate things that we [want to] investigate further, but that for animate ones, and for those in which there is reciprocal loving.

8. If, then, one were next to investigate what the lovable is, it is nothing other than the good. The lovable and what is to-be-loved are distinct, just the wish-able-for and what is to-be-wished-for are as well. **9.** For the wish-able-for is the unconditionally good, but what is to-be-wished-for is the good for the given person. Likewise too the unconditional good is lovable, but the good for oneself is what is to-be-loved. So the **1209^{a}1** lovable is also to-be-loved, but what is to-be-loved is not lovable.

10. It is here, then, and because of this that the puzzle arises as to whether the excellent person is a friend to the base one or not. For attached in a way to the good is the good for oneself, and to the lovable what is to-be-loved; and involved with and following along with the good are the pleasant and the advantageous. **11.** There is friendship among excellent people when they reciprocally love each other. But they love each other insofar as they are lovable; and they are lovable insofar as they are good. **12.** "But will not the excellent person," someone says, "therefore not be a friend to the base one?" No, he will be. For since the good is followed, as we saw, by the advantageous and the pleasant, insofar as, though base, the base person is pleasant, to

220. *EE* $1235^{a}12$–13.
221. Euripides, Fr. 698 Nauck.

that extent he is a friend. And, again, with being advantageous, insofar as he is advantageous, to that extent he is a friend. **13.** But this sort of friendship will not, at any rate, be in accord with the lovable (for it is the good, we saw, that is lovable, and the base person is not lovable). No, but it will be in accord with what is to-be-loved. For these friendships—the one in accord with the pleasant and the one in accord with the advantageous—derive from complete friendship, the one among excellent people.

14. He, then, who loves in accord with the pleasant does not love with the friendship that is in accord with the good, nor does the one who loves in accord with the advantageous. **15.** But these friendships (the one in accord with the good, the one in accord with the pleasant, and the one in accord with the advantageous), though they are not the same, are not entirely alien to each other either, but depend in a way on the same thing. For example, we say that a knife is medical, that a human being is medical, and that a science is medical. But these are not said to be so in the same way; rather, the knife is said to be medical due to its being useful to medical science, a human being due to his being productive of health, and a science due to its being cause and starting-point.

16. Similarly, the friendships—that of excellent people, which is because of the good, that in accord with the pleasant, and that in accord with the advantageous—are not all [said to be such] in the same way. But neither are they said to be such homonymously; rather, though they are not the same, they are concerned with the same things in a way and based on the same things. **17.** If, then, someone were to say, "The one who loves in accord with the pleasant is not a friend to this person; for he is not a friend in accord with the good," such a person is having recourse to the friendship of excellent people, which is based on all these things (the good, the pleasant, and the advantageous), so that he is truly not a friend in accord with[222] *that* friendship, but rather with the one in accord with pleasure or in accord with the advantageous.

18. Will, then, the excellent person be a friend to the excellent one, or will he not? For like, they say, has no need of like. An argument of this sort, then, is seeking the friendship that is in accord with the advantageous. For if they are friends insofar as one needs the other, they are to that extent involved in the friendship that is in accord with the advantageous. **19.** But the friendship that is in accord with the advantageous was distinguished as being distinct from the friendship that is in accord with virtue or with pleasure. It makes perfect sense, then, that [excellent people] will be friends to a much greater degree. For all the things—the good, the pleasant, and the advantageous—belong to these.

20. But the excellent person will also be a friend to the base one; for insofar as he may be pleasant, to that extent he is a friend. And the base person even with the base one; for insofar as the same thing is advantageous for them, to that extent he is perhaps a friend.[223] For we see this happening when what is advantageous is the same,

222. Retaining κατ'.
223. Reading φίλος.

that they are friends because of the advantageous. So nothing will prevent some same thing from being advantageous even to base people.

21. But it makes perfect sense that the friendship among excellent people, the one that is in accord with virtue and the good, is most stable, most steadfast, and most noble. For virtue, because of which the friendship exists, is unchanging, so that it makes perfect sense that this sort of friendship is unchanging. The advantageous, on the other hand, is never the same. That is why friendship that exists because of the advantageous is not stable, but changes along with what is advantageous. **22.** It is the same way too with the friendship that is in accord with pleasure.

The friendship, then, of the best people is the one that comes about in accord with virtue, that of ordinary people in accord with the advantageous, and the one in accord with pleasure in unrefined people and people at random.

23. It happens too that people get annoyed and surprised when they find that their friends are base people. But it is not at all strange. For when friendship takes pleasure as its starting-point, and people are friends because of it, or because of the advantageous, as soon as these leave the friendship does not remain either. **24.** But often, though the friendship does remain, they were treated badly by their friend. That is why they get annoyed. But this is not unreasonable either. For your friendship with him did not exist because of virtue. That is why it is also not strange that he does none of the things that are in accord with virtue. They were not correct, then, to get annoyed. For though they made the friendship because of pleasure, they think that the one because of virtue should accrue to them. But this is not possible; for the friendship because of pleasure and the one because of the advantageous are not connected to virtue. **25.** While sharing in pleasure, then, they—not correctly—seek virtue; for virtue does not follow along with pleasure and the advantageous, but these both follow along with virtue. For it would be absurd not to think that the excellent people are most pleasant to themselves; for even base people, as Euripides says,[224] are pleasant to themselves: "For bad to bad is welded." For virtue does not follow along with pleasure, while pleasure does follow along with virtue.

26. But need there be pleasure in the friendship of excellent people, or need there not be? It would indeed be strange to say that there need not be. For if you remove their being pleasant to each other from them, they will supply themselves with other friends with a view to living together—ones that *are* pleasant. For with a view to **1210^{a}1** living together there is nothing more important than being pleasant. **27.** It would be strange, then, not to think that excellent people must, most of all, live together with each other; and this is not possible without the element of pleasure. Therefore, it must be, as makes perfect sense, that their being pleasant belongs most of all to them.

28. But since friendships haven been divided into three forms, and since in the case of these the puzzle was raised[225] as to whether friendship comes about in respect

224. *Bellerophon*, Fr. 298 Nauck. See *EE* $1238^{a}35$.
225. $1208^{b}8$–20.

of equality or in respect of inequality, the answer, then, is that it is possible in accord with either. For the one in accord with likeness is the friendship of excellent people, which is complete friendship, while the one in accord with unlikeness is the one in accord with the advantageous. For the poor person is friends with the well-off person because of his need of the things the rich one is well supplied with, and the base person with the excellent one because of the same thing; for because of his need of virtue he is friends with the person he thinks he will get it from. **29.** Among unequals, then, friendship in accord with the advantageous comes about. That is also why Euripides says: "Earth is in love with rain, when the plain is dry,"[226] on the supposition that between those contraries friendship because of the advantageous appears. For even if you wished to make fire and water the things that are most contrary, these are useful to each other. **30.** For fire perishes, they say, if it does not have liquid, as this provides it with a sort of nourishment, but it does this to the extent that the fire can master it; for if you make the liquid too great, you will produce an overmastering and extinguishing of the fire, while if it is commensurable, it will be of benefit. It is clear, then, that even between things that are most contrary friendship because of the advantageous appears.

31. All friendships, both those in respect of equality and those in respect of inequality, fit into the three we have distinguished. But in all friendships there is a difference that arises between the friends when they are not alike in loving, doing good, being of service, or something else of this sort; for when one does a thing zealously and the other deficiently, in keeping with the deficiency there is complaint and grievance.

32. Nonetheless, in the sorts of cases in which the end of the friendship is the same (for example, if both are friends with each other in accord with the advantageous, in accord with the pleasant, or in accord with virtue), the deficiency on the part of the other person is clear to see. If, then, you do more good things for me than[227] I do for you, I no longer dispute that you should be loved more by me. **33.** But in a friendship in which we are not friends because of the same thing, the differences are greater. For a deficiency on the part of either is not clear to see. For example, if one is a friend because of pleasure and the other because of the advantageous, there dispute arises; for the one whose superiority is in the advantageous does not think that the pleasure is a worthy exchange for the advantage, nor does the one whose superiority is in pleasure think that he receives in advantage a favor worthy of the pleasure. That is why differences arise more in these sorts of friendships.

34. But those who are friends in respect of inequality, since they are superior in wealth or something else of this sort, do not think that they themselves should love; instead, they think that they should be loved by those who are more in need. But it is better to love than to be loved. **35.** For loving is a sort of activity of pleasure and a

226. Euripides, Fr. 698 Nauck.
227. Reading ἤ.

good, while from being loved no activity comes about for the beloved. **36.** Further, it is better to know than to be known; for to be known and to be loved belongs even to inanimate things, while knowing and loving belong to animate ones. **37.** Further, to be productive of good is better than not to be; for the person who loves, insofar as he loves, is productive of good, while the beloved, insofar as he is beloved, is not.

38. But human beings, because of their love of honor, wish more to be loved than to love, because in being loved there is a sort of superiority; for the one who is loved is always superior in pleasure, wealth, or virtue, and the lover of honor desires superiority. **39.** And those who are in a position of superiority do not think that they themselves should love; for they think they are making a return to those who love them in those things in which they are superior. Further, the others are inferior to them, which is why they think they should not love but be loved. On the other hand, the one who is in need of money, pleasure, or virtue wonders at the one who is superior[228] in these things, and loves because he is getting these or thinks he will get them.

40. Friendships of these sorts also arise from feelings of sympathy, that is, from wishing good things for someone. But the friendship that arises in these cases does not have all the requisites; for often we wish good things for one person, yet wish to live with another. **41.** But should we say that these are friendships, or that they are feelings characteristic of complete friendship, the one that is in accord with virtue? For in the latter friendship all these are present; for there is in fact no one else we would wish to live with (for the pleasant, the advantageous, and virtue are present in the excellent person), and it is for him that we would most of all wish good things, and for none other than him to live and to live well.

42. Whether a person can have self-friendship[229]—that is, friendship toward himself—or not, let us leave aside for the moment; we will speak of it later.[230] But we do wish all these requisites for ourselves. For we wish to live with ourselves (presumably, this is actually necessary), to live well, to live, and the wishing of the good is to no one else.[231] **43.** Further, we have sympathy for ourselves most of all. For if we suffer defeat or if something else of the sort befalls us we at once feel distress. That is why it would in this way seem that there is friendship toward oneself.[232]

44. We speak, then, of these sorts of requisites (for example, sympathy, living well, and the others), by referring back either to friendship toward ourselves or to complete friendship; for all these requisites are present in both; for living together, the wish for someone's existence and well-being, and all the others are present in these. **1211^{a}1**

45. Further, it might perhaps seem that the things in which there is justice are also the ones in which there is friendship; that is also why there are as many forms of friendships as there are of just [relations]. There is, then, the just for guest-friend in

228. Reading ὑπερέχοντα.
229. Reading αὐτοφιλία.
230. $1211^{a}16$–$^{b}3$.
231. $1211^{a}32$–33, $1213^{a}10$–13.
232. Reading αὐτῷ πρὸς αὐτὸν.

relation to citizen, for slave in relation to master, citizen in relation to citizen, son in relation to father, and wife in relation to husband, and every other sort of community, in general, and there are friendships present in each of these. But the most stable would seem to be guest-friendships. **46.** For they have no common end to dispute about, as citizens do; for when these dispute with each other for superiority, they do not remain friends.

47. The next thing would be to say now whether there is friendship toward oneself or not. Since, then, as we also said a bit above,[233] we see that loving is known from the requisite particulars, that it is for ourselves that we would most wish these (good things, existence, and well-being), have most sympathy for ourselves, and wish most of all to live with ourselves, the result—if friendship is known from the requisite particulars, and we would wish the requisite particulars to belong to ourselves—is that there clearly is friendship toward ourselves, just as there is even, we said,[234] injustice toward ourselves. **48.** For since the one who does injustice is one person and the one who suffers injustice is another, and here each is one and the same person, because of this, there seemed not to be injustice toward oneself.

However, as we said,[235] when doing an investigation into the parts of the soul, since there are several, it is possible, when these are not in concord, that there is then injustice toward oneself. **49.** In a similar way to this, then, there would also seem to be friendship toward oneself. For since a friend—as we say, when we wish to say that he is a very great friend—is, we say, "my soul and another's in one," and since there are, then, several parts of the soul, there will be one soul at the time when reason and the feelings are in harmony with each other (for that way it will be one); so when it has become one soul there will be friendship toward oneself.

50. And this friendship toward oneself will be present in the excellent person; for in him alone the parts of the soul are in a good state in relation to each other, due to their not differing, since the base person, at least, is never a friend to himself, for he is always fighting with himself. At any rate, the person who lacks self-control, when he has done in action something in accord with pleasure, not long afterward regrets
1211b1 and reproaches himself. And in the case of the various vices, the base person's state is similar; for he is continually fighting with and going contrary to himself.

51. There is in fact friendship in respect of equality—for example, that of companions is in respect of arithmetical equality and capacity for good (for neither of them deserves to have more goods than the other, either in number, or capacity, or size, but rather what is equal; for companions wish to be equal). **52.** But that of father toward son is in respect of inequality, as is that of ruled and ruler, superior and inferior, wife and husband, and, in general, in those cases in which there is one who has the position of inferior or superior in the friendship. **53.** For this friendship in

233. 1211a1–5.
234. 1196a28.
235. 1196a25–30.

respect of inequality is proportional. For in the case of giving a good no one would ever give an equal one to the better and the worse, but always a greater one to the superior party. And this is the proportionally equal; for the inferior having a lesser good is in a way equal[236] to the superior having a greater one.

2.12
Paternal Friendship

1. Of all the friendships that have been mentioned it is in familial friendship in a way that loving most of all appears, and particularly in the relation of father toward son. And why exactly is it that the father loves the son more than the son loves the father? Is it, then, as some people correctly say—with the approval of ordinary people, at least—because the father has in a way conferred a benefit on the son, while the son owes him a debt of gratitude for the benefit? **2.** This cause, then, would seem to also[237] belong in the friendship that is in accord with the advantageous. But as we see it to hold also with respect to the sciences, so it holds in a way here too. **3.** I mean, for example, that in some the end and the activity are the same, and there is no other end beyond the activity. For example, for the pipe player the activity and end are the same (for playing the pipe is both his end and activity), but not for the craft of building (for it in fact has another end beyond the activity). **4.** Friendship, then, is a sort of activity, and beyond the activity of loving there is no end, but rather this itself is the end. The father is always more active in a way, deriving from the son's being a sort of product of his. And this we see to be so in the other cases too; for all feel a sort of goodwill[238] toward what they have themselves produced. **5.** The father, then, feels a sort of goodwill toward the son as being his own product, led on by memory and by hope. That is why the father loves the son more than the son does the father.

6. But there are other things that are called and that seem to be sorts of friendships that must be investigated to see if they are friendships. For example, goodwill seems to be friendship. But unconditionally, goodwill would not seem to be friendship. **7.** For **1212^{a}1** we have goodwill toward many people and on many occasions from seeing or hearing something good about them. Are we therefore also immediately friends? Surely not! For it is not the case that if someone has goodwill toward Darius in Persia, as perhaps someone did, there was immediately friendship in him toward Darius. **8.** On the other hand, goodwill would seem to be sometimes a starting-point of friendship, and might become friendship if one adds a wish to do good things, when one is capable of it, for the sake of the person one feels goodwill toward. **9.** But goodwill belongs to character and is toward character. For no one is said to have goodwill toward wine or any other inanimate good or pleasant thing. But if someone is of excellent character,

236. Reading ἴσος.
237. Retaining καὶ.
238. Reading εὔνοοι here and at 1212^{a}4.

toward him there is good-will. **10.** Good will is not separate from friendship, then, but is in the same province. That is why it seems to be friendship.

11. Concord is closely allied to friendship, if you take concord in the strict sense. For if someone makes the same suppositions as Empedocles, and the elements seem to him to be as they did to the latter, is he therefore in concord with Empedocles? Surely not! Since this sort of agreement[239] is concerned with something else. **12.** For, first, concord is found not in matters of thought but in practical ones, and in these not insofar as the parties think the same thing, but insofar as, together with thinking the same, they make, where the things they think are concerned, a deliberate choice of the same ones. For if both parties have it in mind to rule, but one has himself in mind and the other *himself*, are they now therefore in concord? Surely not! But if I wish that I rule and he wishes that I rule, in this way we are now in concord. **13.** Concord, then, is found in what is doable in action and involves a wish for the same thing. Therefore, it is establishing the same person as ruler regarding practical matters that is concord in the strict sense.

2.13
Self-Love

1. Since there is, as we say,[240] friendship toward oneself, will the excellent person be a self-lover or not? A self-lover is the one who does everything for his own sake in matters of profit. The base person, then, is a self-lover (for he does everything for his own sake), but the excellent one is not. For it is because of this that he is excellent, that he does this [or that] for the sake of another, which is why he is not a self-lover.

2. But all have an impulse toward good things and think that they should most of all possess them. This is most evident in the case of wealth and ruling office. The excellent person will sacrifice these for another, not on the supposition that they are not most fitting for him, but if he sees that another will be capable of making more use of them than himself. But other people, due to ignorance, will not do this (for they do not think that they would make bad use of good things of this sort), or due
1212b1 to an ambition to rule. **3.** But the excellent person will not suffer from either of these. That is why he is not a self-lover, at any rate, with regard to these sorts of goods, but, if at all, with respect to the noble. For this is the only thing he would not sacrifice for another, while he will sacrifice what is advantageous and pleasant.[241] **4.** When the choice, then, is with respect to the noble he will be a self-lover, but when it is said with respect to the advantageous and with respect to pleasure, the excellent person will not be a self-lover, but rather the base person will.

239. Reading τὸ τοιοῦτον.
240. 2.11.47.
241. Reading τοῦ συμφέροντος καὶ ἡδέος.

2.14
Will the Excellent Person Love Himself Most?

1. Will the excellent person love himself most, or not? In a way, he will love himself most and, in a way, not. For since we say[242] that the excellent person will sacrifice things that are good in accord with the advantageous for his friend, he will love his friend more than himself. **2.** Yes, but it is insofar as he procures the noble for himself in sacrificing them that, to that extent, he does sacrifice these sorts of things. There is, then, a way in which he loves his friend more than himself, and a way in which he loves himself most; for in accord with the advantageous, he loves his friend more, but in accord with the noble and good, he loves himself most; for he procures these for himself as being noblest. **3.** He is, then, in fact a good-lover, not a self-lover; for if indeed he does love himself, it is only because he is good. But the base person is a self-lover; for he has nothing because of which he will love himself, such as something noble, but will love himself, insofar as he is himself, without these. That is why in fact he may be called a "self-lover" in the strict sense.

2.15
Self-Sufficiency

1. The next thing to speak about would be self-sufficiency and the self-sufficient person, to see whether the self-sufficient person needs friendship in addition or not, but will be sufficient for himself also with respect to this. For even the poets say such things as "When your *daimôn* does well (*eu*) by you, what need of friends?"[243] Hence the puzzle also arises of whether the person who has all the goods, since he is self-sufficient, will also need a friend in addition. Or is it then that he will need friends most of all? For to whom will he do good? Or with whom will he live? For surely he will not spend his time alone. **2.** If, then, he will need these things, and it is not possible to get them without friendship, the self-sufficient person would need friends in addition.

3. The similarity on the basis of [the example of] the god, then, that is customarily assumed in arguments is not correct there, nor would it be useful here. For if the god is self-sufficient and needs no one, it does not follow because of this that we need no one. **4.** For there is in fact an argument of this sort stated about the god. For since, it says, the god has all the goods and is self-sufficient, what will he do? For he will not lie asleep. He will, then, contemplate something, it says. For this is most noble and most appropriate. What, then, will he contemplate? For if he will contemplate something else, he will contemplate something better than himself. But it is absurd that there is **1213^{a}1**

242. $1212^{a}36$–$^{b}2$.
243. Euripides, *Orestes* 667.

something better than the god.[244] Therefore, he will contemplate himself. But this is absurd. For if a human being were [to spend his time] looking closely at himself, we would rebuke him as indifferent [to other things]. It is absurd, then, it says, if the god will contemplate himself.

5. But let us leave aside what the god will contemplate; for the self-sufficiency about which we are making an investigation is not that of the god, but of a human being, as to whether a self-sufficient one will need friendship or not. If, then, on looking at one's friend and seeing what one's friend is and of what sort he is, he would be such[245] as another I—at any rate, if you have made a very good friend. Just as in the saying, "This is another Heracles,"[246] a friend is another I.

6. Since, then, it is a most difficult thing to know oneself, as in fact some of the wise have said, and a most pleasant one (for knowing oneself is pleasant), and we are not capable of contemplating ourselves by ourselves (that we are not capable is clear from the way in which we blame other people, but do not notice ourselves doing the same things, **7.** and this comes about because of sympathy or because of feeling—things many of us are blinded by when it comes to judging correctly), just as, then, when we wish to see our own faces, we know them by looking at a mirror, in the same way when we wish to know ourselves, we can know them by looking at our friend; for the friend, as we say, is another I. **8.** If, then, knowing oneself is pleasant, and it is not possible to know this without another who is a friend, the self-sufficient person would need friendship when it comes to knowing himself.

9. Further, if indeed it is also noble, as it is, to do good when one has the goods that come from luck, to whom will the self-sufficient person do it? And with whom will he live? For surely he will not spend his time alone; for living together is pleasant and necessary. If, then, these things are noble, pleasant, and necessary, and these are not possible without friendship, the self-sufficient person would need friendship in addition.

2.16
How Many Friends Should One Have?

1. Should one possess many friends, or few? Simply speaking, they should neither be many nor few. For if they are many it takes work to assign a part of one's love to each. For in all other things the weakness of our nature also makes us incapable of reaching far. For we do not see far with our sight either, but if you take it further than a fitting distance, sight falls short due to the weakness of our nature, and likewise in the case of hearing and all the others. **2.** By falling short in love, then, due to incapacity, one would not unjustly get complaints, and would not be a friend, for not loving except,

244. *EE* 1248a29–30.
245. Reading εἴη ἄν τοιοῦτος.
246. *EE* 1245a31–32.

of course, in name. But this is not what friendship requires. **3.** Further, if they are many, it will not be possible to cease from being pained; for when they are many, it is likely that some bit of bad luck, the occurrence of which necessarily causes pain, be happening to at least one of them. On the other hand, again, neither should they be few, one or two, but rather a number commensurable to one's circumstance and one's impulse to love.

2.17
How Friends Should Be Treated

1. Next we must investigate how one should treat a friend. But this investigation is not in respect of every friendship, but the one in which the friends complain most to each other. But they do not complain in the same way in the various ones. For example, in that of father toward son there is not the sort of complaint that people think fitting in some friendships, "as I to you, so you to me," failing which there is violent complaint there. **2.** But between unequal friends, the equal is not possible, and the friendship of father toward son is in respect of inequality, likewise that of wife toward husband, or servant toward master, and, in general, of inferior and superior. They will not, then,[247] have complaints of this sort. Instead, it is between equal friends and in a friendship between them[248] that this sort of complaint arises. So we must investigate how we should treat a friend in the friendship between equals. . . .[249]

EUDEMIAN ETHICS*

BOOK 1

1.1
What Happiness Consists In and How It Is to Be Acquired

The man who in the precinct of the god on Delos[1] made known his maxim, which he inscribed on the gateway of the temple of Leto, distinguished, as not all belonging to the same thing, the good, the noble, and the pleasant. He wrote: **1214ª1**

> The noblest thing is the most just; the best to be healthy;
> Most pleasant of all, however, is to get what one loves.[2] 5

But we do not concede this. For happiness, since it is noblest and best, is most pleasant of all.

About each thing at issue and each nature there are many speculations that involve a puzzle and need investigation; of these, some pertain to knowing only, while others also concern acquisition and action in relation to the thing at issue. With regard to those that involve theoretical philosophy alone it must be stated[3] at the opportune moment whatever is proper to the methodical inquiry. 10

But first what living well consists in and how it is to be acquired must be investigated: Are all those who merit the title of being happy, happy by nature, as with the tall, the short, or those who differ in color? Or is it through learning, happiness being a sort of scientific knowledge? Or through some sort of practice (for many things are present in human beings neither in accord with nature nor with learning, but rather with having been habituated—bad ones if they have been badly habituated, good ones if in a good way). Or is it in accord with none of these ways, but one of the two following ones: like human beings who are taken possession of by nymphs or gods, by being inspired by a sort of daimonic thing, like those who are in ecstasy; or else due to luck (for many people say that happiness and good luck are the same). 15 20

---

* Translated by C. D. C. Reeve. Text: Christopher Rowe, *Aristotelis Ethica Eudemia* (Oxford, 2023).

1. Apollo; Leto is his mother.
2. *NE* 1099ª26–27.
3. 1216ᵇ36–1217ª17.

That it is by the presence of all, some, or one of these that happiness is present in human beings is not unclear. For pretty much all its origins fall under one of these starting-points; for in fact one may group together all actions resulting from thought with actions resulting from scientific knowledge.

But being happy and living in a blessed and noble way would seem to lie most of all in three things, the ones that seem most choiceworthy. For some say that the greatest good is practical wisdom, others that it is virtue, and others that it is pleasure. And about their relative importance to happiness some people 1214b1 disagree, saying that one of them contributes more to it than another, some—on the supposition that it is a greater good—that practical wisdom does so more than virtue, others that virtue does more than practical wisdom, others that pleasure does more than both of them. And to some it seems that living happily is based on all of them, to others on two, and to others that it lies in a certain one of them.

1.2
Happiness and Its Preconditions

Fixing his thought on these considerations, then, anyone capable of living in accord with his own deliberate choice posits some target for living nobly, whether honor, reputation, wealth, or education, looking toward which he will do all his actions (on the supposition that not to order one's life in relation to some end is a sign of great foolishness). Above all, then, he must first determine within himself, neither impetuously nor carelessly, in which things of ours living well consists, and which ones it is not possible for this to belong to human beings without.

For what it is not possible to be healthy without is not the same as health. And this holds in the same way too in many other cases. So neither is living nobly the same as what one is not capable of living nobly without. Among things of this sort, some are not special to health or to [noble] living, but common (one might almost say) to everything, to both states and actions (for example, without breathing, being awake, or sharing in movement nothing would belong to us, whether good or bad), while others are more special to each [individual] nature, and one must not overlook these; for eating meat and taking walks after dinner are not appropriate in the same way to being in good condition as the things mentioned.

These indeed are the causes of the dispute about happiness, about what it is and due to what things it comes about; for what it is not possible to be happy without some people consider to be parts of happiness.

1.3
Beliefs about Happiness

To examine all the beliefs that certain people hold about happiness is superfluous; for many things appear to be so to young children, the sick, and those who are deranged, but no one—at any rate, no one with understanding—would go through puzzles about these; for what these people need is not arguments but in some cases the change that comes with age, in others a medical or political corrective; for drugs are no less a corrective than blows.[4] Likewise, there is no need to investigate the beliefs of ordinary people (for they speak at random about pretty much everything, and especially about happiness); for it would be absurd to present an argument to those who need not arguments, but rather to suffer. But since there are puzzles proper to each study, it is clear that there are those concerning the most excellent life and best way of living too. These, then, are the beliefs it is well to examine; for the refutations of those who dispute [them] are demonstrations of the contrary arguments.

Besides, it furthers the work not to fail to consider things of this sort, especially as regards the ones the entire investigation must pertain to, the ones on the basis of which it is possible to share in living well and nobly (if to say "living in a blessedly happy way" is too liable to incite divine envy), and as regards the hopes of decent people that arise in each case. For if living nobly depends on what comes about due to luck or by nature, it would be a hopeless aspiration for many people (for its acquisition is neither up to them nor due to their supervision or their own study). But if it depends on one's being of a certain quality and on the actions that are one's own, the good would be a more common and more divine thing—more common, because more people can share in it; more divine, because happiness resides in those who establish themselves as being of a certain quality and in their actions.

1.4
Three Lives

Most of the disputes and the puzzles gone through will be evident if what one must consider happiness to be is correctly defined, whether it depends only on the soul's being of a certain quality, as some of the older wise people thought, or whether, though a certain quality must indeed belong to oneself, it is more a matter of one's actions being of a certain quality.

Various lives have been distinguished, and of these some are not even among the disputants for this sort of joy, but rather busy themselves in various ways for the sake of the necessities of life—for example, those having to do with the unrefined crafts, and the one having to do with money-making, and the commonplace ones

4. I.e., blows of a whip assigned as punishment for a crime.

(by "unrefined" I mean those undertaken with a view to reputation only; by "commonplace" I mean the sedentary ones and wage-earning ones; by "wealth-acquiring" I mean the commercial ones related to buying and selling). But because those assigned as conducive to happiness, the ones that were in fact mentioned previously[5] as the greatest of goods for human beings, are three, virtue, practical wisdom, and pleasure, we see that there are three lives that all who have the resources deliberately choose to live—political, philosophical, and that of indulgence.

1215b1 For, of these, the philosophical life tends to be concerned with practical wisdom and theoretical investigation concerning the truth, the political one with noble actions (for these are the ones that result from virtue), and the one of indulgence in bodily pleasures. That is why one calls one person "happy," another another, as was also said previously.[6] For Anaxagoras of Clazomenae, when asked who was happiest, said, "none of those you would consider so, but someone who would appear strange to you."[7] He replied in this way because he saw that the questioner assumed it to be impossible for someone who was not a great man, noble and rich, to merit this title, while he himself perhaps thought that it was the one living painlessly and in a pure way in the eyes of justice, or sharing in some sort of divine contemplation, who was said to be blessedly happy in the way a human being is.

1.5
Which Things in Life Are Choiceworthy

Surely there are many other things that it is difficult to judge correctly about, but it is especially difficult to do so about the one that seems easiest to everyone and that every man (supposedly) knows, namely, which of the things in life is choiceworthy, and which, when grasped, would satisfy the appetite of one who has it. For many things that happen are of the sort due to which people give up their life—for example, diseases, excessive pains, or calamities. So it is clear that it might even from the start have been choiceworthy, because of these considerations at least, not to be born at all,[8] if one were given the choice. In addition to these things, [there is] the life people live while still children; for in fact no one who was thinking correctly could abide returning to it. Further, both many of the things that involve neither pleasure nor pain, as well as many of the ones that involve pleasure, but not a noble one, are of the sort that make not existing better than living. In general, if one were to collect together all the things that people do in action and that everyone suffers, yet never voluntarily (because these are not done or suffered for their own sake), and even were

5. 1214a30–33.
6. 1214a30–b5.
7. A30 DK. See F90 51.10.
8. F75.

an unlimited amount of time added, no one for their sake would choose living over not living.

But surely, then, neither would anyone who was not a complete slave prefer living for the pleasure of nourishment alone or the pleasure of sex, when the other pleasures are subtracted, the ones that knowledge, sight, or any of the other perceptual modalities provide to human beings. For it is clear that to the one making this choice there would be no difference between being born a beast or a human being. At any rate, the ox in Egypt, which they honor as the god Apis, has a more abundant share in more of these sorts of things than many monarchs. But by the same token no one would choose living because of the pleasure in sleeping;[9] for what is the difference between sleeping in un-waking sleep from the first day to the last for ten thousand or however many years and living as a plant? That, at any rate, is the sort of life that plants seem to share in, just as infants also do. And in fact when these are first generated within the mother they continue growing, but sleep the entire time. So it is evident from these sorts of considerations that what makes living living well, and what the good is in living, eludes those investigating it.

They say that Anaxagoras, when someone went through these sorts of puzzles and asked him for the sake of what would a person choose to be born rather than not born, replied, "to contemplate the heaven and the order of the whole cosmos."[10] He for his part, then, thought it to be for the sake of a sort of scientific knowledge that the choice of living is an estimable one. On the other hand, those who regard Sardanapalus as blessed, or Smindyrides the Sybarite, or any others living the life of indulgence, all surely appear to place happiness in enjoyment. Some others, however, would choose neither any sort of practical wisdom nor bodily pleasures in preference to actions arising from virtue. At any rate, there are some people who choose these not only for the sake of reputation, but even when they do not expect to be well regarded. But most politicians do not truly merit this title; for they are not true politicians; for the [true] politician is one who is disposed to deliberately choose noble actions for their own sake, while most people fasten on living this way because of money and greed.

From what has been said, then, it is evident that everyone attributes happiness to three lives, political, philosophical, and the life of indulgence. Of these, the pleasure having to do with bodily indulgence, what it is, what sort of thing it is, and due to what sorts of things it comes about, is not unclear. So there is no need to inquire about what these are, but rather whether or not they contribute anything to happiness and in what way they contribute; and, if we must attach certain pleasures to living nobly, whether these are the ones we must connect to it; or whether, though a happy person must share in them in some other way, there are other pleasures reasonably thought to be the ones due to which he is living pleasantly, and not merely without pain.

9. *NE* 1095ᵇ31–1096ᵃ2.
10. 1215ᵇ7–14.

But these issues must be investigated later on.[11] First, we will get a theoretical grasp on virtue and practical wisdom, what the nature of each of them is, and whether they are parts of the good life, either themselves or the actions that result from them, since, if not everyone connects them with happiness, all the people worth taking account of do.

Socrates the elder thought the knowledge of virtue to be [the] end, and used to inquire what justice is, and courage, and each of the parts of virtue. Indeed, he did this reasonably. For he thought all of the virtues to be sorts of scientific knowledge, so that both knowing justice and being just would occur at the same time; for at the same time as we have learned geometry and house-building, we are actually housebuilders and geometers. That is why he used to inquire about what virtue is, but not how it comes about or from what sources. And this is what happens in the case of the theoretical sciences; for there is nothing else belonging to astronomy, natural science, or geometry than knowing and having a theoretical grasp on the nature of the things that are the underlying subjects of those sciences—nonetheless, nothing prevents them from being coincidentally useful to us in relation to many of the necessities of life.

In the case of productive sciences, on the other hand, the end is distinct from the science and from knowledge—for example, health is the end of medicine and good legislative order, or something else of this sort, is the end of politics. It is noble, of course, to know each of the noble things. Nonetheless, as regards virtue, knowing what it is is not the most estimable thing, but rather knowing what it comes from. For we do not wish to know what courage is, but rather to be courageous, nor to know what justice is, but rather to be just, just as we also wish to be healthy rather than to know what health is, and to be in a good state rather than to know what it is to be in a good state.

1.6
The Method of Inquiry

Concerning all these issues we must try to seek conviction by means of arguments, using the things that appear to be so as witnesses and paradigms. For the best thing is if human beings are in evident agreement with all that we are going to say; but, if not, that they are so in a way at least, which is precisely what they will do once we have made them change their minds; for each one has something of his own related to the truth, and it is from such [views] that it is necessary to somehow prove [what we can] about these issues; for on the basis of what is truly but not perspicuously stated, we will make progress toward perspicuousness, always substituting what is more knowable for what is usually expressed in a confused way.

11. *NE* 1152b1–1154b31.

In each methodical inquiry, arguments stated in a philosophical way differ from those not stated in a philosophical way. That is why even politicians should not regard as superfluous the sort of theoretical investigation that makes evident not only the that but also the why. For this is the sort of thing that is philosophical in each methodical inquiry. Yet much caution is needed here. For there are those who, because it seems to be characteristic of the philosopher never to speak at random but rather in accord with argument, often escape notice when they state arguments that are foreign to the study and empty (sometimes they do this through ignorance, sometimes through boastfulness). Under the influence of these even people of experience and capable of doing things end up getting taken in by those who neither have nor are capable of architectonic or practical thought. And they suffer this fate due to lack of educatedness; for lack of educatedness regarding each thing is being incapable of judging arguments proper to that thing from those alien to it.

It is also correct to judge separately the argument for the cause and what is being proved, both because of what was just said, that one must not in all cases pay heed to what is due to argument, but often rather to what appears to be so (but as things stand, when people are unable to refute [an argument], they feel compelled to put their trust in what has been stated) and because often what seems to have been proved by argument is true, yet not due to the very cause that the argument claims. For it is possible to prove a truth through a falsehood, as is clear from the *Analytics*.[12]

1.7
The Greatest of Human Goods

And having made these remarks by way of a preface, let us start first, as was said,[13] from those first things that are not stated perspicuously, seeking to discover in a perspicuous way what happiness is. Happiness is surely agreed to be the greatest and best of human goods. We say "human" because perhaps there could also be happiness for some other superior being—for example, a god. For of the other animals, all the ones that are inferior in nature to human beings, none shares in meriting this title; for no horse, bird, or fish is happy, nor any other being that does not, as the name suggests,[14] have in its nature a share of something divine. Instead, one lives better and another worse in accord with some other way of sharing in good things.

But that this is the way things stand must be investigated later on.[15] For now, though, let us state that some good things are doable in action by a human being, others not doable in action. We state it this way because some beings have no share in

12. *APr*. $53^{b}8$–10, $57^{a}40$–$^{b}17$, *APo*. $88^{a}20$–26.
13. $1216^{b}26$–36.
14. *Eudaimonia* ("happiness") derives from *eu* ("well," "good") and *daimôn*, and so has the etymological meaning of being blessed with a good *daimôn*.
15. There is no focal discussion of this issue in *EE*.

movement, so not in the [relevant] goods either, and perhaps these are the things that are best by nature. And some things are doable in action but doable only by beings superior to us. But since things are said to be achievable by action in two ways (for both the things for whose sake we do an action and the things we do for the sake of these have a share in action—for example, we put both health and wealth among the things achievable by action, and also the things we do for the sake of these, the health-producing and wealth-acquiring ones), it is clear that happiness too must be put down as the best of the things achievable by action by a human being.

1.8
What the Best Good Is

We must investigate, therefore, what the best is, and in how many ways something is said to be so. There appear to be especially three beliefs about this. For they say that the good itself is the best thing of all, and moreover that the good itself is that to which it belongs both to be the first among goods and the cause, by its presence, of other things being good; and that both these things belong to the Form of the good. (By "both" I mean being the first among goods and being the cause, by its presence, of other things being good); for, indeed, "good" is said especially truly of the Form; for it is by participation in it and similarity to it that the other things are good, and it is first among the goods; for if the thing participated in is done away with, the participants in the Form—the ones that are said to be good by participating in it—are done away with too, and what is first bears this relation to what is posterior. So the good itself is the Form of the good; and it is indeed separable from its participants, just as is also the case for the other Forms.

To investigate this belief fully, then, belongs to another sort of occasion, that is, to one that, of necessity, is in many ways more logico-linguistic (for arguments that are at once both destructive and common are in accord with no other science[16]). But if one must speak succinctly about these issues, let us say, first, that to speak of there being a Form not only of good but of anything else whatever is to speak in a logico-linguistic and empty way. This has been investigated in many ways both in the external accounts and in the philosophical ones. Further, even if there most of all are Forms and a Form of the good, they are of no use at all either in relation to living a good life or in relation to actions.

For "good" is said of things in many ways, in as many ways indeed as "being" is; for indeed "being," as was determined elsewhere,[17] signifies the what-it-is, quality, quantity, when, and in addition what is changed and what changes things. And the good is found in each of these categories: in substance, the understanding and the

16. I.e., dialectic.
17. *Met.* 1017a22–30.

god; in quality, the just; in quantity, the moderate; in time, the opportune moment; and in change, the one teaching and the one being taught. Just as, then, there is not some one being embracing the things mentioned, so too neither is the good one thing, nor is there one science either of being or of good. But neither is it up to one science to get a theoretical grasp even on the goods said of things in a categorially similar way—for example, the opportune moment or the moderate. On the contrary, distinct sciences get a theoretical grasp on distinct sorts of opportune moment, and distinct ones on distinct sorts of the moderate—for example, in the case of nourishment, medicine and athletic training get a grasp on the opportune moment and the moderate, in the case of military actions, generalship does, and in this way distinct ones on distinct sorts of action, so that to get a theoretical grasp even on the good itself can scarcely be up to one science.

Further, in such cases where there is a prior and a posterior, there is no common thing beyond these cases, and it separable. For then there would be something prior to the first thing; for what is common and separable is prior because, were the common one done away with, the first would be done away with—for example, if the double is the first multiple, the multiple predicated of all of them in common cannot be separable from them; for it would then be prior to the double. Or else the common thing turns out to be the Form—for example, if one were to make the common thing separable. For if justice is a good, and courage, then there is, they say, a good itself. The "itself," then, is added to the common account. And what would this be except what is eternal and separable? Yet what is white for many days is no more white than what is white for one day, so that neither is the common good the same as the Form;[18] for the common one belongs to all [goods].

The good itself must be proved in a way opposite to the one in which they prove it at present. For at present they start from things that are not agreed to possess the good, and from these they prove the ones that are agreed to be good: it is from numbers that they prove that justice is a good, and that health is a good; for these are [sorts of] order and number, on the supposition that the good belongs to numbers and units because the one is the good-itself.[19] But they should start from the agreed goods (for example, health, strength, and temperance), and prove that the noble is present even more in immovable things; for the former things are all [cases of] order and rest. Therefore, if those are [sorts of order], the latter [immovable] ones are so even more, as these things[20] belong even more to them.

Dangerously metaphorical, too, is their demonstration that the one is the good itself, on the grounds that the numbers seek it. For they also do not say clearly how they seek it, but state this in too simple a way. Besides, how is one to suppose that desire is present in things that are not living? They should busy themselves more

18. Which is eternally white.
19. *Met.* $1091^{b}13$–14.
20. I.e., order and number.

about this, and not claim, without argument, what is not easy to believe even with argument. And the assertion that all beings seek a certain single good is not true; for each thing desires its own good: an eye, sight; a body, health; and in the same way another thing, another good.

Such puzzles have it, then, that there is not a good itself, and that it is not useful to politics; instead, there is a special good for politics, just as there is a special good for the others[21]—for example, in the case of physical training, good condition. {And further, there is what has been written in the argument: either the Form itself of the good is not in fact useful to any science or it is useful to all alike.}[22] Further, it is not doable in action. Similarly, the common good is not the good-itself either (for it would belong even to a small good), nor is it doable in action. For medicine does not busy itself with how anything whatever will come to belong to something, but in what way health will. And likewise too in the case of each of the other crafts. But good is said of things in many ways, and part of it is noble, and some good is doable in action, some not. But the sort of good that is doable in action, the for-the-sake-of-which, is not the one found in immovable things.

It is evident, then, that neither the Form of the good nor the common good is the good itself that we are seeking (for the former is immovable and not doable in action, the latter, though movable, is not doable in action), but rather it is the for-the-sake-of-which as the end that is the best good, a cause of the ones falling under it, and first of all [of them]. So the good itself would be this: the end of the things doable in action by a human being. And this falls under the science with control over all sciences. And this science is politics, household management, and practical wisdom. For these states differ from the others in being of this sort. Whether they differ at all from each other must be stated later on.[23]

That the end is a cause of the things falling under it is made clear by teaching. For teachers, after defining the end, prove that each of the other things is a good; for the for-the-sake-of-which is a cause. For example, since being healthy is this, necessarily this is advantageous for it. And the healthy is a cause of health as cause of movement, but then it is a cause of health's existence not of its being good. Further, no one proves that health is good, unless he is not a doctor but a sophist (for they are the ones who produce sophistries by using alien arguments), any more than he proves any other starting-point whatever.

But the good as end for a human being, and the best thing doable in action, must be investigated to see in how many ways the best one of all [is said of things], since it is best.

21. I.e., crafts or sciences.
22. Probably a gloss amplifying Aristotle's own summing up.
23. 5.8 = *NE* 6.8.

BOOK 2

2.1
Virtue of Character and of Thought; the Work of the Human Soul; Happiness

After this, taking a new starting-point, what comes next must be stated. All good things, then, are either external or within the soul, and the more choiceworthy of these are the ones within the soul, just as we distinguish them even in the external accounts; for practical wisdom, virtue, and pleasure are within the soul, and some or all of these seem to everyone to be the end. Among those within the soul, some are states or capacities, others activities or movements.

Let this be assumed too about virtue, that it is the best disposition, state, or capacity of each of the things that has some use or work. This is clear from induction. For **1219ª1** we suppose all cases to be this way. For example, that there is a virtue of a cloak; for it has a work and a use; and the best state of the cloak is its virtue. Likewise in the case of a ship, a house, and the others. So too in the case of the soul; for the soul has a certain work. And let the work of the better state, then, be better.

Also, as the states stand in relation to each other, so let the works that derive from them stand in relation to each other too. And the work of each thing is its end. Therefore, it is evident from this that the work is better than the state; for the end, as end, is best; for it was assumed that the best thing and the last thing, for the sake of which all the others [exist], is an end. Therefore, that the work is better than the state and the disposition is clear.

But work is said of things in two ways. For of some things the work is beyond the use—for example, the work of the craft of building is a house, not the process of building, and the work of the craft of medicine is health, not the process of making healthy or medically treating. In the case of other things, the use is the work—for example, the work of sight is seeing, and the work of mathematical science is contemplation. So it is necessary, where the use is the work, for the use to be better than the state.

Having made these determinations in this way, let us say that the work of a thing and the work of its virtue are the same, though not in the same way. For example, the work of the craft of shoemaking, and of the process of shoemaking, is a shoe. If, then, there is some virtue of the craft of shoemaking and of an excellent shoemaker, the work is an excellent shoe. And it is the same way in other cases. Further, let the work of the soul be to produce life, and of this using and being awake. For sleep is a sort of idling and resting. So, since it is necessary for the work of the soul and its virtue to be one and the same, the work of its virtue would be excellent living. This, therefore, is the superior good,[24] which is precisely what happiness was [agreed to be].[25]

24. Reading τὸ πλέον ἀγαθόν.
25. $1217^{a}22$–23.

This is clear from our assumptions; for happiness was assumed to be the best thing. But the ends within the soul and the best goods are either states or activities. So, since the activity is better than the disposition, and the best activity is of the best state, and virtue is the best state, the activity of the soul's virtue will be the best thing. But happiness too was assumed to be the best thing. Therefore, happiness is the activity of the good soul. But since happiness was agreed to be something complete, and living can be complete or incomplete, and virtue is the same way (for in one case it is a whole, in another a part), and the activity of what is incomplete is itself incomplete, happiness would be the activity of complete living in accord with complete virtue.

The things that seem to be so to all of us are a witness that we are stating the kind and defining mark of happiness correctly. For both doing well in action and living well are the same thing as being happy, and each of these, both living and action, is a use and an activity (for the practical [life] is the [life] of using; for the coppersmith makes a bridle, while the horseman uses it), and one cannot be happy either for [only] one day, or as a child, or for [only] an entire stage of one's life. That is also why Solon had it right about not felicitating someone while he is alive, but only when life attains completion; for nothing incomplete is happy; for it is not a whole.

Further, awards of praise for virtue are due to works, and encomia are for works, and it is the winners who get the victory crowns, not those who have the capacity to win but do not win. And one judges what sort of person someone is on the basis of his works. Further, why is happiness not praised? It is because the other things are praised because of it, either by being referred back to it, or by being parts of it. That is why felicitation, praise, and encomium are all distinct. For an encomium is a speech about a particular work, while praise is for a person's being universally of the relevant sort, and felicitation pertains to the end.

Also, [the resolution of] the puzzle that is sometimes raised is clear from these considerations, as to why excellent people are no better than base ones for half their life, for all are similar while asleep. The cause is that sleep is an idling of the soul, not an activity. That is why, if there is some other part of the soul, for example, the nutritive part, its virtue is not a part of the whole virtue, just as neither will the virtue of the body be; for the nutritive part is more active in sleep, while the perceptual part and desiring part are incompletely active in sleep. But insofar as they share in some way in movement, even the things that appear [in the dreams] of better people are better, unless due to illness or disability.

Next, we must get a theoretical grasp on the soul; for the virtue is virtue of soul, and not coincidentally so. But since it is human virtue we are seeking, let us assume that there are two parts of the soul that share in reason, but do not both share in reason in the same way. Instead, one does so by being prescriptive, the other by being naturally obedient and listening. And if there is some part that is non-rational in another way, let us set it aside. It makes no difference whether the soul is divisible into parts or not divisible into parts; it still has different capacities, including the ones mentioned—just as in a curve the concave and the convex are inseparable, and the

straight and the white [in a line]; and yet the straight is not white, except coincidentally, and not in its substance.

And again if there is some other part of the soul (for example, the vegetative), it has been excluded. The parts mentioned are special to the human soul. That is why the virtues of the nutritive part and the part responsible for growth are not human virtues either; for if a part belongs to a human being insofar as he is a human being, rational calculation must be present, both starting-point and action. But rational calculation is a starting-point not of rational calculation but of desire and feelings. **1220^{a}1** Therefore, it is necessary for it [the human soul] to have these parts. And just as good condition is composed of the virtues of the parts, so too is the soul's virtue, insofar as it is an end.

There are two forms of virtue, one of character, the other of thought; for we praise not only the just but also those who comprehend and those who are theoretically wise; for virtue, or its work, was assumed to be praiseworthy. These are not themselves [intrinsically] active, but there are activities of them. But since the virtues of thought involve reason, these sorts of virtue are virtues of the part that has reason, which is the prescriptive part of the soul insofar as it has reason, while the virtues of character are virtues of the part that, though non-rational, is disposed to follow in accord with nature the part that has reason; for we do not say what sort of character someone has when we say that he is theoretically wise or clever, but when we say that he is mild-mannered or rash.

Next, we must investigate, first, virtue of character, what it is and what sorts of parts it has (for it leads up to this), and through what means it comes about. We must seek them, of course, as all who seek things in other areas do, having something in hand, so that it is always through things said truly but not in a perspicuous way that we try to grasp what is said truly and in a perspicuous way. For as things stand we are in a condition similar to having that health is the best disposition of the body or that Coriscus was the darkest-skinned man in the marketplace; for we do not know what either of the two of them is, but nevertheless being thus equipped furthers the work of knowing what each of them is.

Let it be assumed, then, first, that the best disposition comes about due to the best things, and that doing the best actions, as regards each thing, is due to the virtue of each—for example, the best exercises and nourishment are the ones due to which good condition comes about, and due to good condition the best exercises. Further, every disposition is brought about and destroyed due to the same things, as health is, due to nourishment, exercise, and season. These things are clear from induction.

Therefore, virtue too is a disposition of this sort, one brought about due to the best movements having to do with the soul, and from which the best works of the soul are put into action and the best feelings. And it is due to the same things that in one way virtue comes about, while in another way it is destroyed, and the use of it is related to the same things that cause it to grow or wither, and the ones in relation to which it disposes things in the best way. A sign of this is that both virtue and vice

are concerned with pleasures and pains; for correctives, being treatments, and being effected by means of contraries, just as in other cases, are by means of these.

2.2
Character, Feeling, Capacity, and State

It is clear, therefore, that virtue of character is concerned with pleasures and pains. But character (*êthos*) exists, as even its name signifies, because it develops due to habit (*ethos*), and something is habituated due to conduct that is not innate by being repeatedly moved in a certain way, so that it is then capable of being active in that way (something we do not see in inanimate things; for even if you throw a stone upward ten thousand times, it will never do this except by force). Hence, since [all that is so], let character be this: a quality of the soul of someone capable of following in accord with prescriptive reason.

It must be stated, then, what it is in the soul that our characters have the qualities they do in accord with. And it is in accord with the capacities for feelings, in accord with which people are said to be capable of feeling, and in accord with the states, in accord with which people are said, in relation to the feelings, to feel them in a certain way, or not to feel them. {Next, is the division, made in separate contexts,[26] between feelings, capacities, and states.}[27] By "feelings" I mean things of this sort, anger, fear, shame, appetite, and, in general, things that are for the most part accompanied intrinsically by perceptible pleasure or pain. And, though in accord with these, a person is not of a certain quality, but [just] feels them, in accord with capacities, a quality [is present]. By "capacities" I mean the ones in accord with which people are said to be active in accord with feelings—for example, irascible, impassive, prone to sexual desire, having a sense of shame, shameless. States are what are causes of these being present either in accord with reason or in a contrary way—for example, courage, temperance, cowardice, and intemperance.

2.3
Virtue as a Mean (1)

Having made these determinations, it must be grasped that in everything continuous and divisible there is excess, deficiency, and a mean, and these may be either in relation to each other or in relation to us—for example, in physical training, in medicine, in building, in navigation, and in any action whatever, whether based on scientific knowledge or not based on scientific knowledge, and whether based on

26. Reference unclear.
27. Secluded as a gloss.

craft knowledge or not based on craft knowledge; for movement is continuous and action is movement.

But in all cases the mean relative to us is best; for this is as scientific knowledge and reason prescribe. And in all cases it also produces the best state. This is clear through induction and through argument. For contraries destroy each other, and the extremes are contrary both to each other and to the mean; for the mean is each contrary in relation to the other—for example, the equal is greater than the smaller and smaller than the greater. So it is necessary for virtue of character to be concerned with certain means and to be a certain mean. Therefore, it must be grasped what sort of mean virtue is, and what sorts of means it is concerned with. For the sake of a paradigm, then, let us take, and get a theoretical grasp on, each item from the following table:

irascibility	impassivity	{mild-manneredness	
rashness	cowardice	courage	
shamelessness	bashfulness	sense of shame	**1221^{a}1**
intemperance	insensibility	temperance	
enviousness	nameless	indignation	
profit	loss	justice	
wastefulness	ungenerosity	generosity	
boastfulness	self-deprecation	truthfulness	
flattery	churlishness	friendliness	
ingratiation	surliness	dignity	
softness	long-sufferingness	resilience	
conceit	smallness of soul	greatness of soul	
extravagance	niggardliness	magnificence	
unscrupulousness	foolishness	practical wisdom}	

These affections, and others like them, occur in souls, and they are all said of things due in some cases to excess, in others to deficiency.[28]

For an irascible person is the one who gets more angry than one should, and more quickly, and at more things than one should; an impassive one is the one who is deficient in whom he is angry at, and when, and how; a rash person is the one who does not fear the things one should, nor when nor as one should; a cowardly one is the one who fears even things one should not, when one should not, and in a way one should not.

Similarly, an intemperate person is the appetitive one and excessive in every possible way; an insensible one is the one who is deficient and has no appetite even for what is better and in accord with nature, but is as insensitive as a stone. A profit-loving person is the one who tries to get more from every source; a self-sacrificer is the one who does so from no source, or from relatively few.

28. The third column, therefore, should perhaps be secluded as a careless addition.

A boastful person is the one who pretends to be more than he really is; a self-deprecator is the one who pretends to be less. Again, a flatterer is the one who is more ready to join in praise than is noble; a surly person is the one who is less ready. And the one who is overready to please is ingratiating; the one who is ready in few cases, or scarcely ever, is churlish.

Further, the one who is never ready to withstand pain, not even if it is better to do so, is soft; the one who alike withstands every pain is strictly speaking nameless, but by metaphorical transference is said to be hard, hardy, and long-suffering. A conceited person, on the other hand, is the one who thinks too highly of himself; a small-souled one is the one who thinks too little.

Further, an extravagant person is the one who goes to excess in every expenditure; an ungenerous person is the one deficient in all of them. Likewise too with the niggardly person and the pretentious one; for the latter exceeds what is appropriate, while the former falls short of what is appropriate. The unscrupulous person tries to get more in every way and from every source; the foolish one does not do so even from where one should. A person is envious by being pained at more cases of others' doing well than one should (for the envious are pained even by the doing well of those who deserve to do well); the person who is the contrary is more nameless, but
1221b1 is the one who is excessive by not being pained even at those who are undeservedly doing well; he is tolerant, like a glutton toward nourishment, while the other is intolerant in accord with his envy.

It is superfluous to define in each case that the relationship not be coincidental; for no other science, whether theoretical or productive, whether in what it says or what it does, adds this to its definitions. Instead, it is a response to the sophistries of the craftsmen of logico-linguistic arguments. Let us define them, then, simply in this way, but do so more exactly when we speak about the opposite states.

These affections themselves have forms with different names depending on whether the excess is in time, in intensity, or in relation to which thing is producing the feelings. I mean, for example, that a person is quick-tempered by being affected more quickly than one should, while the choleric person too is harsh by being so more than one should, bitter by tending to preserve his anger, violent and abusive by the punishments resulting from his anger. Gourmands, gluttons, and drunkards, on the other hand, [are so named] with reference to whatever sort of nourishment they have the affective capacity for enjoying contrary to reason.

One must not fail to recognize, however, that some of the [faults] we are talking about cannot be taken to lie in the how, if how is taken to lie in being affected more [or less]. For example, a person is not an adulterer by seducing married women more than one should (for there is no such thing). Instead, [adultery] itself is surely a sort of depravity; for both the affection and its being of such-and-such a quality are said in combination in the name. Wanton aggression is similar too. That is why, in fact, people dispute the accusation, saying that though they did have sexual intercourse, it was not adultery (for they were acting in ignorance or were compelled), and that,

though they struck a blow, it was not wanton aggression. And it is the same way too in other cases of this sort.

2.4
Virtue, Pleasure, and Pain

Having grasped these things, it must next be stated that since there are two parts of the soul, and virtues are distinguished in accord with these, there are those of the part that has reason, which are virtues of thought, whose work is truth, either about how things are, or how they come to be; and there are those of the part that is non-rational but has desire (for not every part of the soul has desire, assuming the soul is divisible into parts). It is necessary, then, for character to be base or excellent because of pursuing or avoiding certain pleasures and pains.

This is clear from the distinctions having to do with feelings, capacities, and states. For the capacities and states concern feelings, and feelings are distinguished by pain and pleasure. So, because of both these considerations and the things posited previously[29] it follows that every virtue of character is concerned with pleasures and pains. For whatever things a state of the soul naturally becomes better or worse due to, these are the ones it is related to and concerns. And people are base because of pleasures and pains, we say, by pursuing or avoiding them either as they should not or the ones they should not. That is also why everyone readily defines the virtues as absence of feeling, and rest where pleasure and pains are concerned, and the vices on the basis of their contraries.

2.5
Virtue as a Mean (2)

Since virtue has been assumed[30] to be the sort of state from which people are doers of the best actions, and in accord with it are most excellently disposed toward what is best (where best and most excellent is what is in accord with correct reason), and this is the mean between excess and deficiency that is relative to us, it would be necessary for virtue of character in each case to be a mean, and to be concerned with certain means in pleasures and pains, in pleasant and painful things. The mean will sometimes be in pleasures (for there is also excess and deficiency [in these]), sometimes in pains, and sometimes in both. For the one who enjoys excessively is excessive in pleasure, and the one who is pained excessively is so in the contrary way, and these either unconditionally or in relation to some defining mark—for example, when not

29. $1220^{a}23$–38, $1220^{b}34$–36.
30. $1220^{a}30$–38, $1220^{b}34$–36.

being pained or pleased as ordinary people are; the good person, however, is pained or pleased as one should be.

But since there is not a certain state due to which a person having it will be of the sort in the one case to receive an excess, in the other a deficiency, of the same thing, it is necessary, just as these are contrary to each other and to the mean, for the actions also in this way to be contrary to each other and to virtue.

Nonetheless, it does happen that in some cases all the contraries are quite evident; in others it is those on the side of excess, and sometimes it is those on the side of deficiency. The cause of the discrepancy is that the inequality or similarity in relation to the mean is not always to the same things, but rather sometimes a person may pass more quickly from excess to the mean state, sometimes from deficiency, and it is the one who is further away that seems more contrary to it—just as with the body too, in the case of exercises, excess is healthier than deficiency, and is closer to the mean, while in the case of nourishment, deficiency is healthier than excess. So too the deliberately choosing states that promote a love of physical training will be more health-friendly in each deliberate choice—in the one case, in those who exercise more, in the other in those who are more abstemious; and, in the one case, the person who does not exercise is contrary to the mean and to what reason prescribes, and not both [of those others], and, in the other, it will be the one devoted to indulgence and not the one who goes hungry.

This comes about because from the outset our nature is not in the same way distant from the mean in all cases, but rather we are less lovers of exercise, more devoted to indulgence. Likewise, this holds too as regards the soul. We assume as contrary [to the mean] that state to which we and ordinary people are more prone to make errors, while the other one, as if non-existent, escapes our notice (for because of its rarity, it is not perceived)—for example, anger is contrary to mild-manneredness and the angry person to the mild-mannered one. And yet there is also excess in the case of gentleness, being conciliatory, and not getting angry when beaten. But people of that sort are rare, and it is in the other direction that everyone more inclines. That is also why the spirit is not given to fawning.

Since the catalog of the states belonging to each of the feelings has been grasped, both the excesses and the deficiencies, and of the states contrary to these, in accord with which people are in accord with correct reason (what correct reason is and to what defining mark one should look to in saying what the mean is, must be investigated later on[31]), it is evident that all the virtues and vices of character are concerned with excesses and deficiencies of pleasures and pains, and that pleasures and pains come about due to the states and feelings mentioned. But surely the very best state concerning each is the mean. It is clear, therefore, that the virtues will be all or some of these means.

31. 1249a23–b25.

2.6
Human Beings as Starting-Points of Action

Let us, then, take another starting-point for the ensuing investigation. All the substances that are in accord with nature are, to be sure, starting-points of a certain sort, which is why each one is capable of generating many other substances of the same sort—for example, a human humans, and, similarly, an animal animals and a plant plants. But in addition to these the human being is, alone among the animals, at any rate, a starting-point of certain actions; for we would not say of any of the others that it does actions.

Among starting-points, however, those of the sort from which movements first stem are said to be controlling, and most rightly so those from which what does not admit of being otherwise stems, by which, presumably, the [primary] god rules. But in the case of immovable starting-points (for example, in that of mathematical ones), there is no element of control, and yet they are said, at any rate, to be [starting-points] on the basis of similarity; for there too if the starting-point is moved, then, especially, so would all the things proved change, though they do not change themselves by one doing away with the other, except by doing away with a hypothesis and proving something through that. But the human being is a starting-point of a certain sort of movement; for an action is a movement.

But since, as in other cases, the starting-point is a cause of what is or comes to be because of it, we must understand it just as in the case of demonstrations. For if it is necessary, if a triangle contains [angles equal to] two right angles, for a quadrilateral to contain four right angles, it is evident that the cause of this is the triangle having two right angles. At any rate, if the triangle changes, it is necessary for the quadrilateral to change as well—for example, if the triangle has three, the quadrilateral has six, if it has four, eight. And if it does not change, but stays such as it is, it is necessary for the other to stay such as it is. That what we are attempting to prove is necessary is clear from the *Analytics*.[32] Now, though, we can neither say in an exact way that it is not so, nor that it is so, except for this much: if nothing else is a cause of the triangle's being this way, then this would be a sort of starting-point and cause of what follows from it.

So if indeed some of the beings admit of being contrary to the way they are, it is necessary for their starting-points also to be of this sort. For what results from things that hold of necessity is necessary, while what results from those others admits of turning out in contrary ways. And many things of this sort are up to human beings, and the starting-points of these are human beings themselves. So it is evident that whatever actions the human being is a starting-point and controller of admit of both coming to be and not doing so, that their coming to be or not is up to himself, and that of these, at any rate, he is in control of their being or not being. And whatever

32. *APo*. 1.4.

is up to oneself to do or not to do, of these one is oneself a cause; and whatever one is a cause of is up to oneself.

Since both virtue and vice and the works due to them are in the one case praiseworthy and in the other blameworthy (for what is blamed or praised is not what comes about due to necessity, luck, or nature, but rather what we ourselves are causes of—for whatever someone else is the cause of, he is the one to whom the blame or the praise belongs), it is clear that both virtue and vice are concerned with what one is oneself the cause of, as starting-point of actions. Therefore, what sorts of things one is a cause of, as starting-point of actions, must be grasped. We are all agreed that each is a cause of whatever ones are voluntary and in accord with his deliberate choice, while of whatever ones are involuntary, he is not a cause. But it is clear that all the ones he deliberately chooses are also voluntary. It is clear, therefore, that both virtue and vice would concern things that are voluntary.

2.7
Voluntary and Involuntary (1)

Therefore, what the voluntary is, what the involuntary is, and what deliberate choice is must be grasped. Since virtue and vice are defined in terms of these, let us first investigate the voluntary and the involuntary. They might seem to concern one of three things, either being in accord with desire, in accord with deliberate choice, or in accord with thought—the voluntary being what is in accord with one of them, the involuntary being contrary to one of them. But desire in turn is in three divisions: wish, spirit, and appetite. So these must be distinguished, and, first, what is in accord with appetite.

Everything that is in accord with appetite would seem to be voluntary. For everything involuntary seems to be forced, and what is forced is painful, as is everything one is compelled to do or undergo. As Evenus says, "every necessary thing, indeed, has a troublesome nature."[33] So if something is painful, it is forced, and if it is forced, painful. Everything contrary to appetite is painful (for appetite is for the pleasant), so that it is forced and involuntary. Therefore, what is in accord with appetite is voluntary; for these are contrary to each other.

Further, all depravity makes one more unjust, lack of self-control seems to be [a sort of] depravity, and the person who lacks self-control, he who acts in accord with appetite, is such as to act contrary to rational calculation, and acts without self-control whenever he is active in accord with appetite. But acting unjustly is voluntary. So the person who lacks self-control will be acting unjustly by acting in accord with
1223b1 appetite. Therefore, he will act voluntarily, and what is in accord with appetite will be

33. Fr.8 Diehl.

voluntary. For it would indeed be strange if those who come to lack self-control will [thereby] be more just.

On the basis of these considerations, then, it would seem that what is in accord with appetite is voluntary, but on the basis of the following ones, the contrary. For everything that one does voluntarily, one does wishing to do it, and what one wishes to do, one does voluntarily. But no one wishes for what he thinks to be bad. But then the one who acts without self-control does not do what he wishes; for to act, due to appetite, contrary to what one thinks to be best, is to act without self-control. So the result will be that the same person acts voluntarily and involuntarily at the same time. But this is impossible.

Further, the self-controlled person will act justly, and more so than the one who lacks self-control, for self-control is a virtue, and virtue makes people more just. But one acts with self-control whenever one acts contrary to appetite and in accord with rational calculation. So, if acting justly is voluntary, so too is acting unjustly (for both seem to be voluntary, and it is necessary, if the one is voluntary, for the other to be so as well). But acting contrary to appetite is involuntary. Therefore, the same person will do the same action voluntarily and involuntarily at the same time.

The same argument also applies to spirit. For lack of self-control and self-control also seem to have to do with spirit, just as with appetite, that is, what is contrary to spirit is painful, and restraining it forced. So, if what is forced is involuntary, everything that is in accord with spirit would be voluntary. And Heraclitus too seems to say, looking to the strength of spirit, that preventing it is painful; "for it is difficult," he says, "to fight against spirit; for it pays with soul."[34]

But if it is impossible to do the same action voluntarily and involuntarily at the same time in regard to the same respect of the same thing, what accords with wish will be more voluntary than what accords with appetite and spirit. There is a proof of this; for we do many actions voluntarily without anger or appetite.

It remains, therefore, to investigate whether the wished and the voluntary are the same thing. But this too appears impossible. For it is assumed by us, and seems to be the case, that depravity makes people more unjust, and lack of self-control seems to be a sort of depravity. But [if the wished and the voluntary are the same thing], the contrary will follow. For no one wishes for what he thinks to be bad, yet one does it when one comes to lack self-control. If, then, acting unjustly is voluntary, and the voluntary is what is in accord with wish, when one comes to lack self-control one will no longer act unjustly, but will be more just than before coming to lack self-control. But this is impossible.

On the one hand, therefore, it is evident that the voluntary is not acting in accord with desire, nor the involuntary acting contrary to desire.

34. B85 DK.

2.8
Voluntariness, Deliberate Choice, Force, and Compulsion

On the other hand, that the voluntary is not acting in accord with deliberate choice is in turn clear from what follows. For what is in accord with wish has been demon-
1224a1 strated[35] not to be involuntary; rather, everything that one wishes is also voluntary. (But what has alone been proved is that it is in fact possible to act voluntarily not wishing to.) But there are many things that we do all of a sudden wishing to do them;
5 but no one deliberately chooses all of a sudden.

If it is necessary, as we saw,[36] for the voluntary to be one of these three things, either [acting] in accord with desire, or with deliberate choice, or with thought, and yet it is not two of these, it remains for the voluntary to lie in acting on the basis of a certain way of thinking.

Further, advancing the argument a little, let us conclude the definition of the
10 voluntary and the involuntary. For it seems that doing something by force and not by force are proper to the things mentioned; for we say both that what is forced is involuntary and that everything involuntary is forced. So we must first investigate the "by force," what it is, and how it stands in relation to the voluntary and involuntary.
15 It seems that, in the case of action, what is forced and what is compelled, and force and compulsion, are opposed to the voluntary and to persuasion. Universally, we speak of force and compulsion also in the case of inanimate things; for we say both that a stone spatially moves upward and the fire does so downward by force and compulsion. But when these spatially move in accord with nature and in accord with their
20 intrinsic impulse, this is not by force, but neither are they said to do so voluntarily, but rather the opposite condition is nameless. But when something moves contrary to this impulse, we say it does so by force.

And as in the case of inanimate things, so in the case of animals we see many things that are by force, both ones undergone and ones done, whenever something
25 moves them from without contrary to their internal impulse. In inanimate things the starting-point is simple, but in animate ones it is multiple; for desire and reason are not always in harmony. So, while in the case of other animals what is forced is simple, as it is in the case of inanimate things (for they do not have reason and desire that is contrary to it, but live by desire [alone]), in the human being, by contrast, both are present at a certain age, the one when we also attribute action to them. For we do not
30 say that a child does actions, or a wild beast either, but someone who is already doing things because of rational calculation.

It seems that everything forced is painful, and no one who does something by force enjoys doing it. That is why the most dispute arises about the self-controlled person and the one who lacks self-control. For each acts having impulses contrary to

35. 1223b27–36.
36. 1223a24–27.

himself, so that it is by force, they say, that the self-controlled person drags himself away from his appetites for pleasures (for dragging oneself away in the face of an opposing desire is painful), and it is also by force that the one who lacks self-control acts contrary to rational calculation. And he seems less pained (for appetite is for the pleasant and he enjoys following it). So the person who lacks self-control is more voluntary and not forced because he acts without pain. On the other hand, persuasion is opposed to force and compulsion. And the self-controlled person is driven toward **$1224^{b}1$** the things he is persuaded of, and proceeds not by force but voluntarily. Appetite, by contrast, drives without persuading; for it does not share in reason.

It has been stated, then, that these people alone seem to do actions due to force and voluntarily, and this is due to a certain cause, that there is a certain similarity to the force that we say applies also to inanimate things. Nonetheless, if one adds what was added to the definition in that case, the issue is resolved. For whenever something external moves something or causes it to rest contrary to the impulse internal to it, we say that it does so by force, and whenever it is not, not by force. In the person who lacks self-control and in the self-controlled one, it is the intrinsic impulse present in him that drives him (for they have both impulses), so that neither acts by force, but rather, because of these impulses, at any rate, voluntarily and not under compulsion. For a starting-point that is external and that is impeding or moving something contrary to its impulse, we say, is one that compels, as if someone, having grasped the hand of a person, were to strike another with it, in opposition both to what its owner wished and appetitively desired. But when the starting-point is internal, it is not by force.

Further, both pleasure and pain are present in both cases. For the one acting with self-control is immediately pained when he is acting contrary to appetite, but enjoys the pleasure of expecting that he will be benefited later, or even of being immediately benefited by acting in a healthy way; and the one who lacks self-control, though he enjoys getting what he appetitively desires by acting without self-control, is pained by the expectation of pain, since he thinks that he is doing a bad thing. So there is some reason to say that each acts due to force, and that, whether because of desire or because of rational calculation, each sometimes acts involuntarily; for the two elements, each being separate, get knocked out by each other. Hence people transfer it to the whole soul, when they see something of this sort in its parts. In the case of the parts it is possible to say this, but the whole soul, both of the person who lacks self-control and of the self-controlled one, does actions voluntarily. Neither of these people does anything by force, though an element in them does, given the fact that by nature we have both elements.

For indeed reason is among the things that are by nature starting-points—further it will be present if one's development is left to proceed and is not deformed—as also is appetite, in that it is present from the outset following birth. And it is pretty much by these two things that we define what is by nature: whatever is in everyone from the outset following birth; and whatever comes about for us when our development

is left to proceed normally—for example, gray hair, old age, and other things of this sort. So that each of the two people acts not in accord with nature [in a way], though unconditionally each acts in accord with nature, although not the same nature.

These, then, are the puzzles about the self-controlled person and the one who lacks self-control, about whether both act by force, or one or the other does, so that either it is not voluntary, or done by force and voluntary at the same time, and—if what is by force is involuntary—voluntary and involuntary at the same time. And it is pretty much clear to us from what has been said how one must reply.

There is another way, however, in which people are said to act by force and under compulsion, without any discord between reason and desire, when they do an action they suppose is both painful and base, yet if they do not do it, beating, imprisonment, or death would follow. For they did these actions, they say, by being compelled. Or is that not so, but rather everyone does the thing itself voluntarily? For it is possible not to do them, but rather to endure the relevant suffering.

Further, perhaps one might say that some of these are voluntary, others not. For whichever ones are of the sort whose non-existence or existence is up to oneself, all those one does not wishing to, one does voluntarily, and not by force. But whichever ones are of the sort where this is not up to oneself, one does by force in a way, but not, of course, unconditionally, because one does not deliberately choose the thing itself that one does, but rather what it is for the sake of, since in these cases too there is a certain difference. For if someone killed in order to prevent someone from catching hold of him, he would be ridiculous if he said that he did so by being forced and under compulsion. Instead, what he will suffer for not having done the action must be a greater evil and more painful. For in this way he will be acting under compulsion, and not by force, or not by nature, whenever he does evil for the sake of good or the deliverance from a greater evil, and he will, at any rate, be acting involuntarily; for these things are not up to himself.

That is why many people assume that even love is involuntary, as well as certain cases of anger and natural conditions, on the grounds that they are too strong for one's nature. And we have sympathetic consideration, on the supposition that these naturally force one's nature. And one would seem to be acting more by force and involuntarily in order to avoid being strongly pained, or rather not mildly, and, in general, in order to not be pained or in order to not be pleased. For what is up to oneself (and the whole issue is referred back to this) is what one's nature is able to bear. And what it is not able to bear, and is not by nature [within the scope] of one's desire or rational calculation, is not up to oneself. That is also why we do not say in the case of those who are inspired and make prophecies, even though they produce a work of thought, that nonetheless their saying the things they said, or doing the things they did, is up to them. But surely neither is it due to appetite. So, in fact, even certain thoughts and certain feelings, or the actions that are in accord with thoughts and rational calculations of these sorts, are not up to us, but rather, as Philolaus said,[37] some arguments are stronger than us.

37. B16 DK.

So, on the supposition that the voluntary and the involuntary and their relation to what is by force needed investigation, let this be determined in this way; for the things people say that most impede [our understanding of] the voluntary are to the effect that we have acted by force but not voluntarily.

2.9
Voluntary and Involuntary (2)

Since this discussion has now concluded, and the voluntary has been defined neither by desire nor by deliberate choice, it surely remains to define what being in accord **1225^{b}1** with thought is. The voluntary seems to be the contrary of the involuntary, and that knowing to whom, with what, or for the sake of what [one is doing something]—for sometimes, though one knows that this is one's father, one is not trying to kill him, but to save him, as happened with the daughters of Pelias;[38] or one knows that what one is doing something with is a drink, but thinks it is a love-potion and wine, when it is really hemlock—is the contrary of being ignorant of to whom one is doing something, with what one is doing it, and what, due to ignorance and not coincidentally, one is doing. And what is due to ignorance of what, with what, or to whom is involuntary; the contrary, therefore, is voluntary. Whatever, then, is up to oneself not to do that one does not in ignorance and due to oneself is necessarily voluntary, and this is the voluntary. On the other hand, whatever one does in ignorance and due to ignorance is involuntary.

But since scientifically knowing (indeed, knowing) is twofold, one consisting in possessing, the other in using scientific knowledge, the person who possesses it but does not use it would in a way rightly be said to be ignorant, and in a way not rightly—for example, if he failed to use it due to negligence. Similarly, someone who did not possess it would be blamed if it was something easy or necessary [to know], which he failed to possess due to negligence, pleasure, or pain. So these things must be added to the definition.

As regards the voluntary and the involuntary, then, let them be distinguished in this way.

2.10
Deliberate Choice

After this, let us talk about deliberate choice, first going through some puzzles concerning the account of it. For one might be in doubt about what kind it naturally

38. Pelias was the legendary king of Iolcus. Medea wanted her husband Jason to have his throne. So she led his daughters (the Peliades) to believe that chopping him up and boiling him with herbs would restore his youth. Instead, it killed him.

belongs to and where to put it, and whether the voluntary is or is not the same as the deliberately chosen. Certain people state, indeed, and it might seem so upon inquiry, that deliberate choice is most of all one of two things, either belief or desire; for both manifestly follow along with it.

That it is not desire is evident; for then it would be wish, appetite, or spirit, for no one desires anything without being affected by one of these. But then spirit and appetite are present even in wild beasts, while deliberate choice is not. Further, even in the case of those in whom both these things are present, many deliberate choices are made without spirit or appetite. And those in the grip of feelings are not deliberately choosing, but instead are being resilient. Further, appetite and spirit always involve pain, while many things are deliberately chosen in the absence of pain. But then wish and deliberate choice are not the same either. For people wish for some things knowing them to be impossible (for example, to both rule as king of all human beings and to be immortal), while no one, unless ignorant of the fact, deliberately chooses what is impossible, nor, in general, does anyone deliberately choose what is possible, if he does not think it is up to him to do or not to do it. So surely this is evident, that it is necessary for what one can deliberately choose to be something that is up to oneself.

Similarly, it is clear that deliberate choice is not belief either, or something that one simply thinks. For what one can deliberately choose, we saw, is something that is up to oneself, while we believe many things that are not up to ourselves—for example, that the diagonal is commensurable. Further, deliberate choice is not true or false. Neither, then, is it a belief about the things that are up to us to do in action, in virtue of which we end up thinking that we should do or not do one of them.

The following point jointly concerns belief and wish; for no one deliberately chooses an end, but what furthers the end. I mean, for example, that no one deliberately chooses to be healthy, but to walk around or sit down for the sake of being healthy, nor to be happy, but to make money or take a risk for the sake of being happy. And, in general, a person who is deliberately choosing is clearly always both deliberately choosing something and for the sake of something, the latter being something for the sake of which something else is deliberately chosen, while the former is what is deliberately chosen for the sake of something else. The end, by contrast, is what is above all wished for, and one believes that one should be healthy and do well in action. So it is evident due to these considerations that deliberate choice is something other than belief or wish; for wishing and belief are above all about the end, while deliberate choice is not.

That deliberate choice is not wish, belief, or simple supposition is clear. But how does it differ from these, and how is it related to the voluntary? It will then at the same time be clear what deliberate choice is. Among the things that are capable of being or of not being, some are such that it is possible to deliberate about them. But about some it is not possible. For some are capable of being or of not being, but their coming to be is not up to us, but rather some come to be due to nature, others due to other causes, and no one would attempt to deliberate about these unless in ignorance.

The things, however, that not only can be or not be, but that human beings can also deliberate about, are those that it is up to us to do or not to do.

That is why we do not deliberate about things in India, or about how to square the circle (for the former are not up to us, and the latter is not at all doable in action). But neither do we deliberate about all the things doable in action that are up to us (and this too makes it clear that deliberate choice is not simply belief). But the things that can be deliberately chosen and done in action are among the ones that are up to us. That is also why one might raise a puzzle as to why exactly doctors deliberate about things they have scientific knowledge of, while orthographers do not. The cause is that error arises in two ways (for we can err in rational calculation or in perception when actually doing the thing). But while in medicine it is possible to err in both ways, in orthography it is possible to do so [only] in perception and action, and if they start to investigate that, it will go on without limit. **1226^{b}1**

Deliberate choice, then, is neither belief nor wish, whether one of the two or both together (for no one deliberately chooses all of a sudden, but it does seem that acting and wishing can be sudden). Therefore, it is based on both; for both are present in one who deliberately chooses.

But how it is based on them must be investigated. In a way, however, even the name itself makes this clear; for deliberate choice (*prohairesis*) is choice (*hairesis*), not unconditionally so, but of one thing before (*pro*) another, and this is not possible without investigation and deliberation. That is why deliberate choice is based on deliberative belief.

About the end no one deliberates—instead, this is assumed by everyone—but about the things that lead to it, whether this or that conduces to it, or else, when one has a belief about that, how it will come about. And we all deliberate about this until we carry back the starting-point of the process of its coming to be to ourselves. If, then, no one deliberately chooses without prior preparation or without prior deliberation, whether for worse or better, and if one deliberates about whatever is up to us of the things that further the end that can either be or not be, it is clear that deliberate choice is a deliberative desire for things that are up to oneself. For we all deliberate about the things we also deliberately choose, although we do not deliberately choose all the things we deliberate about. I mean by a desire's being "deliberative" that deliberation is its starting-point and cause—that is, one desires because of having deliberated.

That is why deliberate choice is not present in other animals, nor in every stage of life, or every condition of human being; for deliberation is not present either, nor supposition about the why of things. But nothing prevents a belief about whether something must be done or not done from being present in many, though not yet due to rational calculation. For the deliberative part of the soul is a part capable of getting a theoretical grasp on a certain cause. For the for-the-sake-of-which is one of the causes; for the why of something is a cause and that for the sake of which something is or comes to be, this, we say, is a cause—for example, the conveyance of things is

a cause of walking, if one walks for the sake of this. That is why those who have not assumed a target are not in a position to deliberate.

So, if a person due to himself and not due to ignorance does or refrains from doing what it is up to him to do or not to do, he does it or refrains from doing it voluntarily. But we do many actions of this sort without prior deliberation or premeditation. So it necessarily follows that everything deliberately chosen is voluntary, but not everything voluntary is deliberately chosen, and that everything that is in accord with deliberate choice is voluntary, but not everything voluntary is in accord with deliberate choice.

At the same time it is evident from these considerations that legislators are correct to distinguish some happenings as voluntary, some as involuntary, some as premeditated; for even if they are not portraying things exactly, they at least touch on the truth to some extent. But we will speak about this in our investigation concerning justice.[39] As for deliberate choice, it is clear that it is not simply wish or belief, but belief and desire together, when these come to a conclusion on the basis of deliberation.

But since one who deliberates always deliberates for the sake of something, and for the person who deliberates there is always some target for the furthering of which he investigates what is advantageous, it follows that no one deliberates about the end; instead, it is rather a starting-point and hypothesis, just like hypotheses in the theoretical sciences (these were spoken about briefly at the start of these discussions, and with exactness in the *Analytics*).[40] And everyone's investigation, whether involving craft or not involving craft, bears on what furthers the end—for example, one deliberates about whether one should wage war or not. But beforehand there will indeed be the why, and this is the for-the-sake-of-which—for example, wealth, pleasure, or something else of that sort, which happens to be the for-the-sake-of-which. For the person who deliberates, if he has investigated from the perspective of the end, deliberates about how in that case to bring things back to himself, or what he himself can do to further the end.

The end is by nature always good, and what people deliberate about in particular cases (for example, the doctor might deliberate about whether to administer a drug, and the general about where to set up camp); for them the end, what is unconditionally best, is good. What is contrary to nature, on the other hand, and due to distortion, is not the good, but rather the apparent good.

The cause of this is that, among the things that are, some cannot be used for anything other than what they are naturally for—for example, sight; for it is not possible to see what is not an object of sight, nor to hear what is not an object of hearing. But from a science [it is possible] to produce what it is not the science of; for the same science is not the science of health and of disease in the same way, but of the one in accord with nature, of the other contrary to nature. Similarly, wish is by nature for

39. *NE* 1135b11–1136a9.
40. 1214b6–15, 1222b15–1223a9, *APo*. 1.2.

the good, but contrary to nature for the bad too, and one wishes by nature for the good, but contrary to nature and due to distortion, also for the bad.

But surely the destruction and perversion of a given thing are not to some random thing, but to contraries and intermediates. For it is impossible to go outside these, since deception also brings about not random things but contraries where there are such, and those contraries that are contraries in accord with the relevant science. It is necessary, therefore, that both deception and deliberate choice come about from the mean to contraries (and the more and the less are contraries to the mean). And the cause is the pleasant and the painful; for the situation is that the pleasant appears good to the soul, the more pleasant better, the painful bad, and the more painful worse. So from these considerations too it is clear that virtue and vice are concerned with pleasures and pains. For they are concerned with what can be deliberately chosen, deliberate choice is concerned with what is good and bad and what appears so, and pleasure and pain are by nature things of the latter sort.

Therefore, since virtue of character is itself both a sort of mean and always concerned with pleasures and pains, while vice lies in excess and deficiency and is concerned with the same things as virtue, it is necessary for virtue of character to be a state that deliberately chooses what, in relation to us, is a mean in pleasures and pains, that is, the ones in respect of which, as he enjoys or is pained by them, someone is said to be of a certain sort in regard to character; for the lover of sweet-tasting things or the lover of bitter-tasting ones is not said to be of a certain sort in regard to character.

2.11
Virtues, Eds, and What Furthers Ends

These things having been determined, let us state whether virtue makes deliberate choice incapable of error and the end correct, in such a way that one deliberately chooses for the sake of what one should, or whether, as certain people believe, it makes the reason correct. (But the latter is self-control; for it does not corrupt the reason. But virtue and self-control are distinct. However, these must be spoken about later on,[41] since for those, at least, to whom it seems that virtue supplies the correct reason, the cause is that self-control is this sort of thing; and self-control is one of the praiseworthy things.) But let us say [what our view is] after first raising some puzzles. For it is possible for the target to be correct, but to make errors in what furthers hitting the target; on the other hand, it is possible to be in error about the target, but to be correct about what will allow us to reach it; and it is possible for neither to be correct. Does virtue make the target correct, or what furthers hitting the target? We

41. *NE* $1150^{b}29–1151^{a}28$.

assume, of course, that it is the target, because there is neither rational calculation nor reason concerning this. Let this, then, be assumed as a starting-point.

For the doctor does not investigate whether someone should be healthy or not, but whether he should walk around or not, nor does the physical trainer look into whether someone should be in good condition or not, but whether he should engage in wrestling or not. Similarly, no other craft is concerned with the end; for just as the hypotheses are starting-points in the theoretical sciences, so too in the productive ones the end is starting-point and hypothesis. Since this is what being healthy is, it is necessary for this to be present, and for it to be present, that must be, just as in the other sphere, if a triangle is two right angles, it is necessary for this to be so. Of understanding, then, it is the end that is starting-point, but of action it is the end result of understanding.

If, then, the cause of all correctness is either reason, or if not reason, virtue, then the correctness of the end, but not of what furthers the end, would be due to virtue. And the end is the for-the-sake-of-which. For all deliberate choice is of something and for the sake of something. But the mean is a for-the-sake-of-something, of which virtue is cause, [namely, of] the deliberately choosing being for the sake of it. However, the deliberate choice is not of it, but of the things that are for its sake. Therefore, hitting on these things, whichever ones one must do for the sake of the
1228a1 end, is a task for a different capacity. But of the deliberate choice's end being correct virtue is cause. And that is why it is on the basis of his deliberate choice that we judge what sort of person someone is, that is, we judge what he acts for the sake of, not what he does.

Similarly, vice makes the deliberate choice be for the sake of the contrary things. If this person, then, when it is up to him to do noble things and abstain from doing shameful ones, does the contrary, it is clear that this person is not excellent. So it is necessary for vice to be voluntary as well as virtue; for there is no necessity to do the depraved things. That is also why vice is blameworthy and virtue praiseworthy; for one is not blamed for shameful and bad actions that are involuntary, nor is one praised for good involuntary ones, but rather for voluntary ones.

Further, we praise and blame everyone looking more toward their deliberate choice than toward their works, because people do base things under compulsion too, but no one deliberately chooses under compulsion; and yet the activity [of virtue] is more choiceworthy than virtue.

Further, because it is not easy to see what sort a deliberate choice is, we are compelled to judge on the basis of his works what sort of person someone is. So the activity is more choiceworthy, but the deliberate choice is more praiseworthy. These things follow from what has been assumed, and further, agree with the things that appear to be so.

BOOK 3

3.1
Courage

That means are present in the virtues, then, that they are deliberately choosing states, that their contraries are vices, and what these means are has been stated in universal terms. Now let us take them individually and speak of them in order.

And first let us speak about courage. It certainly seems to pretty much everyone both that the courageous person is concerned with fears and that courage is one of the virtues. And in our previous catalog[42] we distinguished rashness and fear as contraries; for these are in a way opposite to each other. It is clear, then, that those said to be what they are in accord with these states will be similarly opposed to each other—for example, the coward (for he is said to be such in virtue of being more afraid than one should and less confident than one should) and the rash person (for he too is said to be what he is in accord with being such as to be less afraid than one should and more confident than one should). That is also why he is named such paronymously; for the rash person is said to be such paronymously from rashness.

So, since courage is the best state concerned with feelings of fear and confidence, one should be neither like rash people (for they are deficient in the former and excessive in the latter) nor like cowards (for they too do the same, except not concerning the same things, but instead [act] from contrary ones, since they are deficiently confident and excessively afraid), it is clear that the mean disposition between rashness and cowardice is courage; for this is best.

The courageous person seems to be for the most part fearless, the coward fearful, and the latter seems to fear things, whether many or few, great or small, and to do so intensely and quickly, while his contrary either does not fear at all or does so slightly, slowly, and infrequently, and [only] great things. And the latter endures what is intensely frightening, the former not even what is slightly so.

What sorts of things, then, does the courageous person endure? First, is it what is frightening to himself or what is frightening to others? If, of course, it is what is frightening to another, one would say that there is nothing dignified in that. If it is what is frightening to himself, what is frightening to him would be great and numerous frightening things. But frightening things produce fear in each individual to whom they are frightening—for example, if they are intensely frightening, the fear is strong; if they are slightly so, it is weak. So the result is that the courageous person feels fears that are great and numerous, while it seemed on the contrary that courage renders one fearless, and this consists in fearing little or nothing, and those slightly or scarcely at all.

42. $1221^{a}17–19$.

But presumably things are said to be frightening, as they are said to be pleasant and good, in two ways. For some are unconditionally so, while others are so to a particular person, though not unconditionally pleasant or good, but on the contrary base and not pleasant, like the things that are beneficial to wicked people, or the ones that are pleasant to children insofar as they are children. It is the same way with frightening things, some are unconditionally so, others so to a particular person. Of the ones, then, that are frightening to the coward insofar as he is a coward, some are frightening to no one [else], while others are slightly so. But the things that are frightening to most people, and to human nature, these, we say, are unconditionally frightening. And the courageous person is fearless in relation to them, and endures frightening things of this sort, which are frightening to him in one way, and in another way not. Insofar as he is human, they are frightening; but insofar as he is courageous, they are slightly frightening, or not at all so.

However, these things are frightening; for they are frightening to most people. That is also why the state [of courage] is praised; for it is just like the case of the strong and the healthy. For these too are of the sort they are, not because no labor can wear out the one, no excess the other, but because they are affected, either not at all or [only] slightly, by what would affect ordinary people, that is, most people. Sickly people, weak people, and cowards, however, are somewhat affected also by affections that are common, except both more quickly and more so than ordinary people, and further, are affected, either not at all or [only] slightly, by what does affect ordinary people.

A puzzle arises, however, as to whether nothing is frightening to the courageous person, and whether he would never become afraid. Or does nothing prevent him from doing so in the way mentioned? For courage is a following of reason, and reason orders us to choose what is noble. That is why the person who, not due to this, endures frightening things, is either out of his senses or rash. But only the one who does so due to what is noble is fearless and courageous. The coward, then, is afraid even of what one should not fear, while the rash person is confident even about what one should not be confident about. The courageous person, by contrast, is as one should be, and in this respect is a mean; for the things reason orders, these are the ones he is both confident about and fears. But reason does not order him to endure what is greatly painful or destructive, unless it is noble to do so. The rash person, then, is confident about such things, even if reason does not order it; the coward, not even if it does order it; the courageous person alone, if it does order it.

There are five forms of courage that are so called by resemblance; for people endure the same things [as courageous people], but not due to the same causes. One is political courage, which is the courage due to a sense of shame. A second is military courage, which is due to experience and knowledge. Not, as Socrates said, knowledge of what is to be feared, but of what can help with what is to be feared. A third is the one due to lack of experience and ignorance, due to which children and mad people endure whatever comes along, and others handle snakes. Another is the courage in

accord with hope, in virtue of which both people who have often been lucky and those who are drunk endure dangers; for wine makes people optimistic. Another is due to a non-rational feeling (for example, due to love or spirit); for in fact a person in love is rash rather than cowardly and endures many dangers, like the man who killed the tyrant in Metapontum,[43] or the legendary one in Crete.[44] And when due to anger and spirit it is the same way; for spirit can drive one out of one's senses. That is why wild pigs seem courageous, without really being so; for when they are out of their senses, they behave like courageous people, and when they are not, they are capricious, like rash people. Nonetheless, the courage of spirit is the most natural; for spirit is unconquerable, which is also why the young are the best fighters. Political courage, on the other hand, is due to law. None of these, however, is truly courage, although as sources of encouragement for those in danger they are all useful.

Frightening things we have so far spoken about in general terms, but it is better to determine them more fully. In general, then, it is the things productive of fear that are said to be frightening. And such things as appear to be productive of pain that is destructive are of this sort; for those who await some other sort of pain, though they might perhaps have a feeling of pain produced in them, it will not be fear—for example, if someone foresees that he will be pained by the sort of pain that envious people are pained by, or the sort that jealous ones are, or those that feel ashamed. Fear, on the other hand, is produced only in the case of such pains as apparently will come about, the nature of which is to be destructive of life. That is also why some people who are very soft about some things are courageous, while some who are hard and resilient are cowards. **$1229^{b}1$**

Indeed, it seems to be pretty much special to courage that one be disposed in a certain way at the moment of death and the pain of it. For if one person were capable of enduring, as reason [prescribed], in the face of heat and cold and pains of this sort, which are lacking in danger, but was soft and greatly afraid in the face of death, not due to some other affection but due to its very destructiveness, while another was soft in the face of those things but unaffected in the face of death, the first would seem cowardly, the latter courageous. For in fact only those sorts of frightening things are said to be dangerous as bring close to us what is productive of destruction, and danger appears whenever they appear close.

The frightening things, then, concerning which we call a person "courageous," as was said, are those that appear to be productive of pain that is destructive—provided that these appear close rather than distant, and are, or appear to be, of such magnitude as is proportional to a human being; for there are some things that necessarily appear frightening to any human being and throw him into confusion. For just as some degrees of heat and cold, and certain other capacities, are too much for us and

43. The reference may be to Antileon of Metapontum, who assassinated Archelaus tyrant of Heraclea to rescue his boyfriend Hipparinus from the latter (Plutarch, *Moralia* 760c).
44. The reference is uncertain, but may be to Theseus, who was helped by his lover Ariadne to slay the Minotaur.

for the states of the human body, so there is nothing to prevent it being this way too as regards the feelings of the soul.

Certainly cowards and rash people are deceived due to their states; for to the coward both what is not frightening seems frightening and what is slightly frightening seems intensely so; to the rash person it is the contrary, what is frightening seems not to trouble his confidence, and what is intensely frightening seems only slightly so, while to the courageous person things most of all seem as they truly are. That is why someone is not courageous if he endures frightening things due to ignorance (for example, if someone endures showers of thunderbolts due to madness), nor, knowing the danger, if he does so due to spirit (for example, the Celts take up weapons and confront the waves, and barbarian courage in general involves spirit).

But some people endure [frightening things] due to other pleasures too. For even spirit includes a certain pleasure; for it involves the hope of revenge. Nonetheless, no one who endures [the danger of] death due to this or due to some other pleasure, or due to the avoidance of greater pain, could justly be said to be courageous on these grounds. For if dying were pleasant, intemperate people would often have died due to their lack of self-control, in just the way that, as things stand, though dying itself is not actually pleasant, there are things productive of it that are, and many knowingly do embrace it due to their lack of self-control, and not one of these would seem to be courageous, even if they were entirely ready to die. Nor is someone courageous if he dies to avoid suffering (which is precisely what many people do). As Agathon says:

> For the base ones among mortals when defeated by suffering
> Fall in love with dying.[45]

So too the poets tell the story of Chiron who, due to the pain of his wound,[46] prayed for death, though he was immortal.

In much the same way, those who endure dangers due to experience, which is pretty much the way that most people in the army endure them, are not courageous. For the contrary holds of what Socrates thought, when he thought that courage is scientific knowledge. For it is not because they know what is frightening that those with the scientific knowledge of how to climb up the masts are confident, but because they know how to help with what is to be feared. Nor is that courage due to which people fight more confidently; for then, according to Theognis, even strength and wealth would be courage: "For every man is conquered by poverty."[47] But manifestly there are some cowards who nonetheless endure danger due to their experience. And this is because they do not think it is a danger; for they know how to help with it. A sign of this is that when they think they do not have help available, but already what is to be feared is close, they do not endure it.

45. Fr. 7 Nauck.
46. Received from one of Heracles' poisoned arrows.
47. Ln. 177 Diehl.

But in the case of all these sorts of causes, the people who endure dangers due to shame are the ones who would appear most courageous, as Homer says of Hector enduring danger when facing Achilles: "And shame took hold of Hector," and "Polydamas will be the first to reproach me."[48] And this is political courage.

True courage, however, is neither this nor any of those others, but it is similar to them, as also is the courage of wild beasts, who, due to their spirit, rush to meet the blow. For one should stand one's ground when afraid not because one will incur disrepute, or due to anger, or due to not thinking one will be killed, or due to having the capacity to protect oneself (for this way one will not think there is anything at all to be afraid of).

But since every virtue is a deliberately choosing [state] (in what way we mean this was stated previously:[49] it makes us choose everything for the sake of something, and this is the for-the-sake-of-which, the noble), it is clear that courage too, because it is a virtue, will make one endure what is frightening for the sake of something, so that one does so neither due to ignorance (for virtue rather makes us judge correctly) nor due to pleasure, but because it is noble—since, if it is not noble to do so, at any rate, but mad, one does not endure it (for it is shameful to do so).

Concerning what sorts of things, then, courage is a mean, between what, and why, and what the capacity of frightening things is, has now, in accord with our present methodical inquiry, been pretty much adequately stated.

3.2
Temperance and Intemperance

We must next try to make some determinations about temperance and intemperance. The intemperate person is said to be such in many ways. For the one who has not yet been disciplined or treated is intemperate, just as a thing that has not been divided is undivided, and is either capable or incapable of being divided (for both what cannot be divided, and what can be but has not been, are undivided). And it is the same way with intemperate as well. For there is both what is not naturally receptive of discipline and what is naturally receptive of it but has not been disciplined for errors in areas in which the temperate person acts correctly (as in the case of children); for people are said to be intemperate with reference to this sort of intemperance. Furthermore, in yet another way, those who are difficult to cure or altogether incurable by discipline [are said to be so].

But though something is said to be intemperance in several ways, it is evident that the intemperate people are [all] concerned with certain pleasures and pains, and that it is in how they are disposed to these that they differ from each other and from other

48. *Iliad* 22.100. The first quotation is not in our text, but at 22.105 Hector says, "I feel shame before Trojans and the Trojan women."
49. $1227^{b}5–11$, $1227^{b}34–1228^{a}4$.

people. (We previously described[50] how we transfer the name "intemperance.") Those people who, due to insensibility, are unmoved by the same pleasures, some people call "insensible," and others call by other such names. But the affection is not at all known or commonplace, because everyone errs more in the opposite direction and because a yielding to and a perception of such pleasures is inborn in everyone. The people who are most of all of this insensible sort are the boorish ones that the comic playwrights introduce, the ones who stay clear even of moderate and necessary pleasures.

But since the temperate person is concerned with pleasures, it is necessary for him also to be concerned with certain appetites. We need, then, to grasp what these are. For the temperate person is not temperate in regard to every appetite nor to all that is pleasant but, as it seems, to two of the perceptible ones, both the objects of taste and of touch, but in truth, the object of touch; for the temperate person is not concerned with the pleasure that is due to the sight (without sexual appetite) of beautiful things, nor with the pain of ugly ones, nor with the [pleasure or pain] due to hearing what is harmonious or disharmonious, nor yet with those of smelling good or bad odors; for no one is said to be intemperate for feeling or not feeling these. At any rate, if someone looks at a beautiful statue, or horse, or human being, or listens to someone singing, not wishing to eat, or drink, or have sexual intercourse, but just to look at beautiful things or listen to people singing, he would not be thought to be intemperate, any more than those beguiled by the Sirens would.[51]

Instead, temperance is concerned with the only two sorts of perceptible objects that the various wild beasts also have perception of, and are pleased or pained by—the objects of taste and the objects of touch. But all wild beasts appear to be pretty much equally lacking in perception of the pleasures of the other perceptible objects—for example, of harmonious sound or visual beauty. For it is evident that they are not affected to any extent worth talking about by the mere looking at beautiful things or listening to harmonious sounds, unless perhaps some extraordinary case has occurred.

But neither are they affected by good or bad odors, and yet their perceptual modalities, at any rate, are all very acute. On the contrary, even in the case of odors the ones they enjoy are the ones that coincidentally, but not intrinsically, gladden them. By "non-intrinsic" I mean the odors we enjoy in anticipation or remembrance of, for example, gourmet food and drink (for the pleasure due to which we enjoy these, the pleasure of eating and drinking, is a distinct one); the intrinsic ones are, for example, those of flowers. That is why Stratonicus put it elegantly when he said that the latter smell beautiful, the former delicious. So even in the case of the pleasures of taste, wild beasts are not excited by all of them, and not by those whose perception is with the tip of the tongue, but rather only by those whose perception is with the gullet, which is a feeling more like touch than taste. That is why gourmands pray not for a long tongue, but for the gullet of a crane—as did Philoxenus, the son of Eryxis.

50. Reference is unclear.
51. Homer, *Odyssey* 12.165–200.

So, unconditionally speaking, one should assume that intemperance is concerned with the objects of touch. And indeed the intemperate person is likewise concerned with such things. For drunkenness, gluttony, gourmandizing, lechery, and everything of this sort have to do with the perceptual modalities mentioned, and these are precisely the parts into which intemperance is divided. But no one is said to be intemperate if he is excessive concerning the pleasures of sight, hearing, or smell; instead, we criticize these errors, but without serious reproach. And, in general, concerning those things where we do not speak of the self-controlled, or those who lack self-control, neither [do we speak] of intemperate or temperate ones.

A person is insensible (or in whatever way he should be named), then, who is so disposed that he is deficient in the enjoyment of the things that for the most part all necessarily share in and enjoy; while the one who is excessive is intemperate. For everyone by nature both enjoys these things and acquires an appetite for them, without being, or being called, either intemperate (for they are neither excessive by enjoying them more than they should when they get them nor by being more pained than they should when they do not get them) or insensible (for they are not deficient in their enjoyment or being pained, but lean more to being excessive).

But since there is excess and deficiency concerning these things, it is clear that there is also a mean, and this state is the best and contrary to both of them. So if temperance is the best state concerned with the things the intemperate person is concerned with, the mean concerned with the perceptible pleasures mentioned would be temperance, it being a mean between intemperance and insensibility. But the excess would be intemperance, while the deficiency is either nameless or called by the names mentioned. We will have to make more exact determinations about the relevant kind of pleasures in our later discussions concerning self-control and lack of self-control.[52]

1231b1

3.3
Mild-Manneredness and Harshness

Both mild-manneredness and harshness must be grasped in the same way; for we see in fact that the mild-mannered person is concerned with the pain that is due to spirit by being disposed to it in a certain way. And we cataloged[53] and opposed to the irascible, harsh, and savage one (for all of these sorts of things belong to the same disposition) the slavish and the foolish person. For these are pretty much the things people call those who fail to move their spirit even against those they should, but are tolerant of insulting treatment and humble in the face of contempt. For in the case of this pain that we call "spirit," slowness is the opposite of quickness, intense of slight, and being pained for a short time of being so for a long time. But

52. *EE* 6.4 (= *NE* 7.4).
53. 1220b38, 1221a15–17, 1221b12–15 (the terms used are somewhat different).

since, as we have said there is in other cases, there is excess and deficiency here too (for the harsh person is the sort that is affected more quickly, to a greater degree, for a longer time than one should, when one should not, against the sorts of people one should not, and against too many people, while the slavish person is the contrary), it is clear that there is also someone who is the mean in this inequality. Since, then, both of these other states are in error, it is evident that the mean state between these is the decent one; for it is neither too early nor too late, neither getting angry with those one should not, nor failing to get angry with those one should. So, since in fact mild-manneredness is the best state concerned with these affections, mild-manneredness too would be a certain mean, and the mild-mannered person a mean between the harsh and the slavish ones.

3.4
Generosity

Greatness of soul, magnificence, and generosity are also means. Generosity, for its part, is concerned with the acquisition and expenditure of wealth. For the person who is pleased by every acquisition more than one should, and is pained by every expenditure more than one should, is ungenerous; the one who in both cases is so less than one should is wasteful; while the one who in both is so as one should is generous. (By "as one should," both in these cases and in others, I mean "as correct reason prescribes.") But since the first two people are in excess and deficiency, respectively, and where there are extremes there is also a mean, and this is best (the best where each form is concerned being one thing), it is necessary for generosity also to be a mean between wastefulness and ungenerosity, concerning the acquisition and expenditure of wealth.

But we speak of wealth and the craft of wealth acquisition in two ways; for there is the intrinsic use of a possession, such as of a shoe or a cloak, and the coincidental use of it—not of course as when someone uses a shoe as a weight, but as, for example, selling it or hiring it out (for then it is used as a shoe). The avaricious person is the one who is eager for money, and money is concerned with acquisition rather than coincidental use. The ungenerous person, by contrast, could even be wasteful concerning the coincidental way of acquiring wealth; for it is in the case of acquiring wealth in accord with nature that he pursues increase. The wasteful person is deficient in the necessities, while the generous one gives away any surplus.

There are also forms of these states that exhibit differences that are described in terms of the more and less concerning their parts. For example, a miser, a skinflint, and a profiteer are ungenerous—the miser in not giving away money, the profiteer in accepting it from any source, and the skinflint in his intense worry about small sums. The person who is unjust in accord with ungenerosity is a keeper of false accounts and a fraud. And, similarly, one sort of wasteful person is a glutton for undisciplined

expenditure, while another keeps no accounts because he cannot endure the pain of keeping accounts.

3.5
Greatness of Soul

As regards greatness of soul, one must determine what is special to it on the basis of the qualities ascribed to great-souled people. For just as in other cases too, where due to their closeness and similarity up to a point their further divergence escapes notice, the same also happens concerning greatness of soul. That is why the contrary people sometimes lay claim to the same quality, the wasteful and the generous, the surly and the dignified, and the rash and the courageous; for they are concerned with the same things and up to a certain point are close neighbors—just as the courageous person and the rash one are capable of enduring dangers, but the former in one way, the latter in another, and these differ greatly.

We speak of the great-souled person, in accord with meriting the title conveyed by the name, as consisting precisely in a certain magnitude of soul and capacity, so that he also seems similar to the dignified person and the magnificent one. Further, greatness of soul also appears to follow along with all the virtues. For correctly judging what is great and small among good things is also something praiseworthy. Those that seem greatest are the ones pursued by the person who possesses the best state concerned with things of this sort. And greatness of soul is the best state. But the virtue concerned with a given thing judges the greater and smaller correctly, in the very way that the wise person and virtue would order. So all the virtues will follow along with greatness of soul, or it will follow along with all of them.

Further, it seems to be characteristic of a great-souled person to tend to despise things. But each virtue makes [its possessor] tend to despise great things that are contrary to reason—for example, courage does this in the case of dangers (for it thinks[54] **1232b1** that a [certain] great danger is among the shameful things, that is, that magnitude is not always to be regarded with fear), a temperate person thinks this about many great pleasures, and a generous one about many great sorts of wealth. And this seems characteristic of the great-souled person, because he is serious about few things, and these great ones, and not because they seem so to someone else. Indeed, the great-souled man would be more concerned about what seems good to one excellent person than about what seems so to many random people, as Antiphon, after his condemnation, said to Agathon who had praised his defense speech.[55] Actually, despising things seems to be above all a special affection of the great-souled person. Again, he seems to give little thought to honor, living, wealth, and the other things that human beings

54. Reading οἴεται.

55. When he was put on trial by the restored democracy for his part in the revolution of the Four Hundred in 411 BC.

take seriously, except to honor. It would pain him to be dishonored and ruled by an unworthy person, and he enjoys getting honor most of all.

He would seem, then, to be disposed in contrary ways; for to be not only most of all concerned with honor, but also to tend to despise popular reputation, seem not to go together. But in saying this we need to draw some distinctions. For honor is great or small in two ways. For it makes a difference whether the honor comes from many random people or from those worthy of note. And, again, so does that for which the honor [is conferred]. For it is great not due to the number or quality of the honorers alone, but also due to its being [conferred for something] estimable. In truth, even positions of rule and the other good things are estimable and worth taking seriously only if they are truly great, so that there is also no virtue without greatness. That is why, as we said,[56] each of the virtues seems to make people great-souled with regard to that with which each of them is concerned.

Nonetheless, beyond the other virtues, there is a particular one that is greatness of soul, so that it must be stated that the person having this one is actually in the special sense great-souled. But since some good things are estimable, while others are not, and of these sorts of goods some are truly great, others small, and of the former some people are worthy, and think themselves worthy, it is among them that the great-souled person is to be sought.

It is necessary, however, to draw a fourfold distinction. For one can be worthy of great things and think oneself worthy of them, plus there are small things and one can be worthy of things of that size and think oneself worthy of them, and there is the reverse in relation to each of these. For one could be such as to be worthy of small things while thinking oneself worthy of great and estimable goods, and one could be worthy of great ones while thinking oneself worthy of small ones. The one who, though worthy of small things, thinks himself worthy of great ones is blameworthy (for he is foolish and it is no noble thing to think oneself worthy of getting what is contrary to one's worth). But that person is also blameworthy who, though worthy of such things, does not think himself worthy to partake in them, even though they
1233a1 are available to him. There remains, then, the person who is contrary to both of these—the one who is worthy of great things and thinks himself worthy of them, and is such as he thinks himself to be. He is praiseworthy and a mean between them.

Since, then, concerning the choice and use of honor and other estimable goods, the best disposition is greatness of soul, and we define the great-souled person as concerned with these, and not as concerned with useful things, and since at the same time too the mean disposition is most praiseworthy, it is clear that greatness of soul would also be a mean disposition. And of its contraries, just as we cataloged them,[57] the one of thinking oneself worthy of great things when one is not worthy of them is conceit (for we say that those sorts of people are conceited who think themselves

56. 1232a39–b4.
57. 1221a10, 31–32.

worthy of great things without really being so), and the one having to do with really being worthy of great things while thinking oneself not worthy of great ones is smallness of soul (for it seems to be characteristic of a small-souled person not to think himself worthy of anything great, although the things due to which he would justly be thought so are available). So it is necessary for greatness of soul too to be a mean between conceit and smallness of soul.

The fourth of the cases we distinguished is neither altogether blameworthy nor is he great-souled, since he is concerned with nothing having greatness; for he is neither worthy nor thinks himself worthy of great things, which is why he is not contrary [to the great-souled person]. And yet it would seem that being worthy of small things and thinking oneself worthy of them is contrary to being worthy of great things and thinking oneself worthy of them. But this person is not contrary [to the great-souled person] nor to be blamed (for he is as reason prescribes). And he is by nature the same as the great-souled person (for both think themselves worthy of the things they are worthy of). Indeed, he might even become great-souled (for he will think himself worthy of what he is worthy of), while a small-souled person, who, when great goods that are in accord with his honor are available, does not think himself worthy of them, what would he have done if he had been worthy [only] of small ones? For either he would have thought himself worthy of great ones and been conceited, or of still smaller ones. That is also why no one would say of someone who was a resident alien that he was small-souled, if he thought himself unworthy to rule, but instead submits to it, but rather he would say it of someone who was a well-born citizen and thought it a great thing to rule.

3.6
Magnificence

The magnificent person too, for his part, is not concerned with any random action or deliberate choice, but with expenditure, unless perhaps we are speaking metaphorically. And without expenditure there is no magnificence; for it is what is appropriate in adornment, and adornment does not come from random expenditures, but is found in exceeding the necessities. The person, then, who in great expenditure is disposed to deliberately choose what is appropriately great and this sort of mean, and is desirous of this sort of pleasure, is magnificent.

The one who is disposed to greater and inappropriate expenditure is nameless. Nonetheless, he has a certain affinity with those whom some people call "tasteless" and "pretentious." For example, if someone who is rich is spending money on the **1233b1** wedding of his beloved,[58] and it seemed to him to be appropriate to make the sort of preparations one would make for a feast of moderate drinkers, he would be niggardly,

58. I.e., the one who used to be his boyfriend.

while one who receives guests of the latter sort in a way appropriate for a wedding feast, if he does it neither for the sake of reputation nor due to resources, would be similar to a pretentious person.

But the one who spends in accord with worth and as reason prescribes is magnificent; for the appropriate [amount] is in accord with worth; for none of the things that are contrary to worth is appropriate. And [the amount] must be appropriate—for what is appropriate is in accord with worth and what is in accord with worth is appropriate—and appropriate both in relation to the thing (for example, what is appropriate for the wedding of a servant is distinct from what is appropriate for that of a beloved), and for the person himself, if indeed he is up to this much or this sort of thing (for example, the embassy that Themistocles conducted to the Olympic Games was not thought appropriate for him, because of his former low status, but rather for Cimon).

But the person who has a random attitude to worth is none of these. And in the case of generosity it is the same way; for a person may be neither generous nor ungenerous.

3.7
Other Good and Bad States of Character

For their parts, pretty much all of the other praiseworthy or blameworthy states concerned with character are also either excesses, deficiencies, or means in feelings—for example, the envious person and the one who rejoices at another's doing badly. For these are named in accord with their states: envy is being pained at those who, in accord with their worth, are doing well; the feeling of the one who rejoices at another's doing badly has no name, but the one who has it reveals it in rejoicing at those who, contrary to their worth, are doing badly. The indignant person (*nemesêtikos*) is a mean between these; what the ancients called "indignation (*nemesis*)" is being pained at those who, contrary to their worth, are doing badly or doing well, while rejoicing at those doing so in accord with their worth. That is why people think that Nemesis is actually a god.

A sense of shame is a mean between shamelessness and bashfulness; for the one who gives thought to no one's opinion is shameless; the one who gives thought to everyone alike is bashful; and the one who gives thought to the opinion of those who appear decent has a sense of shame.

Friendliness is a mean between enmity and flattery; for the one who in every case readily adapts to the appetites of his associates is a flatterer; the one who collides with all of them is churlish; and the one who neither goes along with nor resists every pleasure, but goes along with what appears best, is friendly.

Dignity is a mean between surliness and being ingratiating; for the one who lives with no regard at all to another, but rather tending to despise people, is surly; the

one who has regard to another in all things, or even feels inferior to everyone, is ingratiating; and the one who does this in some cases, but not in others, and to those worthy of it, is dignified.

The truthful and candid person, whom people call "straightforward," is a mean between the self-deprecator and the boaster. For the one who, not out of ignorance, is deceptive about himself for the worse is a self-deprecator; the one who is so for the **$1234^{a}1$** better is a boaster; and the one who represents himself as he is, is truthful, and, as Homer puts it, sagacious.[59] And, in general, one is either a lover of truth or a lover of falsehood.

Wit too is a mean, and the witty person a mean between the boorish and unwitty person and the buffoon. For just as the fussy eater differs from the omnivorous one concerning nourishment in that the former accepts nothing or only a little and does so reluctantly, while the other accepts everything readily, so too the boorish person stands in relation to the unrefined buffoon; for the former accepts nothing funny except reluctantly, while the other accepts everything readily and with pleasure. But one should do neither. Instead, one should accept some things, not others, and in accord with reason. This is the witty person.

And the demonstration is the same; for indeed wit of this sort, and not the one we speak of by transference, is the most decent state; and the mean is praiseworthy, while the extremes are blameworthy. But since wit is of two varieties (for one consists in enjoying a joke, even one directed against oneself, provided it is of this sort (the jibe included), while the other consists in being capable of producing things of this sort, though they are distinct from each other, both are means. For the good judge of one who can produce jibes of the sort that gives him pleasure, even if the joke is on him, will be a mean between the unrefined person and the one who is prim. This defining mark is better than the one saying that the jibe must not be painful to the one who is the butt of it, no matter of what sort he is. Rather, it should please the one in the mean; for he is the one who judges well.

Though all these means are praiseworthy, they are not virtues, nor are their contraries vices; for they are without deliberate choice. All of them are found in classifications of the feelings; for each is a certain feeling. But because they are natural they contribute to the natural virtues; for, as will be said in later discussions,[60] each virtue in a way occurs both by nature and otherwise, that is, as involving practical wisdom. Thus, while envy contributes to injustice (for the actions that stem from it are directed toward another) and indignation to justice, a sense of shame contributes to temperance (which is why people define temperance as being included in this kind); and the truthful and false are respectively wise and foolish.

The mean is more contrary to the extremes than those are to each other, because it **$1234^{b}1$** does not occur with either of them, while the extremes often occur with each other.

59. E.g., *Iliad* 3.203, *Odyssey* 3.52.
60. *NE* $1144^{b}1$–17.

And sometimes the same people are rash cowards, or wasteful in some things and generous in others, and, in general, uneven in a bad way. For when people are uneven in a good way, they become means; for the extremes are in a way present in the mean.

But the contrariety between the extremes and the mean does not seem to be alike for both, but sometimes is with respect to excess, sometimes with respect to deficiency. The causes of this are the two first mentioned, rarity (for example, of those insensible to pleasure), and the fact that the one we tend to err more toward seems more contrary to the mean. But a third is that what is more similar to the mean appears less contrary to it—for example, rashness in relation to courage, wastefulness in relation to generosity.

The other praiseworthy virtues, then, have pretty much been spoken about.

Books 4–6* = Nicomachean Ethics *Books 5–7

BOOK 7

7.1
Friendship

As regards friendship, what it is and what sort of thing it is, who a friend is, whether something is said to be friendship in one way or in many ways (and, if in many ways, in how many), further, how a friend must be treated, and what the just is that is fitted to friendship—these things are no less to be investigated than what is noble and choiceworthy where character traits are concerned. For indeed it seems to be most of all the work of politics to produce friendship—even virtue, people say, is useful because of this (for it is not possible for those treated unjustly by each other to be friends with one another). Further, we all say that the just and the unjust have most of all to do with friends; and it seems that the same person is both a good man and a friend, that friendship is a state of character, and that, if one wishes to make it so that people do not commit injustice to each other, one must make them friends; for true friends do not commit injustice. But then again, if they are just they will not commit injustice. Therefore, justice and friendship are either the same thing or close to it.

In addition to these considerations, we suppose that a friend is one of the greatest goods, and that friendlessness and isolation are most terrible, because our entire life and our voluntary social interactions involve friends; for we spend our days with members
1235a1 of our household, with family members, or with companions. And private acts of justice, the ones that are in relation to friends, are the only ones that are up to us, while those that are in relation to other people are ordained by law and are not up to us.

There are many puzzles about friendship. First, there are the ones raised by those who bring in considerations from outside and speak in too general terms; for to some it seems that like is friend to like. Hence the sayings: "A god ever draws like to like,"[61] and indeed "Birds of a feather flock together," and "Thief knows thief, and wolf knows wolf."

Natural scientists even arrange the whole of nature by taking as a starting-point that like goes to like (which is why Empedocles also said that the dog was sitting on the tile because they were very alike[62]). It is in this way, then, that they speak of what is a friend. But others say that contrary is friend to contrary. For a loved object or an appetitively desired one is a friend to everyone, and the dry has an appetite not for the dry but for the wet. Hence the sayings: "Earth is in love with rain,"[63] "Change in all things is sweet"[64] (and change is change to the contrary). And like is enemy to like. For "potter hates potter,"[65] and animals that are nourished from the same sources are enemies to each other. Certainly these suppositions, then, are at variance to this extent. For some hold that what is like is a friend, and what is contrary an enemy:

> The less is ever enemy to the more
> And starts a day of hate.[66]

Further, even the places of contraries are separated, while friendship seems to bring things together. But others hold that contraries are friends, and Heraclitus[67] criticizes the poet who wrote, "May strife perish from among gods and humans";[68] for there would not be any harmony without high and low, nor animals without female and male, which are contraries.

These, then, are two beliefs about friendship, which are overly universal and this much separated. But there are also others that are even closer and more akin to the things that appear to be so. For it seems to some people that it is not possible for base people to be friends, but only for good ones, while to others it seems absurd for mothers not to love their children (for it is evident that love is present even in wild beasts; at any rate, they choose to die for their children). To other people it seems that only the useful is a friend. A sign of this is that everyone in fact pursues what is useful and throws away what is useless, even if it is their own (as Socrates the elder used to say, when throwing away spit, hair, and nail clippings), that is, we dispose of the parts that are useless, and in the end, the body, when it is dead (for the corpse is useless). On the other hand, those to whom it seems useful preserve it, as in Egypt. **1235b1**

61. Homer, *Odyssey* 17.218.
62. Either alike in color or because the tile was imbued with the dog's odor.
63. Euripides, Fr. 698 Nauck.
64. Euripides, *Orestes* 234.
65. Hesiod, *Works and Days* 25.
66. Euripides, *Phoenician Women* 539–540.
67. A22, B8 DK.
68. Homer, *Iliad* 18.107.

All these views certainly seem in conflict with each other. For indeed like is useless to like, and contrariety is very far removed from likeness, and contrary most useless to contrary (for contrary is destructive of contrary). Further, it seems to some people that it is easy to acquire a friend, while to others it seems a very rare thing to know one, and not possible to do so without bad luck (for everyone wishes to seem to be a friend to those who are doing well). But others think that not even those who stand by us in cases of bad luck are to be trusted, on the supposition that they are deceivers and just pretending, in order that, through associating with the unlucky, they will acquire their friendship when their good luck returns.

7.2
Nature and the Kinds of Friendship

We must get hold of an account, then, that will at the same time give us the best account of the things that seem to be so about these issues and resolve the puzzles and the contrary positions. And this will occur if it is seen that the contrary things are reasonably held; for an account of this sort will be most of all in agreement with the things that appear to be so. And it happens that the contrary positions will stand if what is said is true in one way, but not true in another.

There is also a puzzle as to whether the object of love is the pleasant or the good. For if we love what we have an appetite for (and sexual love is especially like this; for no one is "a lover who does not love forever"[69]), and appetite is for the pleasant, then, in that case, the object of love is the pleasant. On the other hand, if the object of love is what we wish for, it is the good. But the pleasant and the good are distinct.

As regards these issues and others related to them, we must try to draw distinctions, taking the following as a starting-point: the object of desire and of wish is either the good or the apparent good. That is why the pleasant too is an object of desire; for it is an apparent good; for some people believe it is good, while to others it appears good even if they believe it is not; for appearance and belief are not in the same part of the soul. However, that both the good and the pleasant are fitted to friendship is clear.

With this determined, another assumption must be grasped. For some goods are unconditionally good, while others are good for a particular person but not unconditionally good. And the same things are unconditionally good and unconditionally pleasant. For we say that what is good for a healthy body is unconditionally good for a body, while we do not say this about what is so for a sick one—for example, drugs and surgery. Similarly, what is pleasant for a healthy and sound body is unconditionally pleasant—for example, seeing in the light and not in the dark (and yet for someone suffering from conjunctivitis it is the opposite). And a

69. Euripides, *Trojan Women* 1051.

more pleasant wine is not the one that is so to the person whose tongue has been destroyed by drunkenness (since sometimes these, at any rate, add sour wine to it), but rather what is so to a perceptual modality that is not destroyed. It is likewise **1236^{a}1** too in the case of the soul, that is, it is not unconditionally pleasant what is so to children or wild beasts, but what is so to mature adults. At any rate, when we remember both, we choose the latter. And as a child or a wild beast stands to a mature adult, so the base and foolish person stands to the decent and practically 5 wise one. And to these the things in accord with their states are pleasant, and these things are the ones that are good and noble.

Since, then, things are [said to be] good in several ways (for we say that one thing is good because it is of a certain quality, another because it is beneficial and useful), and further, since the pleasant is, in the one case, unconditionally pleasant and unconditionally good and, in the other, pleasant to a particular person or an 10 apparent good, and just as even in the case of inanimate things it is open to us to choose something and love it because of each of these, so it is too with a human being. For we can choose and love one for being of a certain quality and because of virtue, another because he is beneficial and useful, and another because he is pleasant and because of pleasure. He becomes a friend, then, whenever being loved he loves in return, and neither of them in any way fails to notice this. 15

It is necessary, therefore, for there to be three forms of friendship, and not all said to be such with reference to one thing, or as forms of a single kind, or altogether homonymously. For they are said to be friendships with reference to one primary form, as with medical; for we say that a soul, a body, an instrument, and a work 20 are medical, but it is the primary one that is said to be so in the strict sense. And primary is that whose account is present in all cases. For example, a medical instrument is one the doctor would use, but the account of the instrument is not present in that of the doctor.

In every case, to be sure, what is primary is what is sought. And because the universal is primary, people also assume that the primary is universal. But this is false. 25 So as regards friendship too they cannot account for all the things that appear to be so. For when a single account does not fit [all], they think that the others are not friendships. But they are, although not in the same way. But when primary friendship does not fit, on the supposition that it is universal, if indeed it is primary, they claim 30 that the others are not in fact friendships at all.

But there are many forms of friendship. Indeed, this was already stated, since three ways were distinguished[70] in which something is said to be friendship. For one was distinguished as being because of virtue, another as being because of utility, and another as being because of pleasure.

Among these, the friendship because of utility is that of the largest number of people; for people love each other because, and to the extent that, they are useful, as 35

70. 1236^{a}16.

the proverb says, "Glaucus, a man is a friend so long as he fights in the battle,"[71] and "the Athenians no longer know the Megarians."[72] On the other hand, the friendship characteristic of the young is because of pleasure (for this is what they have perception of). That is why the friendship of young people is easy to change; for when their characters change as they grow up, so too does what is pleasant. But the friendship **1236b1** that is in accord with virtue is that of the best people.

It is evident from these considerations that the primary form of friendship, that of good people, is reciprocal friendship and reciprocal deliberate choice with regard to each other. For to one who loves, the object of love is an object of friendship, and a friend, to the object of love, is when the love is also reciprocal.[73] This form of friendship, then, is surely found only among human beings (for they alone perceive deliberate choice). But the other forms are also found among beasts; and it is evident that utility is present to some small extent among them both in relation to humankind, in the case of domestic animals, and in relation to each other—for example, Herodotus says[74] that the crocodile bird is useful to the crocodile, and as prophets say of the associations and dissociations of birds.[75]

Also, base people could be friends with each other both because of utility and because of pleasure. But because the primary form is not present among them, [some] people say that they are not friends; for a base person will of course do injustice to a base person, and those who suffer injustice are not friends to each other. But it is not the case that they are not friends at all, though their friendship is not of the primary form, since nothing indeed prevents it from being of the other forms. For they put up with each other because of pleasure, even when they are harmed, as if they lacked self-control. But those who love each other because of pleasure do not seem to be friends either, when inquired into with exactness, because it is not the primary form; for the latter is stable, the former unstable. It is friendship, however, as has been said,[76] although not of the primary form, but derived from it.

To speak of friendship in that way only, then, is to do violence to the things that appear to be so, and makes it necessary to state unacceptable things. But it is impossible for all of them to be friendships in accord with a single account. The possibility that remains, therefore, is this: in one way, only the primary form is friendship, but in another way all are—not homonymously and having a random relationship to each other, nor in accord with one form, but rather with reference to one [form].

But since the same thing, and at the same time, is unconditionally good and unconditionally pleasant, provided nothing impedes it, and the true friend and the one that is unconditionally a friend is the primary one, and the one choiceworthy

because of himself is of this sort (and it is necessary for him to be of this sort; for one wishes good things to exist for someone because of himself, so it is necessary also to choose for him to exist), the true friend is also unconditionally pleasant. That is why, indeed, it seems that any sort of friend is pleasant.

But we must draw further distinctions about this; for there is something to give us pause: Is it the good for oneself or the unconditional good that is loved? And is it that active loving involves pleasure, so that the object of love is also pleasant, or not? For one must bring both together to the same [resolution]; for indeed what is not unconditionally good but could turn out bad is worth avoiding. And what is not good for oneself is nothing for oneself. But this is what one is seeking, namely, for unconditionally good things to be good in this way. For what is unconditionally good is [unconditionally] choiceworthy, while what is good for oneself is choiceworthy for oneself. One must harmonize these. And that is what virtue does. And politics sees to this, in order that it might come about in those in whom it has not yet done so.

Moreover, as a human being, one is well adapted and *en route* to this; for things that are unconditionally good are by nature good for oneself.[77] But the route is via the pleasant; and what is noble is of necessity pleasant. But when these are in discord, one is not yet completely excellent; for it is possible for lack of self-control to arise; for the discord between the good and the pleasant in one's feelings is lack of self-control.

So, since the primary form of friendship is in accord with virtue, the friends themselves will also be unconditionally good. And this not because they are useful, but in another way; for what is good for this person and good unconditionally are two different things. And similarly, as it is in the case of the beneficial, so it is too in the case of states; for what is unconditionally beneficial and what is so for someone are distinct, for example, physical training from being treated with drugs. So too for the state of character, human virtue. For let it be the case that the human being is among the things that are excellent by nature; for the virtue of something that is excellent by nature is unconditionally good, while that of something that is not is so [only] for it. The like holds, then, with the pleasant.

Here, indeed, is where we must pause and investigate whether there is friendship without pleasure, and what difference it makes, and in which of the two the loving consists. Is it because he is good, even if he is not pleasant, but not because of this? Loving, of course, is said in two ways;[78] is it, then, because it is good that active loving appears not to occur without pleasure? It is clear that just as fresh episodes of contemplation and learning are especially perceived because of their being pleasant, so it is too with recognitions of those we are friends with. And the same account applies to both cases. By nature, at any rate, the unconditionally good is unconditionally pleasant, and it is pleasant for those it is good for. That is why like things enjoy each other immediately, and a human being is the most pleasant thing for a human being.

77. Accepting the seclusion of ὁμοίως … ἀφυοῦς.
78. As an activity and as a state.

So, since this is so even for an incomplete person, it is clear that it is so for one that has been completed. And the excellent person is complete.

But if active loving is a reciprocal deliberate choice, involving pleasure, of getting to know each other, it is also clear that, in general terms, the primary form of friendship is a reciprocal deliberate choice of unconditionally good and pleasant things, because they are good and pleasant. And friendship itself is the state that this sort of deliberate choice stems from. For its work is an activity, and this is not external, but within the lover himself, while the work of every capacity is external; for it is either in something else or in something insofar as it is something else. That is why loving is enjoyable, but being loved is not enjoyable. For while being loved is the activation of what is beloved, loving is in fact the activation of friendship, and while the latter occurs [only] in animate things, the former also occurs in inanimate ones; for even inanimate things can be loved.

But since active loving is treating the beloved as beloved, and a friend is beloved by his friend as a friend, and not insofar as he knows music or knows medicine, the pleasure from a friend, therefore, is due to him insofar as he is himself, and this is the pleasure fitted to friendship. For [the lover] loves *him*, not because he is something else.[79] So, if he does not enjoy him insofar as he is good, it is not the primary form of friendship. Nor should any of his coincidental qualities impede more than his goodness gladdens. For if someone smells very bad, he gets left; for his goodwill is liked, but one does not live together [with him].

This, then, is the primary form of friendship, which all agree on. And because of it the others seem not only to be forms of friendship but are also disputed about. For friendship seems to be something stable and only the primary form is stable. For a formed judgment is stable, and things that do not come about quickly or easily make the judgment correct. And without trust friendship is not stable, and trust takes time. For one must put a person to the test, as Theognis too says:

> For one could not know the mind of man or woman
> Until you put it to the test, just as with a beast of burden,[80]

nor without time there is there a friend. But people wish to be friends, and it is this sort of state that one most easily mistakes for friendship; for when people are eager to be friends, because they perform all the services fitted to friendship for each other, they think that they do not [just] wish to be but are friends. But what happens in other cases also happens in the case of friendship. For it is not the case that if people wish to become healthy, they become healthy, so neither is it the case that if they wish to be friends, they immediately are in fact friends. A sign of this is that those who are disposed in this way easily believe slander [about each other] without a test, while about matters concerning which they have given a test to each other, they

79. I.e., knowledgeable about music or whatever.
80. Lns. 125–126 Diehl.

do not easily believe slander, but about matters concerning which they have not, they are persuaded when the slanderers state signs of it.

At the same time, it is evident that this [primary] form of friendship does not exist at all among base people; for the base person is untrustworthy and cynical toward everyone; for he measures others by himself. That is why good people are more easily deceived, unless due to a test they are mistrustful. And base people choose things that are by nature good in place of their friend, and none of them loves a person more than things. So they are not friends. For it is not in this way that the things of friends become common possessions; for the friend is assigned to the class of things, not the things to the friends.

The primary form of friendship, therefore, does not come about with many people, because it is difficult to put many to the test; for one would have to live with each of them. Nor, then, must one choose a cloak and a friend in the same way, and yet it seems characteristic of the person with understanding to choose the better of two things in every case: if one has been wearing the worse cloak for a long time, and has not yet worn the better one, one must choose the latter, but one must not choose instead of the long-time friend the unknown person, if he is better; for a friend is not to be had without a test nor in a single day, but rather time is needed. That is why "the bushel of salt" came to be proverbial.[81] At the same time he must not be unconditionally good only, but also good for you, if indeed he is going to be a friend to you. For someone is unconditionally good by being good, but he is a friend by being good for another, and unconditionally good and a friend when both are in harmony, so that what is unconditionally good is the same for another, but if not, then unconditionally for the excellent person and good for another because he is useful. And being a friend to many at the same time prevents one from [active] loving; for it is impossible to be active toward many at the same time.

From these considerations it is evident that it is correct to say that friendship is something stable, just as happiness is something self-sufficient. And it has been correctly said that "nature is stable, but wealth is not"[82] (though it is much better to say that virtue is than that nature is). Also, time is said to reveal who is loved, and strokes of bad luck to do so more than strokes of good luck. For it is then clear that the things of friends are common possessions, since it is only friends of the sort who, instead of things that are by nature good or by nature bad (which are what good as well as bad strokes of luck have to do with), choose a person rather than that some of these things exist or do not exist. And bad luck reveals those who are not real friends but just happen to be so because of utility. Time reveals both; for not even the useful person is revealed quickly [as not being a real friend], but rather the pleasant one is (except for the unconditionally pleasant one, who is

81. People have to share many meals (and so the salt involved) with each other before they become friends.
82. Euripides, *Electra* 941.

not revealed quickly either). In fact, people are like wines and foods. For though time quickly reveals, indeed, that some of them are pleasant, with more time they become distasteful and not sweet; and the case of human beings is similar. For what is unconditionally pleasant must also be determined by the end and by time. And even ordinary people would agree with this, and not only on the basis of after-effects, but as in the case where they call a drink "too sweet"; for it is not because of its aftereffects that they call a drink "not pleasant," but because it does not continue [to be pleasant], although it deceives at first.

The primary form of friendship, then, and the one because of which the others are so called, is the one in accord with virtue, and because of the pleasure of virtue, as was said previously.[83] The other forms of friendship are even found in children, wild beasts, and base people. Hence the sayings, "People of the same age delight each other,"[84] "Bad to bad by pleasure's fused."[85] Moreover, it is possible even for base people to be pleasant to each other, not insofar as they are base or neither [base nor good], but (say) as both being musicians, or one a music lover and the other a musician. And insofar as all have something good in them in this respect they fit in with each other. Further, they could be useful and beneficial to each other, not unconditionally but relative to their deliberate choice, or insofar as they are neither [base nor good].

1238b1 Moreover, it is possible for the decent person to be friends with a base one. (For there is utility relative to the deliberate choice: the base person is useful relative to the present deliberate choice of the excellent person, the excellent person is useful relative to the present deliberate choice of the person who lacks self-control, but useful to the base person only relative to the deliberate choice in accord with nature.) And he will wish good things for him, unconditionally wishing unconditionally good ones, but wishing on the basis of a hypothesis for the ones that are good for him (insofar as one might be advantageous in poverty or disease), and wishing these for the sake of what is unconditionally good (in the way that drinking the medicine itself in fact is; for one does not wish for it [unconditionally], but rather wishes it for the sake of this [good]).

Further, in these ways those who are not excellent could also be friends with each other; for one could be pleasant to the other not insofar as he is base, but insofar as he shares in something common, for example, if he is musical. Further, they could be friends insofar as there is something decent in everyone (which is why some might be glad to associate with an excellent person), or insofar as they fit in with each other; for all possess something of the good.

83. 1236b2–1237b7.
84. Source unknown.
85. Euripides, *Bellerophon*, Fr. 298 Nauck.

7.3
Friendship and Equality

There are, then, these three forms of friendship. And in all of these, friendship is in a way said in accord with equality; for even those who are friends in accord with virtue are in a way friends with each other by equality in virtue.

But there is another difference among these that is in accord with superiority, as the virtue of a god is in relation to a human being. For this is a distinct form of friendship. And so, in general, is that of ruler and ruled, as what is just is also distinct; for the equality is proportional and not arithmetical. Within this kind is father in relation to son, benefactor in relation to beneficiary; and there are differences among these too; for that of father in relation to son and that of husband in relation to wife are distinct, the latter being that of ruler to ruled, the former that of benefactor to beneficiary. In these friendships there either is no reciprocal loving present, or not in the same way. For it would be ridiculous if someone were to reproach the god, because he does not reciprocate love in the same way as he is loved, or for the ruler and the ruled; for being loved, not loving, is characteristic of the ruler, or loving in another way. And no less does the pleasure of a self-sufficient person in his own possessions or his child differ from that of a needy person in what he acquires.

It is the same way both in the case of those who are friends because of utility and in the case of those who are so because of pleasure. Some are in accord with equality, others in accord with superiority. That is also why those who think they are friends in the former way blame their friends if they are not similarly useful and do not do them similar good, and the same applies in the case of pleasure. This is clear in sexual relationships; for this is the cause of their fighting often with each other. For the lover is ignorant of the fact that, in the case of desire's eagerness, the ratio is not the same for them. That is why Eunicus said, "You speak like a beloved, not a lover."[86] But lovers think the ratio is the same.

7.4
Friendship between Unequals

As was said,[87] then, there are three forms of friendship—in accord with virtue, in accord with utility, and in accord with pleasure—and these are again divided into two; for some are in accord with equality, others in accord with superiority; but, though both are friendships, friends are the ones in accord with equality; for it would be strange if a man were a friend of [his] child, though he certainly loves him and is loved in return. Sometimes, however, the superior partner should be loved, but if he **1239ᵃ1**

86. 1.781 Kock.
87. Most recently at 1238ᵇ14.

loves, he is reproached for loving someone unworthy; for he is measured by the worth of his friends and by a sort of equality.

Some people, then, are unworthy of being similarly loved because of age, others in accord with virtue, or family, or some other sort of superiority. But people always think it fitting for the superior—whether in utility, in pleasure, or in accord with virtue—to love less or not at all. But where the degree of superiority is small, disputes predictably arise (for in some cases what is small has no strength at all, as in weighing wood, but in the case of gold it does). People, though, are bad at judging what is small; for one's own good appears large because it is close at hand, while another person's appears small because it is far off. But whenever the degree [of superiority] is excessive, not even the inferior parties themselves demand that they should be reciprocally loved, or be reciprocally loved in a similar way—for example, suppose someone expected the god [to do so]! So while it is indeed evident that they are friends when on equal terms, there could be reciprocal loving without their being friends.

On the other hand, it is clear why human beings seek the friendship that is in accord with superiority rather than with equality; for in this way they can both be loved and maintain superiority. That is why the flatterer is held in higher esteem than the friend by some people (for he appears to provide both to the one he flatters). And honor-lovers are most of all people of this sort; for to be admired is to be in a position of superiority. And by nature some people are disposed to friendship while others are lovers of honor. And the person disposed to friendship is the one who enjoys loving more than being loved, while the other loves honor more. He, then, who in fact enjoys being admired and loved is a friend of superiority, while the one disposed to friendship is a friend of the pleasure that lies in loving; for it is necessarily present in its being active; for being loved is something that befalls one. In fact it is possible to be unaware of being loved, but not to be unaware of loving.

And loving is more in accord with friendship than being loved, while being loved is more in accord with the object of love. A sign of this is that the friend, if he cannot have both, would choose to know the other rather than to be known, as women do when they give away their children to others, and Andromache does in Antiphon's play.[88] For wishing to be known seems to be for one's own sake, and for the sake of receiving something good, but not doing it, while knowing the other is for the sake of doing and loving. That is also why we praise those who remain loving toward the dead; for they know, but are not known.

1239b1

It has been stated, then, that there are several modes of friendship, how many they are (three), and that being loved, being loved reciprocally, and the friends (both those that are in accord with equality and those that are in accord with superiority) are different.

88. The play referred to is lost, but in Euripides' *Andromache*, Andromache sends away her son to prevent him from being killed.

7.5
Friendship and Likeness

But since friend is also said of things in a more universal way, as was also stated at the start,[89] by those who bring in considerations from outside (for some say that what is like is a friend, others the contrary), we must also speak about how these are related to the forms of friendship that were mentioned.

Likeness is referred back both to the pleasant and to the good. For the good is simple, while the bad is multiform. And the good person is always the same, and his character does not change, while the base one, or the foolish one, is not at all the same in the morning as in the evening. That is why base people, unless they make contracts, are not friends, but are at variance. And a friendship that is not stable is no friendship. So in this way what is like is a friend, because what is good is like itself. But in a way it is also in accord with the pleasant; for the same things are pleasant for those who are alike, and each is by nature pleasant to itself. That is also why the voices, states, and pastimes of those who are of the same kind are most pleasant to each other, as also in the case of the other animals. And it is in this way that it is possible even for base people to love each other.

But contrary is friend to contrary as being useful; for what is like is useless to itself. That is why master needs slave and slave master, and wife and husband need each other. And what is contrary as being useful is pleasant and an object of appetite, not as included in the end but as furthering the end. For when one gets what one has an appetite for, one is at the end and does not desire the contrary, in the way the hot desires the cold and the wet desires the dry.

But in a way even friendship for what is contrary is for the good; for the parties desire each other because of the mean; for as two halves of the same coin they desire each other because in this way a single mean comes about from both.

Further, the desire is coincidentally for the contrary but intrinsically for the mean. For contraries desire not each other but the mean. For if those that are very cold are heated they settle into the mean condition, as do the very hot if they are cooled, and it is the same way too in the other cases. Otherwise, they will always be in a state of appetitive desire, because not in the mean conditions. But the person who is in the mean condition, without appetitive desire, is enjoying what is by nature pleasant, while the others enjoy everything that takes them out of the natural state. This form [of friendship], then, exists even in inanimate things, but loving comes about when it exists in animate ones. That is why people sometimes enjoy what is unlike them—for example, serious people enjoy witty ones, and quick-tempered people enjoy easy-going ones; for they are brought into the mean condition by each other. Coincidentally, then, as was said,[90] contraries are friends, and are so because of the good. **1240ᵃ1**

89. 1235ᵃ4–30.
90. 1239ᵇ32.

How many forms of friendship there are, then, and what the differences are in accord with which people are said to be friends, or to be lovers and beloveds, both when this constitutes friendship and when it does not, have now been stated.

7.6
Self-Friendship (Self-Love)

Whether or not one is a friend to oneself requires much investigation. For to some people it seems that each person is most of all a friend to himself, and they make use of this as a standard by which to judge the friendship in relation to other friends. But according to the arguments and the things believed to be characteristic of friends, the two are in some respects contrary, and in others manifestly alike. For in a way this friendship is friendship by analogy, but not unconditionally friendship; for the being loved and loving are present in two distinct things. That is why he is a friend to himself more in the way that the person who lacks self-control, and the person who is self-controlled, are said to act in a way voluntarily and in a way involuntarily, due to the fact that the parts of the soul stand in some sort of relation to each other. And all cases of this sort are alike, whether someone is a friend to himself or an enemy, and whether he does injustice to himself; for all these are present in two distinct things. Insofar, then, as the soul too is in a way two things, these relations do in a way belong to it, but insofar as the things are not distinct, the relations do not belong to it.

And from a person's state in relation to himself the other modes of friendship—the ones in accord with which we usually investigate [friendship] in our accounts[91]—are determined. For a friend seems to be the one who wishes good things to someone, or the sorts of things he thinks are good, not because of himself, but for the sake of the other. But in another way, if one wishes that the other exist because of himself and not because of oneself, even if not apportioning good things to him, let alone existence, one would most of all seem to love him. In another way, if he is the one with whom one chooses to live because of his company and not because of something else. For example, fathers choose that their children exist, but live with other people. All these views, of course, clash with each other; for some people do not think they are loved if the other does not [wish good things] for them, others if he does not [wish] their existence, others if he does not [wish] to live together with them.

Further, we will suppose that sharing in the suffering of one who suffers is a mark of loving, when it is not because of something else (like slaves in relation to their masters because they are harsh when in pain) but because of the sufferers themselves, like mothers for their children and birds who share each other's suffering.[92] For the friend most wishes not just to share in the pain of his friend, but even the same pain,

91. The phrase recurs at 1244[a]21; the reference is not entirely clear.
92. *HA* 612[b]34–613[a]2.

if possible (for example, sharing in thirst if his friend is thirsty), or if not, very close to it. And the same account also applies to enjoying; for it is fitted to friendship to rejoice not because of something else but because the other is rejoicing.

Further, things of the following sort are said about friendship: "friendship is equality," and "true friends are one soul." But all of these things are ascribed to the one individual; for he in fact wishes good things to himself in this way. For no one does well for himself because of something else, or of gratitude, nor does he say he did so, insofar as he is one individual; for someone who makes it clear that he loves wishes to seem to love, but not to love. And above all existing, living together, enjoying together, suffering together, and being one soul, of course, and not being able even to live without each other, but rather dying together—for this is how it is for the one individual, and how he associates with himself. **1240^{b}1**

All these things belong to the good person in relation to himself. But in the wicked one they are in discord, as they are in the person who lacks self-control. And that is why it seems possible for one even to be one's own enemy. Insofar as a person is one and undivided, however, he is an object of desire to himself. And the good person and the friend in accord with virtue are of this sort, since the wicked person, at any rate, is not one but many, and in the same day becomes another person and is unstable. So even a person's love for himself is referred back to that for the good; for it is because he is in a way the same, one, and good for himself that he is thereby a friend to, and an object of desire to, himself. And a person is of this sort by nature, while the wicked one is contrary to nature.

And a good person does not reproach himself at once either, like the one who lacks self-control, nor does his later self reproach his earlier self, like the person who is full of regrets, nor his earlier self his later one, like the person who makes a false promise (in general, if one must draw the distinctions the sophists draw, it is like Coriscus and excellent Coriscus; for it is clear that their quantity of excellence is the same), since, when people bring a charge against themselves, they are condemning themselves to death. But it seems that everyone is good to himself. And the unconditionally good person seeks to be a friend to himself as well, as has been said, because he has two things within himself that by nature wish to be friendly and impossible to split apart. That is why, in the human case, each self seems to be a friend to itself. But not in the case of the other animals—for example, a horse [does not seem to be any of these things] to itself; and it is not, therefore, a friend [to itself]. But it is not so in the case of children either, though once they have deliberate choice it is; for only at that time is the child[93] in discord with appetite. The friendship one has for oneself, for its part, seems akin to that in accord with family ties; for in neither case is it up to the parties themselves to dissolve it, but rather, even if they differ, in the one case they are still family members, and in the other one is still one person for as long as one lives.

93. Or, more exactly, the understanding of the now adult child.

In how many ways, then, things are said to love, and that all the forms of friendship are referred back to the primary form, is clear from what has been said.

7.7
Friendship, Concord, and Goodwill

1241a1 It properly belongs to our investigation to get a theoretical grasp on both concord and goodwill. For it seems to some people that they are the same thing [as friendship], to others that they do not exist without each other.

Goodwill is neither altogether other than friendship nor the same thing. For, given that friendship is divided into three modes, goodwill is not present either in that due to utility or in that in accord with pleasure. For if one wishes good things for someone because it is useful, one would be wishing them not because of him but because of oneself, and it seems that, just as in the case of friendship, goodwill is not for oneself, the one who has the goodwill, but for the person one has goodwill for. And if goodwill were present in friendship for the pleasant, there would also be goodwill for inanimate things. So it is clear that goodwill has to do with character friendship. But while wishing alone is a mark of the person of goodwill, the friend must also do in action what he wishes. For goodwill is the starting-point of friendship; for every friend has goodwill, but not everyone who has goodwill is a friend; for the one with goodwill is like one who starts out, which is why it is a starting-point of friendship, but not friendship.

Friends seem indeed to be in concord and those in concord to be friends. But the concord fitted to friendship is not concerned with everything, but with the things doable in action by the ones in concord, and those that contribute to their living together. And it is not only concord with respect to thought or with respect to desire; for it is possible for what moves us to appetitively desire contrary things [to what thought prescribes], just as in the person who lacks self-control there is discordance. Nor is it the case that if there is concord with respect to deliberate choice, there is also concord with respect to appetite. But concord is found among good people—at any rate, when base ones deliberately choose and have an appetite for the same things, they harm each other.[94]

And it seems that concord is not said of things in a simple way, any more than friendship is. Instead, though the primary and natural sort is excellent (which is why it is not possible for base people to be in concord), there is another sort in accord with which even base people are in concord, whenever they have a deliberate choice and an appetite for the same things. But they must desire the same things in such a way that

94. Because they are then in selfish competition for the same appetite-satisfying things. See *NE* 1168a30–35.

it is possible for both to get what they desire; for if they desire the sort of thing that it is not possible for both to have, they will fight, while those in concord will not fight.

There is concord too whenever the deliberate choice of ruling and being ruled is the same, not each deliberately choosing himself, but both choosing the same person. And [this] concord is political friendship.

About concord and goodwill, then, let this much be said.

7.8
Benefactors and Beneficiaries

A puzzle arises as to why those who benefit others love their beneficiaries more than the beneficiaries love their benefactors, while the contrary seems to be just. And one might suppose that this comes about because of what is useful and what is beneficial to the person; for something is owed to the one and the other must make a return. But it is not only that this does happen; it is also natural. For the activity is more choiceworthy, and here the work and the activity have the same account, and the beneficiary is, as it were, the work of the benefactor. That is why even in animals there is concern for offspring, both in begetting them and in preserving them once they are born. And fathers (and mothers more than fathers) love their offspring more than they are loved. And these in turn love their own offspring more than they love their parents, because the activity is the best thing. And mothers love more than fathers because they think that the offspring are more their own work; for people determine work by its difficulty and the mother suffers more in childbirth.

7.9
Friendships and Communities

Also, as regards friendship with oneself and within a group, let it be determined this way. It seems both that the just is a sort of equality and that friendship consists in equality, if it is not said pointlessly that "friendship is equality." And all constitutions involve a form of justice; for they are a community, and everything that is common is established by means of justice. So there are as many forms of justice and of community as there are of friendship, and all these border on each other and exhibit nearly the same difference. But since the relations of soul to body, of craftsman to instrument, and of master to slave are all alike, there is no community between these; for they are not two, but rather one, and the other is part of the one. Nor is what is good for each of them divided, but rather the good of the one for whose sake the other exists is good for both of them; for the body is in effect an innate instrument; a slave is a sort of part and detached instrument of his master; and an instrument is a sort of inanimate slave.

And the other communities are part of the city's communities—for example, that of the clans, the religious cults, or the crafts of wealth acquisition. And all the constitutions co-exist among family members, both the correct constitutions and the deviant ones (for it is just the same in constitutions as it is in the case of musical harmonies): kingship is that of the father, aristocracy that of husband and wife, while that of brothers is a polity. And deviations from these are tyranny, oligarchy, and democracy. There are, then, that many sorts of justice.

But since some equality is arithmetic and some proportional, there will also be forms of justice, friendship, and community. For the democratic community[95] and companionate friendship are arithmetic; for they are measured by the same defining mark. But the aristocratic one, which is best, and the kingly one are proportional. For it is not the same thing that is just for superior and inferior, but rather what is proportional. The friendship of father and son is like that, and in communities it is the same way.

7.10
Political Friendship

1242a1 Friendships are said to be familial, companionate, or communal (so-called political friendship).

Familial friendship, for its part, is of many forms, one that of brothers, another that between father and sons (for it is both proportional, like paternal friendship, and arithmetic, like that of brothers; for the latter is close to companionate friendship; for there too they claim privileges of seniority). Political friendship, on the other hand, is most certainly established in accord with utility; for people seem to come together because they are not self-sufficient, since they would have come together, at any rate, even for the sake of living together. Only political friendship and the deviation from it are not merely friendships, but it is also as friends that people are community members, while the other friendships are in accord with superiority. But the justice in utility friendship is most of all justice, because it is political justice; for a saw and a craft come together in another way, not for the sake of something common (for then an instrument and a soul would be a whole) but for the sake of the user. But it also happens that instrument itself gets care of the sort that is just in relation to its work; for it exists for the sake of the latter. And the being for a drill is twofold, of which the one in the fuller sense is the activity, the drilling. And in this form are included the body and the slave, as was said previously.[96]

To investigate how one should associate with one's friend, then, is to investigate a sort of justice. For, in general, the entirety of justice is in fact in relation to a friend;

95. Reading ἡ δημοκρατικὴ κοινωνία.
96. 1241b18–23.

for what is just is so for certain people, that is, for community members, and a friend is a community member, of the family in one case, of life in the other. For a human being is not only a political animal, but also a household-managing one, and, unlike the other animals, which, whether male or female, copulate in season with just any random partner, but otherwise are solitary throughout life; on the contrary, a human is an animal disposed to form a community with those with whom it is by nature of the same kind. Therefore, there would be both a community and a sort of justice, even if there were not a city. And a household is a sort of friendship.

The relationship between master and slave, then, is the very same as between craft and instruments, soul and body, but such relationships are neither friendships nor sorts of justice, but something analogous, just as the healthy is not just but something analogous. But between wife and husband there is friendship as something useful and a community. And the friendship of father and son is the very same as that of god to human, benefactor to beneficiary, and, in general, of what is by nature a ruler to what is by nature ruled. But that of brothers for each other in accord with equality is above all companionate:

> For never was I proved by him to be a bastard,
> But for both of us the father was declared the same,
> My ruler, Zeus.[97]

For this is what is said by people seeking equality. That is why it is in the household that one first finds the starting-points and sources of friendship, constitution, and justice.

But since there are three forms of friendship (in accord with virtue, with utility, and with pleasure) and each of these has two different varieties (for each of these is in accord with either superiority or with equality), and the just in each of them is clear from the disputes, [it follows that] in the friendship in accord with superiority the friends claim what is proportional, but not in the same way; instead, the superior person claims what is inversely proportional, that as he stands to the inferior, so too what comes from the inferior stands to what he provides, his position being like that of ruler in relation to ruled. But if this is not the case, at all events, he claims what is numerically equal. (And it is especially like this in other communities too; for sometimes their shares are numerically equal, while at other times they are equal in ratio; for if each contributes a numerically equal amount of silver, they make an equal division, that is, a numerically equal one. But if it is unequal, then a proportional one.) The inferior person, on the contrary, inverts the proportion, and couples diagonally.[98]

97. Sophocles, Fr. 688 Nauck.

98. The four points of the square are the superior, the inferior, the superior's contribution, and the inferior's contribution. The superior thinks that the inferior should contribute more than he does, in proportion to his own superiority; the inferior wants the services rendered to be equal, and thus couples, or equalizes, the points represented by the two contributions.

But in this way the superior person would seem to come out worse and the friendship and the community to be a public service. One must, therefore, equalize and produce a proportion by means of something else. And this is honor, which is precisely the thing that belongs by nature to the ruler—and to the god—in relation to the ruled. And the profit must be equalized relative to the honor.

The friendship that is in accord with equality is political friendship. And political friendship is in accord with utility, and just as cities are friends with each other, so too are the citizens as well and in like fashion: "The Athenians no longer know the Megarians."[99] Neither do the citizens when they are not useful to each other, but rather their friendship is a hand-to-hand exchange. And here too there is a ruler and a ruled, though neither natural nor kingly ones, but taking turns. And it is not for the sake of conferring a benefit, like a god, but in order that there be equal sharing in the good and in public service. Political friendship, then, tends to be in accord with equality.
